 12134 Heads umbellate, Stem simple, Lvs. downy : radical ovate subcrenulate ; cauline lanc. entire
 12135 Heads in corymbose umbels, Stem simple, Lvs. somewhat toothed : radic. spatulate ; caul. obl. lanc.
 12136 Panicle few-headed, Stem simple, Lvs. all stalked cordate doubly toothed, Petioles toothed at base
 12137 Heads corymbose, Lvs. pinnated : term. pinnæ large cordate cut-toothed ; lateral cuneate toothed at end
 12138 Heads paniced, Invol. downy, Lvs. pinnatifid : segments blunt about 3-lobed downy beneath
 12139 Heads paniced, Lvs. pinnatifid subvillous : segments sinuated, Stem herbaceous
 12140 Pedunc. 1-headed axillary, Lvs. linear subulate glabrous, Stem shrubby
 12141 Pedunc. 1-headed, Lvs. reniform somewhat angular, Petioles auricled at end or naked
 12142 Pedunc. 1-headed, Lvs. pinnatifid lobed acute viscid fleshy
 12143 Pedunc. 1-headed, Lvs. cordate roundish with 7 angles woolly beneath
 12144 Pedunc. 1-headed, Lvs. opposite ovate naked

12145 Leaves cuneate cut-toothed at end

12146 The only species

- 12147 Lvs. amplexic. somewhat toothed ovate rugged downy beneath, Scales of the involucre downy
 12148 Leaves amplexic. oblong entire hirsute, Stem pilose corymbose
 12149 Leaves amplexic. lanc. serrated at base pilose beneath, Stem corymbose villous
 12150 Leaves amplexic. cordate lanceolate wavy
 12151 Leaves amplexic. cordate lanc. quite smooth serrated, Stem corymbose smooth, Pedunc. 1-headed filiform
 12152 Leaves oval rigid sessile serrulate scabrous netted, Scales of invol. ovate reflexed
 12153 Leaves sessile reflexed at base lanc. serrated, Stem downy clammy, Peduncles axillary leafy
 12154 Leaves sessile lanc.-lin. Stem pilose branched, Branches spreading 1-headed, Root tuberous
 12155 Leaves lanc. recurved serrate scabrous, Branches angular, Lower heads tallest
 12156 Lvs. sess. obl. obliquely serrated : serratures glandular, Stem hairy 1-headed, Scales of invol. lanc. villous
 12157 Lvs. sess. obl. with cartilaginous teeth scabrous rigid, Stem corymbose, Scales of invol. blunt squarose
 12158 Lvs. sessile lanc. bluntly serrated rigid pilose, Stem villous 1-headed, Scales of invol. lanceolate
 12159 Leaves ellipt. narrowed at base stalked pilose : lower toothed, Stem many-flowered
 12160 Leaves sessile oblong lanc. serrated downy beneath, Heads stalked about 4 in terminal umbels
 12161 Leaves lanc. acute serrulate hairy, Lvs. of invol. lanc. hairy outer reflexed
 12162 Leaves amplexicaul. toothed very hairy : radical ovate ; cauline lanceolate
 12163 Leaves sessile oblong lanc. attenuated at base obtuse entire mucronate with a gland, Pedunc. fl. if. viscid
 12164 Leaves sessile obl. acute entire scabrous, Stem branched at top, Heads corymbose
 12165 Leaves sessile lin. acuminate nerved smooth scattered, Stem about 1-headed
 12166 Leaves linear fleshy generally 3-pointed
 12167 Leaves subserrate downy beneath : radical stalked ovate, Stem erect 1-flowered
 12168 Leaves lanc. hirsute entire, Stem 1-headed, Invol. short imbricated

and Miscellaneous Particulars.

a preserve with sugar. Inuleæ in many respects re-semble Anthemidææ, Senecionææ, and Nassauviææ, especially in their style; but they are perfectly well characterized by the peculiarities of their ovarium, pappus, stamens, and corolla. They are also related to Carlinææ. They are found in every part of the world, and especially in southern Africa; almost all the Composite of the southern latitudes being referable to them.

1. *Helenium*, called *Elecampane*, from the officinal name *Enula campana*, is one of the largest of British herbaceous plants. It was formerly esteemed a tonic, and is still retained in the *Materia Medica*, though little used. Bruised and macerated in wine, with balls of ashes and whortle berries, it dyes a blue color. The young branches of *I. Crithmifolia* are frequently sold in the London markets for *samphire*, to which they bear some resemblance in appearance, but none in virtues.

History, Use, Propagation, Culture.

1745. *Pulicaria*. So named in allusion to its property of driving away fleas, *pulices*. See Conyza. *P. dysenterica* has its specific name from having cured certain Russian soldiers of the bloody flux. It is called by our old authors middle flea-bane, and was supposed by its smoke in burning to chase away fleas and other insects. Forskahl says, it is named in Arabic *Rava ejub*, or *Job's tears*, from a notion that Job used a decoction of this herb to cure his ulcers. Of course it was formerly recommended to cure the itch. *P. vulgaris* is also said to drive away fleas and gnats.

1746. *Grindelia*. A handsome genus of herbaceous plants, with neat foliage, and pretty yellow flowers. They are sometimes called *Donia*.

1747. *Podolepis*. From *πυς*, a foot, and *λεπις*, a scale. The stalks of the flowers are covered with scales.

1748. *Chætanthera*. From *χαιτα*, hair, and *ανθησα*, an anther, the anther being furnished with a hairy tuft.

1749. *Arnica*. This is said to be a corruption of *ptarmica*, derived from *πταρμις*, to sneeze. The *Arnica montana* is a powerful sternutatory; in the Vosses it is even called *tabac* on that account. The whole plant has important medicinal properties; it is fortifying, diuretic, emmenagogue, vulnerary, antiseptic, resolutive, and sternutatory. The root powdered is employed in diarrhœa, dysentery, and quartan fevers; it is also applied outwardly to bad ulcers, and in cases of gangrene. The flour is used in asthenia, rheumatic pains,

- 12169 Leaves ovate-oblong decurrent toothed entire at end, Flowers corymbose clustered
 12170 Leaves sessile opp. linear lanc. entire dotted beneath, Pedunc. long 1-headed
 12171 Leaves lanceolate linear entire, Corymbs branched, Rays of flowers very short
- 12172 Leaves amplexicaul. oblong wavy villous, Stem erect paniced, Pedunc. 1-fl. oposite the leaves
 12173 Leaves oblong sessile, Pedunc. filiform, Invol. cylindrical
 12174 Leaves oblongo-cordate amplexic. rugged downy, Stem woolly paniced, Scales of involucre setaceous
- 12175 Leaves ovate-obl. serrated, Involucre viscid
 12176 Leaves sessile obl. lanceolate acute serrated at end not viscid
 12177 Leaves obl. amplexicaul. serrated, Scales of involucre filiform at end revolute squarrose
 12178 Stems simple, Lower leaves spatulate : upper linear-oblong serrated 1-nerved
 12179 Leaves oblong blunt half-amplexicaul. ciliate serrated, Leaves of invol. linear flat bristle-pointed
- 12180 Scales of invol. rugose blunt, Stem quite simple
 12181 Scales of invol. equal ovate acuminate, Stem nearly simple
- 12182 Leaves lanceolate ciliated
- 12183 Leaves ovate entire : cauline twin opposite
 12184 Leaves toothed, Teeth acuminate : radical stalked elliptical roundish ; cauline alternate oblong
 12185 Leaves remotely toothed hirsute : radical stalked obl. narrowed at base ; caul. alternate obl. lanceolate
 12186 Scape 1-headed naked, Leaves stalked obovate repand
 12187 Leaves somewhat toothed and hairy : radical stalked obl. rounded at base ; caul. altern. obl. lanceolate
- 12188 Leaves obovate crenate smooth, Scape 1-headed
- 12189 Leaves cordate repando-dentate : radical ones petiolate ; cauline ones amplexicaul.
 12190 Leaves remotely toothletted : upper oblong amplexicaul ; lower ovate stalked, Petioles winged auricled
 12191 Leaves toothletted : upper lanc. amplexicaul ; lower spatulate ovate ; radical cordate stalked
 12192 Leaves toothed obov. amplexic. : radical obov. spatulate narrowed into the stalk, Stem simple 1-headed
 12193 Smooth, Radical leaves cordate deeply toothed ; cauline oblong amplexicaul. Stem about 1-headed
 12194 Downy, Lower leaves stalked ovate with winged petioles : upper amplexicaul. ; all toothed
- 12195 Leaves stalked or ovate toothed subsinate at base downy beneath : the old ones quite smooth
- 12196 The only species
- 12197 The only species
- 12198 Leaves serrated quite smooth
 12199 Leaves serrated downy
 12200 Lower leaves pinnatifid : upper entire smooth, Florets of disk 4-toothed
 12201 Leaves lanceolate decurrent, Ray of corolla 4-parted

and Miscellaneous Particulars.

bruises, gutta serena, and paralysis of the bladder. The root is given in doses of six to twelve grains ; the flowers of from three to four grains. Dr. Thomson observes, that in the hands of British practitioners it has not merited the eulogium of the French and German. (*Lond. Disp.* p. 169.)

1750. *Gerberia*. T. Gerber, a German naturalist, is only known as a traveller in Russia. A very pretty little greenhouse plant with neat purple flowers.

1751. *Doronium*. Derived from the Arabic name *Doronigi*. *Pardalianches* is from *παρδαλις*, a tiger, and *αγχις*, to strangle ; on account of the use said formerly to have been made of the plant for the purpose of destroying wild animals.

1752. *Perdicium*. A name given by Pliny to a plant of which the partridge ; *perdiris*, is very fond. The plant is not now recognized.

1753. *T. tragonotheca*. From *τετρα*, four, *γωνια*, an angle, and *θρακη*, a capsule, in allusion to the four angles of the grains.

1754. *Ximenesia*. Named by the Abbé Cavanilles, after Joseph Ximenez, a Spanish apothecary, who is said to have attended to plants.

1755. *Helenium*. Named after the celebrated Helen, who is said to have availed herself of the cosmetic properties of the plant named after her. That is believed to be the modern *Inula Helenium* ; the ancient name being unoccupied, it has been applied to this American genus, which resembles the other.

History, Use, Propagation, Culture,

1756. *Bellis*. So called from *bellus*, pretty. Every one knows the daisy.
 1757. *Bellium*. See *Bellis*, from which this genus differs chiefly in the pappus of the grains.
 1758. *Dahlia*. Named after Andrew Dahl, a Swedish botanist, and pupil of Linnaeus. Continental botanists call the genus *Georgina*. This genus grows in Mexico, in sandy meadows, and till the peace of 1814 was more cultivated in France than in England; at present it is one of the most fashionable hardy plants. Though its leaves are coarse, resembling those of the common dwarf elder, yet the flowers are showy, and continue in beauty till late in autumn. The plants grow freely in any soil or situation; but the poorer the ground is, the smaller the size of the plant, and the earlier and more abundant the flowers. The single-flowered varieties of *D. superflua* are almost without end; the double varieties of both species are much less numerous. Any number of the former may be raised from seeds, which ripen in abundance, and if sown in February on artificial heat, and transplanted in the end of April, they will flower in the July or August following. The double varieties are increased by dividing the roots, or by grafting, or by cuttings; they may also be sometimes raised from seeds. A very general way in which both kinds are propagated is by cuttings. They may be either taken from the root-shoots in spring, or the tops of the young shoots early in summer; the lower end of each cutting should be cut smoothly off in the middle of a joint, and all the leaves left on, excepting those that would be buried in planting the cutting. If planted in sandy soil, on a gentle bottom heat, and covered with a hand-glass, they will soon strike root, and produce both flowers and tubers the same autumn. The double sorts are grafted on tubers of the single varieties much in the manner of whip-grafting, but without a tongue, at the bottom of the part so cut, a ledge, whereon to rest the graft; next, cut the scion sloping to fit, it should contain two joints, and be cut so that one of these may be at the bottom of it to rest on the ledge; from that joint the scion will occasionally put forth roots; from the other the future stem will be formed. Having tied the graft, clay it as in common grafting; then put the root in fine mould, burying half the graft, and place the pot in a gentle moist heat under a glass. If this be done in March, the plant may be shifted into a larger pot in April, and planted out in the end of May.
 As the *Dahlia* is a bulky plant, it requires either to be grown in a very large pot, or in from three quarters to a yard and a half of surface. They look well in rows, or occurring singly in a shrubbery.
 The treatment of the *Dahlia* bears a considerable resemblance to that of the potato and the marvel of Peru; as soon as the frost has blackened the tops of these three plants, their roots require to be taken up, and

12202 Scape naked single-headed, Leaves obovate crenate

12203 Scape naked single-headed, Leaves obovate crenate 3-nerved

12204 Stem somewhat leafy

12221 Leaves linear sessile acute ciliated at base

12222 Stem filiform branched, Leaves woolly subulate filiform, Peduncles naked axillary 1-headed

and Miscellaneous Particulars.

kept in a dry place, where the frost cannot get at them till spring. About April they may be divided, and planted in the open air where they are to flower; or, what is more common planted in large pots, and forwarded in heat till the middle of May, when they may be turned out of the pots where they are finally to remain. In this case they will flower a month or six weeks earlier than by the other method, and will, in general, continue flowering till they are destroyed by frost. Some care is requisite to preserve the roots sufficiently moist and plump to maintain the living principle, and yet not to rot, shrivel, or freeze them. The safest mode is to plant them in pots or boxes of dry earth, and place them in a shed or cellar, or under an ample covering of litter thatched over.

1759. *Berbera*. Berber is said by Willdenow to have been a learned Russian botanist.

1760. *Tagetes*. Named after Tages, a Tuscan divinity, the son of Genius, and the grandson of Jupiter. *T. patula* is a tender annual, deservedly popular, from the brilliancy and variegation of its flowers: it is cultivated in Japan, China, and many parts of India, but does not appear to be indigenous of those countries. The varieties of *T. erecta* differ chiefly in the shades of the same color, but there are also double and quilled flowers. Both species are raised from seeds, upon a moderate hot-bed, in the beginning of April, and when they are three inches high, transplanted to where they are finally to remain. The varieties are very apt to degenerate, and can only be reproduced by the most careful selection and separation.

This genus serves for the basis of M. Cassini's *Tagetines*, which do not appear to be at all distinct from *Helianthus*, from which they differ principally in the form of their ovarium. M. Cassini's principal motive for distinguishing them as a separate race, seems to have been his wish to reduce his tribe of *Heliantheae*, which he finds too extensive. Nearly all the species are found in America.

1761. *Heterospermum*. From *ἕτερος*, various, and *σπέρμα*, seed; on account of the variable shape of the grains.

1762. *Schkuhria*. Named in honour of Christian Schkuhr, an acute German botanist, who has published some of the most accurate and useful, if not splendid, botanical works which the world has seen. It is to be regretted that their rarity makes them more generally unknown than they deserve to be.

1763. *Pectis*. From *pecten*, a comb, to which the teeth of the pappus may be compared.

1764. *Longchampsia*. So named after Doctor J. L. A. Loiseleur Deslongchamps, a French botanist, author of a useful *Flora Gallica*, in two small duodecimo volumes, published at Paris, the first in 1806, the second in 1807.

History, Use, Propagation, Culture,

1765. *Leysera*. So called in honor of Frederick William Leyser, a German, and author of a *Flora Halensis* in 1783.

1766. *Selloa*. Named after Mr. Sello, a German botanist, employed by the Prussian government in collecting materials for a natural history of Brazil. An uninteresting stove perennial plant, remarkable for having florets mixed among the leaves of the involucre.

1767. *Relhania*. In honor of the Rev. Richard Relhan, an English botanist, and author of a *Flora Cantabrigiensi*. The genus was named by L'Heritier. Plants of no beauty and easy culture.

1768. *Zinnia*. John Godfrey Zinn, a German, published, in 1757, a Catalogue of the Plants in the Garden of Gottingen, &c. Handsome border annuals, with persistent flowers, of the same culture as *Tagetes*.

1769. *Chrysanthemum*. From *χρυσος*, gold, and *ανθος*, a flower; because many of the kinds bear flowers of a yellow color. *Chrysanthemum*, Fr., *Goldblume*, Ger., and *Crisantero*, Ital. C. sinense is one of the handsomest of autumnal flowers, and of the easiest possible culture in any soil. It is a popular flower in China, whence all our numerous varieties have very recently been obtained, and chiefly through the exertions of the Horticultural Society. These are certainly a very great addition to the beauties of the flower garden in a dry autumn, and to the green-house or conservatory in the wet and foggy months of November and December, when scarcely any thing else is in flower. The plants are propagated by divisions, by suckers, and by cuttings;

12223 Leaves linear subulate ciliate rough, Scales of invol. lanceolate

12224 Leaves filiform downy, Scales of invol. membranous reflexed

12225 The only species

12226 Leaves oblong acuminate nerveless recurved at end

12227 Leaves linear somewhat pungent striated beneath, Heads sessile

12228 Leaves linear villous, Pedunc. lateral shorter than leaf

12229 Heads sessile, Leaves opp. cordate-lanceolate amplexicaul. sessile

12230 Heads stalked, Leaves opp. ovate-lanceolate somewhat stalked

12231 Heads stalked, Leaves whorled ovate-lanceolate stalked, Ray double

12232 Heads stalked, Leaves opp. cordate ovate sessile amplexicaul. Stem hairy, Paleae serrated

12233 Heads stalked, Leaves opp. cordate lanceolate stalked, Ray linear-lanceolate reflexed

12234 Leaves cordate sessile rough at edge, Grains of disk with 2 awns: of the ray awnless

12235 Leaves smooth attenuated at base pinnatifid: segments cut

12236 Leaves all cuneiform oblong finely serrated, Stem simple 1-headed erect

12237 Leaves sessile: lower linear lanceolate serrated; upper spatulate

12238 Leaves amplexic. obl. obt. cut pinnatifid at base; radical ones obovate petiole, Stem erect branched

12239 Lower leaves stalked spatulate serrate: upper lin. lanc. serrated, Stem 1-headed

12240 Leaves pinnated: pinnae linear acute, Stem erect 1-headed

12241 Leaves linear nearly entire, Stem quite simple

12242 Lower leaves palmated: leaflets linear pinnatifid

12243 Leaves bipinnate: pinnae oblong serrated, Heads corymbose

12244 Leaves bipinnate hoary: leaflets acute entire, Stem 1-headed simple

12245 Radical leaves 3-parted cut-toothed: cauline cuneiform 3-parted blunt

12246 Leaves bipinnated fleshy smooth, Scales of invol. keeled

12247 Leaves bipinnated linear subulate smooth, Stem erect somewhat branched

12248 Very near *C. leucanthemum*, but the lower leaves are more spatulate

12249 Leaves amplexic. glaucous inciso-serrate above toothed at the base

12250 Leaves lingulate blunt serrated, Scales of involucre equal

12251 Leaves bipinnate serrated, Rays length of disk, Stem procurrent

12252 Leaves bipinnatifid acute broadest externally, Stem branched

12253 Leaves flaccid stalked pinnatifid finely toothed: upper entire, Ray a little longer than flower

12254 Leaves coriaceous stalked sinuate-pinnatifid toothed glaucous, Ray very long

44 Double White Indian

and Miscellaneous Particulars.

as they are very apt, in every case, to throw up suckers, the latter mode is decidedly the best. The cuttings may be taken from the side branches at any season from April to September; taken off before the end of May, they will flower the succeeding autumn; those taken off afterwards will not flower till next year. *Chrysanthemum* are so very prolific in suckers, that they soon become unsightly plants, and produce small and degenerate blossoms, unless frequently renewed from cuttings. The Chinese are said to do this every year; they take off the cuttings in May, strike them as we do, and then put each plant in a very small pot, in which it flowers the succeeding autumn. The plants are thus kept in a dwarf state, and clothed with green foliage from the ground to the flower. In order that the blossoms may be strong, they leave only one or two flower-buds on the summit of each plant, and they remove all suckers and side shoots till the blossom is over. This mode is now generally adopted with us; but sometimes the plants are retained a second, or even a third year, in which case care is requisite to leave no more stems, and to have no more suckers growing at one time than the roots can support in a vigorous state. As under this management the stems attain a great height, they require to be supported by a rod, and adjusted so as to form a symmetrical figure by a nice application of black threads, or small copper wires.

Sometimes the *Chrysanthemum* is grown in beds or borders, in which case the plants should be taken up every year, and their superfluous suckers removed; or, which is better, they should be totally renewed by cuttings

History, Use, Propagation, Culture,

Though these plants will grow in any soil, yet when in small pots they require a rich loam, and are the better for being watered, as in China, with liquid manure. The different varieties are well described by Mr. Sabine, in the fourth and fifth volumes of the Horticultural Transactions.

1770. *Pyrethrum*. An ancient Greek name, applied to this plant from its supposed resemblance to the *ρυεθρον* of Dioscorides. That plant is believed to have been the *Anthemis pyrethrum*, or Pellitory of Spain, of the moderns, and to have received its name from the burning qualities of its root; *ρυεθρον*, fire. All the plant of *Pyrethrum Parthenium* has a strong unpleasant smell, and a bitter taste. It is used externally, in the form of lotion and of poultice, and internally as an infusion for colic, hysterical affections, and weak digestion. There are some double-flowering varieties, which are very ornamental.

1771. *Matricaria*. So named on account of the use which is made of it in disorders of females. *Matricaire*, Fr., *Mutterkraut*, Ger., and *Matricaria*, Ital. It excites menstruation. Chamomille is an alteration of the

- 12255 Leaves all cuneiform oblong bluntly serrated, Stem branched diffuse
 12256 Leaves stalked serrated: lower roundish; upper ovate, Stem 1-headed
 12257 Leaves with very narrow segments, Petioles very short connate
- 12258 Leaves pinnatifid fleshy: segments linear entire, Pedunc. long corymbose
 12259 Leaves trifid fleshy: segments somewhat toothed linear blunt, Pedunc. long subcorymbose
 12260 Leaves bipinnatifid linear acute, Pedunc. 1-headed terminal
 12261 Leaves lanceolate serrated: radical oblong, Stem 1-headed
 12262 Cauline leaves lanceolate deeply toothed: radical pinnatifid, Stem 1-headed
 12263 Leaves pinnatifid: segments of the lower linear lanc. entire or bifid; upper linear entire
 12264 Leaves fleshy pinnatifid linear toothed: upper linear trifid
 12265 Leaves pinnatifid: segments lanc. somewhat 3-toothed fleshy, Pappus unequally toothed
 12266 Leaves pinnatifid: segm. lanc. deeply toothed somewhat fleshy: upper lin. toothed, Pappus uneq. toothed
 12267 Leaves downy glaucous subsessile lyrate pinnatifid unequally toothed, Heads corymbose
 12268 Leaves pinnate powdery, Leaflets pinnatifid blunt toothed, Pedunc. corymbose, Pappus toothed
 12269 Leaves woolly bipinnate, Pinnæ and pinnules obl. imbricated, Stem 1-headed, Invol. woolly
 12270 Leaves bipinnate: pinnæ lin.-filiform 2 or 3-parted, Stem erect branched, Pappus 2-lobed
 12271 Leaves pinnatifid: segm. lanc. finely serrated, Grains subulate, Pappus unequally toothed
 12272 Leaves linear serrulate, Heads corymbose
 12273 Leaves lanc.: lower serrated at end; upper entire, Branches corymbose
 12274 Leaves lanc. all deeply serrated, Stem erect branched at end
 12275 Lower leaves pinnatifid toothed: upper linear entire, Stem 1-headed
 12276 Leaves ovate obl. serrated: radical stalked; cauline sessile auricled at base, Heads corymbose
 12277 Leaves hairy subsessile pinnatifid toothed blunt, Corymb terminal compound
 12278 Leaves pinnated smooth: pinnæ once or twice pinnatifid with acute diverging segments, Invol. smooth
- 12279 Leaves bipinnate linear silky: pinnæ crossing, Pedunc. corymbose, Ray shorter than involucre
 12280 Leaves pinnated, Pinnæ lanc. pinnatifid finely serrated: upper confluent, Pedunc. corymbose
 12281 Lvs. petiol. flat bipinnate the segm. ovate cut, Pedunc. branch. corymb. Stem erect, Invol. hemispherical
 12282 Leaves pinn.: pinnæ obl. obt. pinnatifid toothed: upper confluent, Stem virgate, Heads corymbose
 12283 Leaves bipinnate: leaflets linear subulate, Stem 1-headed
 12284 Rad. leaves bipinnate: pinnæ linear pinnatifid; cauline bipinnatifid, Heads corymbose
 12285 Leaves sess. bipinnatifid with segm. capillary, Stem branched spreading, Pappus entire
 12286 Leaves bipinnatifid the segm. linear fleshy awless, Stem diffuse branched, Pappus lobed
 12287 Leaves bipinnate linear blunt, Stem ascending somewhat corymbose, Ray length of invol.
 12288 Leaves hoary bipinnate linear blunt, Stem simple, Pedunc. twin, Ray shorter than disk
 12289 Leaves pinnatifid: pinnæ cut-toothed, Pedunc. long nearly naked 1-headed, Scales of invol. blunt
- 12290 Leaves triply pinnate, Scales of invol. acute
 12291 Leaves glabrous bipinnatifid the segments capillary, Invol. nearly plane: its scales obtuse
 12292 Leaves glabrous bipinnatifid: stem branched sultrifucose
 12293 Leaves pinn. somewhat fleshy, Pinnæ linear blunt, Scales of invol. blunt, Grains margined on one side

12294 Leaves all entire
 12295 Lower leaves serrated

12296 Leaves pinnatifid glaucous beneath
 12297 Leaves stalked 5-lobed

12298 Ray short white: red on the lower surface

12299 Leaves pinnate multifid dilated, Ray none
 12300 Leaves lanc. lin. amplexicaul. pinnatifid toothed, Stem procumbent, Branches 1-headed

and Miscellaneous Particulars.

Greek *χαμαι μήλον*, a dwarf-apple, which Pliny informs us was applied to the plant, on account of its smelling of apples, or rather quinces. It is remarkable, that the Spaniards call it *manquilla*, which also means a little apple. The chamomile of medicine is another plant. See *Anthemis*.

M. Chamomilla is supposed to possess the same qualities with the official chamomile (*Anthemis nobilis*), but in an inferior degree. Most of the species, and chiefly this one, are rejected by quadrupeds.

1772. *Boltonia*. Named after I. B. Bolton, an English botanist, who wrote a work upon the Ferns of Great Britain, and another upon the fungi growing about Halifax, published in 1788-9.

1773. *Lidbeckia*. E. G. Lidbeck, a German botanist, published some works upon agricultural matters.

1774. *Cenia*. From *κενός*, empty, in allusion to its inflated calyx.

1775. *Cotula*. A diminutive of *Cota*, an old name for some species of *Anthemis*, which this resembles in miniature.

History, Use, Propagation, Culture,

1776. *Grangea*. A genus of Adanson's. The meaning of the word is unknown.

1777. *Anacyclus*. An abridgement of *Ananthocyclus*, which was the name originally proposed by Vaillant, and which does not appear to have been altered for the better. He formed it from α , privative, $\alpha\nu\delta\sigma\sigma$, a flower, and $\kappa\upsilon\lambda\lambda\sigma\sigma$, a circle; on account of the rows of ovaries without flowers, which are placed in a circle round the disk.

1778. *Anthemis*. From $\alpha\nu\delta\sigma\sigma$, a flower, on account of the multitude of flowers with which the plants are covered. *A. nobilis* is in considerable repute, both in the popular and scientific Materia Medica. The flowers, which are the parts used, have a strong and fragrant smell, and a bitter aromatic taste; both are extracted by water and alcohol. The active principles appear to be bitter extractive, resin, and essential oil. Medicinally, the flowers are considered tonic, carminative, and slightly anodyne: yet when a strong infusion of them is taken in a tepid state, it proves powerfully emetic. Given in substance, united with opium and astringents, if the bowels be easily affected, they have been successfully used for the cure of intermittents; and the infusion, in combination with ginger, or other aromatics, and the alkalies, is an excellent stomachic in dyspepsia, chlorosis, gout, flatulent cholera, and chronic debility of the intestinal canal. The tepid strong infusion is a ready emetic, and is often employed to promote the operation of other emetics. By cecction in water, the essential oil is

- 12301 Leaves lyrate pinnated, Flowers radiant
 12302 Leaves tripinnate : segm. acute, Stem erect, Heads flosculose corymbose
 12303 Stem hirsute, Leaves lyrate pinnatifid hairy, Heads terminal hemispherical
- 12304 Leaves cuneiform smooth 3-toothed stalked, Heads axill. sessile
 12305 Leaves obl. cuneate repand-toothed stalked, Heads axill. sessile
 12306 Leaves obl. sinuate toothed downy, Stem branched procumbent, Pedunc. 1-headed opp. the leaves
 12307 Leaves obovate toothed cut at base stalked, Peduncles branched
- 12308 Leaves bipinnate, Leaflets oblong, Stem procumbent
 12309 Leaves bipinnate, Leaflets linear subulate flat, Stem ascending, Peduncle naked terminal
 12310 Leaves bipinnate roundish hoary with excavated dots
 12311 Leaves decomposed linear : segm. divided roundish acute, Heads flosculose
 12312 Leaves 3-pinnate, Pinn. linear-subulate downy, Stem branched divaricating, Pedunc. thick
 12313 Leaves bipinnate linear, Pedunc. inflated, Grains winged
- 12314 Leaves bipinnatifid : segm. somewhat toothed rigid, Paleæ oblong acuminate
 12315 Leaves bipinnatifid : segm. lin. subulate toothed, Paleæ round pungent dilated at base
 12316 Leaves bipinnatifid : segm. lanc. somewhat toothed ; lower teeth reflexed, Paleæ lanc. cuspidate
 12317 Leaves bipinnatifid dotted beneath : segm. lanc. entire, Grains naked, Stem herbaceous
 12318 Snow-white, Leaves pinnate : pinnæ 3 or 5-fid, Invol. downy, Stem erect
 12319 Leaves bipinnate : pinnæ linear, Stem erect and invol. downy, Inner scales sphaerulate at end
 12320 Leaves sessile pinnatifid : segments toothed, Stem erect branched
 12321 Leaves pinnate : pinnæ linear entire subpubescent, Floral leaves simple, Branches 1-headed
 12322 Rad. leaves bipinnatifid toothed : cauline pinnatifid somewhat toothed
 12323 Leaves bipinnatifid stalked : segm. trifid oblong acute, Petioles sheathing, Sheaths toothed
 12324 Lvs. bipinn. the segm. lin. subul. a little downy, Scales of recept. membranous scarcely long, than the disk
 [entire pappus]
- 12325 Lvs. bipinnatif. their segments lin. lanc. pubesc. Recept. conical its scales lanc. Pericarps crowned with an
 12326 Recept. conical : paleæ obl. mucronate, Grains naked, Leaves bipinnate woolly
 12327 Leaves bipinnatif. glabrous their segm. subul. Receptacle conical its scales setaceous, Pappus O.
 12328 Recept. subconical, Paleæ obl. blunt, Grains naked, Lvs. bipinnate linear filiform 3-parted
 12329 Leaves pinnated downy : pinnæ linear trifid bluntish, Stem ascending, Pedunc. long naked downy
 12330 Leaves 3-pinnate : leaflets linear, Stem decumbent, Branches axillary 1-headed
 12331 Leaves hairy bipinnatifid : segments trifid lanc. linear, Stem nearly erect divided
 12332 Leaves bipinnatifid serrated downy beneath, Stem erect branched subcorymbose
 12333 Leaves bipinnate serrated smooth, Stem erect branched, Pappus membranous toothed cut on one side
 12334 Leaves pinnate : pinnæ linear 3-parted, Stem proliferous, Heads solitary axillary sessile
 12335 Leaves smooth pinnatifid : lobes cuneate trifid or cut, Heads solitary
 12336 Leaves bipinnatifid dotted beneath : segments entire, Crown of grains toothed
 12337 Leaves woolly bipinnate : pinnæ lanc. acute, Flowering branches corymbose, Recept. conical
 12338 Leaves stalked silky bipinnate : segm. linear acute, Invol. downy, Rays ovate
 12339 Leaves linear sessile pinnatifid : segm. entire, Stem erect branched
 12340 Leaves sessile pinnatifid : segm. linear subulate pectinate entire, Stem downy 1-headed
 12341 Leaves pinnated : pinnæ linear entire blunt, Stem downy 1-headed
 12342 Leaves pinnated revolute at edge : segm. lin. subul. subtrifid, Upper scales of invol. blunt with a membran
 [edge]

12343 The only species, resembling a *Calendula*

12344 Stem procumbent, Leaves ovate entire

and Miscellaneous *Paniculars*.

dissipated : chamomile flowers, therefore, ought never to be ordered in decoctions. Externally, they are used as fomentations in cholick, intestinal inflammation, and to phagedenic ulcers : and their infusion is also found to be a useful addition to emollient anodyne glysters in flatulent cholick, and in irritations of the rectum producing tenesmus. (*London Disp.* p. 158.) There is a double variety generally grown for the apothecaries ; it is more ornamental than the single, but much less efficacious as a medicine.

A. cotula is said by Linnæus to be a very grateful plant to toads ; to drive away fleas, and to annoy bees. It is a very common weed on soft rich soils and dunghills, and increases by seeds with amazing rapidity. The tribe of Anthemideæ, of which this genus is the example, are nearly related to Heliantheæ. In their style they resemble Inuleæ, Senecioneæ, and Nassauviæ, but their floral organs are different. They inhabit Europe, Asia, and Africa, scarcely one has been found in America, or the southern parts of the world.

1779. *Centrospermum*. From *σπείρον*, a spur, and *σπίρον*, a seed, in allusion to the spiny points of the pappus. A small annual plant with the aspect of *Calendula*

1780. *Sinimitalia*. Named by Linnæus without any explanation. A hardy annual plant, with flowers having a yellow ray and dark purple disk, like some species of *Rudbeckia*.

History, Use, Propagation, Culture

1781. *Achillea*. Named after Achilles, a disciple of Chiron, and the first physician who used it in healing wounds. *A. Ptarmica* is called sneeze-wort, because the dried powder of the leaves snuffed up the nostrils provokes sneezing. In the spring, the young tender shoots were formerly put into salads, to correct the coldness of other herbs. There is a variety with double flowers, which is very ornamental, especially in pots. *A. moschata*, the *Gentipi* of the Swiss, is an excellent sudorific, aromatic, and acrid, and is a grateful food to cattle.

- 12345 Leaves obl. linear blunt doubly serrated downy ciliated, Stem villous
 12346 Leaves linear narrowed at base serrated and stem smooth [at end
 12347 Leaves lin. acute equally and finely serrulate smooth, Stem paniced, Corymbs few-headed, Paleæ bifid
 12348 Leaves linear lanc. acuminate sharply serrated
- 12349 Leaves lin. plane acuminate toothed : teeth emarginate transversely ciliated, Stem diffuse
 12350 Leaves obl. blunt serrated narrowed into the petiole fascicled glabrous, Corymb compound contracted
 12351 Leaves linear acuminate equally and finely serrated smooth : serratures of the base deepest, Paleæ entire
 12352 Leaves lanc. equally and finely serrated downy, Serratures of base deepest, Stem paniced, Paleæ entire
 12353 Leaves linear pectinate pinnatifid glabrous : segm. subserrated, Corymb compound
 12354 Leaves downy linear lanc. pinnatifid : segments deepest at base
 12355 Leaves downy pinnatifid smooth : segm. linear blunt : upper toothed at end, Corymb simple
 12356 Leaves pectinate pinnatifid smooth : segm. linear acute ; lower 2-parted, Corymb simple
 12357 Leaves pectinate pinnatifid : segm. linear subulate entire, Corymb compound contracted, Stem downy
- 12358 Leaves pinnatifid : segm. obl. cuneate unequally toothed vertically bent, Corymbs simple
 12359 Leaves pinnated roundish pilose : pinnæ 3-parted toothed imbricated across, Corymbs simple
 12360 Leaves pinnat. somew. downy, Pinnæ 3-part. blunt entire transversely imbr. Ray scarcely long. than invol.
 12361 Leaves pinnated somewhat downy, Pinnæ 3-parted transverse distant : segm. 3-toothed, Stem branched
 12362 Leaves pinnated downy : pinnæ linear entire blunt ; lowest longest, Cymes simple
 12363 Leaves pectinate pinnate smooth : pinnæ linear acuminate usually 3-parted
 12364 Leaves linear-lanc. acuminate unequally and finely biserrate villous beneath
 12365 Leaves downy pinnatifid : segm. lanc. serrated, Corymb compound
 12366 Stem downy, Leaves pinnated minutely cut acute rigid bent upwards with a downy nerve
 12367 Leaves pinnated : pinnæ long distant very narrow linear entire, Corymb compact branched
 12368 Cauline lvs. pinnatifid with entire segm. : radic. pinnatifid with 3-fid segm. Ray scarcely larger than invol.
 12369 Leaves pectinate pinnate smooth, Pinnæ linear bluntish entire dotted
 12370 Leaves pinn. villous : pinnæ toothed linear ; radical bipinnate, Stem quite simple
 12371 Leaves pinn. downy : pinnæ roundish 4-fid concave spreading, Stem branched at end
 12372 Leaves pinn. downy : pinnæ roundish bluntly toothed, Corymb compound
 12373 Leaves pinn. smooth : pinnæ lanc. cut-serrated ; outer confluent, Corymb compound
 12374 Leaves bipinnate downy : pinnæ linear-lanc. toothed, Corymb simple, Peduncles long
 12375 Leaves bipinnatifid hoary : segm. lin. lanc. serrated, Corymb compound globose, Flowers fuscous
 12376 Leaves bipinnatif. setaceous villous : segm. lanc. entire, Corymb compound contracted, Flowers fuscous.
 12377 Leaves bipinnatifid pubescent : segm. linear lanc. unequal acute, Corymb compound
 12378 Leaves downy : cauline bipinnatifid with linear blunt segm. ; radical bipinnate, Corymbs compound
 12379 Leaves bipinnatifid : segm. lanc. serrated, Corymb compound spreading
 12380 Leaves bipinnatifid : segm. lanc. cut-serrated, Rachis winged cut-serrated, Corymbs fastigate compound
 12381 Leaves bipinnatifid villous : segm. lanc. blunt, Corymbs fastigate compound
 12382 Leaves thrice pinnatifid : segm. lanc. acute, Corymbs compound fastigate
 12383 Leaves bipinnate slightly hairy their segm. linear toothed acute, Stems furrowed
- 12384 Leaves pinnatifid downy beneath : segm. toothed, Stem branched fastigate smooth
 12385 Leaves bipinnatifid downy : segm. lanc. entire, Corymb compound
 12386 Leaves bipinnatifid woolly : the segm. crowded linear acute, Corymbs repeatedly compound
 12387 Leaves subbipinnatifid : pinnæ of the base undivided : segm. lin. lanc. Corymb compound, Invol. cylindr.
 12388 Leaves bipinnatifid shorter than the intervals between them : segm. lin. entire, Corymbs comp. fastigate
 12389 Leaves bipinnatifid : segm. lin. finely serrated, Rachis winged entire, Corymb compound fastigate
 12390 Cauline leaves bipinnatifid : segm. lin. somew. toothed, Rachis winged toothed : radical thrice pinnatifid
 12391 Leaves bipinnate downy : pinnæ pinnatifid, Segments linear-subulate, Corymbs compound fastigate
 12392 Leaves bipinnate pilose beneath : pinnæ linear entire, Corymb simple
 12393 Leaves bipinnate : leaflets linear setaceous mucronate very compact pilose, Corymbs compound fastigate
 12394 Leaves bipinnate downy : pinnule very fine linear entire distant, Corymbs compound fastigate

12395 The only species

- 12396 Leaves hoary linear lanc. opposite : those of the branches alternate
 12397 Very villous, Leaves sessile oblong acuminate entire, Heads axillary on short stalks
 12398 Hoary, Lvs. bipinnatifid cut-toothed, Segm. linear rigid mucronate, Heads lateral and terminal clustered

1782. *Tridax*. From *τρίδακτος*, cut into three pieces. The rays of the flower are divided in three
 1783. *Amellus*. A name used by Virgil for a beautiful flower growing on the banks of the river *Mella*. The plant of Virgil is supposed to have been *Aster Amellus*.

History, Use, Propagation, Culture,

1784. *Starkea*. Named by Willdenow, after the Rev. Mr. Starke, of Gros Tehirna, in Silesia, who paid much attention to the Cryptogamous plants of that country. This genus was included by Linnæus in *Amellus*, from which Willdenow remarks that it differs in habit, and in its hairy receptacle.

1785. *Columella*. So called by Jacquin, after the celebrated Geoponic writer, Lucius Junius Moderatus Columella, a Spaniard, born forty-two years before Christ. A plant resembling *Amellus annua*. The flowers are yellow and sessile in the dichotomies of the branches. The *Columella* of Loureiro is a different thing.

1786. *Eclipta*. A translation of the Malay name *Wangi-wangi-maih*, which signifies an eclipse of the sun, to which the form and disposition of the radiated flower has been likened. Worthless weeds with white flowers.

1787. *Meyera*. Named after Gottlieb-Andrew Meyer, a German, who published, in 1694, a dissertation upon the *Synonorus* of Scripture.

1788. *Chrysanthellum*. A diminutive of *Chrysanthemum*, which see.

1789. *Siegesbeckia*. Dr. John George Siegesbeck, a German physician, director of the garden at St. Petersburg, published in 1736, a catalogue of it under the title of *Flora of St. Petersburg*. There was also a *Botanosophia* from his pen in 1737.

- 1239 Leaves opp. 3-nerved downy beneath, Heads in umbels
- 1240 The only species
- 12401 Stem erect strigose, Leaves oblong lanc. sessile remotely serrated
- 12402 Stem prostrate strigose, Leaves obl. lanc. somewhat stalked subserrate somewhat wavy scabrous
- 12403 Stem erect, Leaves amplexicaul. ovate toothed
- 12404 Leaves alternate 3-parted toothed: radical oblong serrated, Stem creeping
- 12405 Leaves stalked ov. unequally toothed subtriangular at base somewhat cut, Outer invol. longer than inner
- 12406 Leaves sessile ovate toothed, Florets of disk 3-toothed triandrous
- 12407 Leaves alternate decurrent wavy blunt
- 12408 Leaves alternate lanc. subserrate, Corymb compound
- 12409 Leaves alternate deeply pinnatifid, Stem shrubby
- 12410 Leaves opposite ovate lanc. serrated acuminate at each end decurrent
- 12411 Stem winged, Lvs. lanc. acuminate somewhat stalked serrated, Heads corymbose, Cor. of ray lanceolate
- 12412 Leaves opposite ovate-lanc. serrated downy beneath
- 12413 Leaves opposite cordate-lanc. amplexicaul. remotely serrated, Invol. simple 5-leaved
- 12414 Leaves opposite obl. lanc. bluish strigose serrated at end, Pedunc. 1-headed long, Invol. simple
- 12415 Leaves opposite ov. acuminate serrated 3-nerved hairy, Pedunc. winged 1-headed, Invol. simple
- 12416 Leaves opposite ov. acuminate serrated 3-nerved scabrous on each side, Pedunc. 1-headed axillary
- 12417 Leaves opposite ov. serrated 3-nerved, Heads axillary subsessile, Invol. simple, Stem trichotomous
- 12418 Leaves ovate 3-nerved serrated
- 12419 Leaves oblong lanceolate toothed 3-nerved: lower hastate 3-lobed
- 12420 Stem procumbent downy, Lvs. ovate entire, Pedunc. lateral, Ray shorter than disk
- 12421 Leaves ovate serrated 3-nerved downy beneath, Ray many-flowered
- 12422 Leaves ternate 3-lobed: lower opposite, Stem suffrutescent
- 12423 The only species
- 12424 Leaves opposite ovate serrated 3-nerved, Invol. leafy, Stem herbaceous

- 12425 Leaves opposite obovate hoary, Petioles with 2 teeth
- 12426 Leaves opposite lanceolate narrowed at base not toothed smooth

and Miscellaneous Particulars.

1790. *Verbesina*. A name with the same meaning as *Verbena*, which see. The *V. alata* resembles *Vervain* in the appearance of its foliage.

1791. *Syncretella*. A name of unknown meaning. A little worthless weed.

1792. *Galinsoga*. Named after after Mar. Ma. Galinsoga, first physician to the queen of Spain, and intendant of the garden of Madrid. One of the species, *G. trilobata*, is sometimes cultivated as a hardy annual. But it does not possess much merit.

1793. *Acemella*. From *ακαρ*, a point, on account of the pricking taste of the foliage.

1794. *Zaluzania*. Apparently an alteration of *Zaluzianskia*, a name applied in error to *Marsilea trifolia*, and formed in honor of an obscure Polish botanist.

1795. *Pascalia*. A genus dedicated by Ortega to Didan Pascal, doctor of medicine, and a professor at Parma.

1796. *Helioipsis*. A name with the same meaning, and a genus with the same habit, as *Helianthus* which see.

1797. *Bupththalmum*. From *βυς*, an ox, and *οφθαλμος*, an eye, in allusion to the broad open disk of the flowers. It is believed that the *Bupththalmum* of Pliny is a species of *Anthemis*.

History, Use, Propagation, Culture,

1798. *Helianthus*. From *ηλίοσ*, the sun, and *ανθος*, a flower. Nothing can be a more complete ideal representative of the sun, than the gigantic sun-flower, with its golden rays; it is dedicated with great propriety to the sun, which it never ceases to adore while the earth is illuminated by his light. When he sinks into the west, the flowers of *Helianthus* are turned towards him; and when he rises in the east, the flowers are again ready to be cherished by the first influence of his beams.

H. annuus is a well known border annual, which will grow in any soil. There are varieties with double flowers, the tubular florets being changed into ligular ones, like those in the ray. The whole plant, and particularly the flower, exudes a thin pellucid odoriferous resin, resembling venice turpentine. From the seeds an edible oil has been expressed, and they are also excellent food for domestic poultry. The flowers turning with the sun, is by some considered a popular error; Gerarde says he never could observe it; and Professor Martin has seen four flowers on the same stem pointing to the four cardinal points. *H. tuberosus*, *Topinambour*, Fr., *Erdäpfel*, Ger., and *Girasole*, Ital., is called Jerusalem, from the corruption of the Italian word *Girasole*; and Artichoke, from the resemblance in flavor which the tubers have to the bottoms of artichokes. These tubers are in considerable esteem on the continent as a substitute for potatoes; and before the introduction of that vegetable, they were a good deal in use in this country. Their culture and treatment is the same as for that vegetable. *H. multiflorus* a showy autumnal flower.

- 12427 Leaves opposite close spatulate oblong silky, Scales of Invol. setaceous hirsute
 12428 Leaves alternate obl. lanc. amplexicaul. entire hirsute, Invol. leafy mucronate
 12429 Invol. bluntly leafy sessile axillary, Leaves oblong blunt alternate nearly entire, Stem dichotomous
 12430 Invol. bluntly leafy stalked, Lvs. alternate spatulate, Stem herbaceous
 12431 Leaves alternate obl. lanc. subserrated 3-nerved villous, Invol. naked, Stem herbaceous
 12432 Leaves alternate lanc. somewhat toothletted smooth, Invol. naked, Stem herbaceous
 12433 Lvs. altern. lanc. serr. scabr. obsol. 3-nerv. narrow, at each end subsess. ciliat. at base, Scales of invol. lanceolate doubly serrated: upper sess. ovate serrated, Stems herbaceous

FRUSTRANEA.

- 12434 Leaves all cordate 3-nerved, Pedunc. thick, Heads cernuous
 12435 Leaves all cordate 3-nerved, Pedunc. evensized, Invol. leafy
 12436 Leaves cordate cuneate at base villous 3-nerved, Pedunc. thick fistular
 12437 Leaves ovate acuminate narrowed at base unequally serrate scabrous, Pedunc. filiform, Rays obovate
 12438 Leaves 3-nerved scabrous: lower cordate; upper ovate, Ray many-fl. Scales of invol. lanceolate
 12439 Leaves 3-nerved scabrous: lower cordate-ovate; upper ovate acum. alternate, Petioles ciliated at base
 12440 Stems slender about 1-headed, Leaves linear revolute at edge rough
 12441 Leaves ovate acuminate 3-nerved serrated scabrous above hoary beneath, Invol. squarrose
 12442 Leaves ovate acuminate 3-nerved closely serrated scabrous above: hoary and soft beneath
 12443 Lvs. ov. acum. remotely serrat. 3-nerv. scabr. Scales of invol. lanc. ciliated, Stem procomb.
 12444 Lvs. lanc. acuminate scabr. serrated 3-nerved: upper entire, Scales of invol. lanc. ciliated at base
 12445 Lvs. ovate acuminate serrated 3-nerved scabrous beneath, Scales of invol. lin. lanc. ciliated at base
 12446 Lvs. altern. lanc. serr. scabr. 3-nerved narrow, at end stalked, Petioles ciliated, Scales of invol. lanc. ciliat.
 12447 Lvs. altern. lanc. serr. scabr. obsol. 3-nerv. narrow, at each end subsess. ciliat. at base, Scales of invol. lanc. cil.
 12448 Smooth, Stem panicled, Branches few-flowered at top, Lvs. sessile very long entire: lower serrated
 12449 Stem hispid spreading, Leaves ovate rigid scabrous, Peduncles very long 1-flowered
 12450 Leaves altern. or opp. sessile linear revolute at edge entire 1-nerved, Heads corymbose
 12451 Leaves ov. lanc. acuminate serrated 3-nerved very rough on each side, Scales of invol. lin. lanc. ciliated
 12452 Leaves altern. lanc. serrated scabrous 3-nerved narrowed at each end woolly at base, Stem vill. in 2 rows
 12453 Leaves amplexicaul. Heads on long stalks, Disk of head dark purple
 12454 Stem erect hairy, Lvs. stalked 3-lobed very rough, Invol. hairy, Pappus with 2 setae
 12455 Stem smooth much branched, Lvs. opp. sessile lanc. ovate 3-nerved, Panicle trichotomous slender few-fl.
 12456 Leaves subsess. cordate ovate 3-nerved amplexicaul. closely serrated downy, Scales of invol. lanc. villous
 12457 Leaves opp. spatulate crenate 3-nerved scabrous, Scales of invol. erect the length of disk

- 12458 Leaves oblong-lanceolate subserrate, Heads 1-3, Ray 8-flowered

- 12459 Lvs. all pinnat.: one or other of the lower pinnae 2-parted; the rest undivided, Pappus ent. Stem furrowed [hispid
 12460 Rad. lvs. pinn.: leaflets sessile lanc. toothed somewhat cut; upper confluent, Pappus entire
 12461 Rad. lvs. pinn.: leaflets ovate unequal at base about 3-lobed toothed, Pappus 4-toothed
 12462 Stem upright simple few-fl. at top, Leaves pinnatifid cut: segm. linear, Invol. simple 5-leaved
 12463 Stem branched, Branches erect many-fl. Lvs. obl. lanc. acute serrated: lower 5-lobed
 12464 Leaves spatulate: lower 3-lobed; upper undivided
 12465 Leaves undivided spatulate ovate 3-nerved serrated hairy, Recept. conical, Palaeæ lanceolate
 12466 Leaves obl. lanc. toothletted hispid narrowed at base subcordate, Recept. hemispherical, Palaeæ lanceolate
 12467 Quite smooth, Peduncles long 1-headed, Lvs. ovate-lanc. acuminate each way 3-nerved
 12468 Leaves obl. lanc. cordate amplexicaul.: lower serrated, Disk cylindrical conical
 12469 Leaves lanc. ovate alternate undivided, Rays bifid
 12470 Stem hispid, Lower leaves broad-ovate tapered at base remotely toothed very rough, Rays 3-toothed

and Miscellaneous Particulars.

This genus has given rise to a most important and extensive tribe of plants, the Helianthæ, which is at once the most numerous of the various tribes of Compositæ, and on account of its strict affinity with several others, the most difficult to characterize with precision. Although it is perfectly natural, yet there is scarcely a character belonging to it which is not subject to many exceptions, and to more or less important modifications. Almost all the species of Helianthæ are natives of America, several of Asia, a few of Africa, and scarcely any of Europe. They appear to be entirely unknown in the southern parts of the world.

1799. *Gymnolomia*. From *γυμνος*, naked, and *λωμα*, an edge; in allusion to the nature of the margin of the grains.

1803. *Rudbeckia*. Named after the famous Olaus Rudbeck, professor of botany at Upsal, who died of grief in 1702, at witnessing the destruction by fire of his laborious work, called *Campi Elysi*, which was nevertheless published in 1701 and 2, by the diligence of his son. He is also celebrated for having made the discovery that the Paradise of Scripture was situated somewhere in Sweden. Handsome border annuals or perennials. *R. purpurea* is remarkable for bearing purple flowers.

History, Use, Propagation, Culture,

1801. *Galardia*. Fougereux de Bondaroy, the nephew of Duhamel, dedicated this genus to M. Gaillard de Charentonneau, an amateur of botany.

1802. *Tithonia*. A fanciful name given to this plant by Desfontaines, because of the color of its flower, which resembles Yellow Morning, or Aurora, whose husband was Tithonus.

1803. *Cosmea*. From *κοσμος*, beautiful, on account of the elegance of the foliage.

1804. *Coreopsis*. From *κορυς*, a bug, and *οψις*, resemblance. Its seed is convex on one side, and concave on the other; it has a membranous margin, and it has two little horns at the end which gives it very much the appearance of some insect. C. verticillata is a handsome shrubby plant, continuing long in flower; the florets are used in North America, to dye cloth red. C. tinctoria is a very handsome border annual.

1805. *Simsia*. Named by Persoon, after Dr. John Sims, the co-editor with Mr. König, of the excellent *Annals of Botany*, and for many years the sole editor of the *Botanical Magazine*.

12471 Stem branched, Leaves lanc. Palææ of pappus entire awned

12472 The only species

12473 Leaves pinnate and bipinnatifid, Pinnae serrated somewhat decurrent, Ray few-flowered neuter

12474 Leaves bipinnatifid : segm. lanc. Segm. of exterior invol. lanceolate
 12475 Leaves bipinnate, Leaflets linear subulate, Scales of outer invol. ovate
 12476 Leaves bipinnate, Leaflets filiform, Scales of outer invol. lanceolate

12477 Leaves bipinn. Pinnules lin. lanc. not broader than their rib

12478 Leaves whorled 3 or 5-pinnate : pinnae lin. 3-parted and undivided, Disk discolored

12479 Leaves whorled 3 or 5-pinnate : pinnae lin. 3-parted and undivided, Disk same color as ray

12480 Leaves ternate ovate-obl. serrated, Ray same color as disk

12481 Leaves serrated : radical 3-parted : cauline trifid or entire lanc. linear

12482 Leaves entire : radical pinnate ; cauline in threes lanc. stalked

12483 Leaves entire ternate sessile

12484 Leaves subternate cuneate serrated

12485 Villous, Leaves stalked quinate and ternate : leaflets ovate-lanc. subpinnatifid or cut serrated

12486 Leaves serrated ovate : upper ternate, Stem creeping

12487 Leaves lanceolate entire ciliated

12488 Rad. leaves pinnate or bipinnate entire, Outer leaves of involucre short, Ray discolored at base

12489 Leaves entire ovate : lower ternate

12490 Leaves ovate acuminate crenate toothed, Grains naked

12491 Leaves stalked lanc. ovate by degrees acuminate finely serrated, Corymbs dichotomous term. and axillary

12492 Leaves obovate oblong entire downy

12493 Leaves alternate lin. lanc. entire smooth, Ray oblong trifid : middle segm. largest

12494 Stem winged, Leaves alternate scabrous roundish ovate cuneate at base 3-nerved

12495 Leaves ellipt. acuminate serrated stalked decurrent : lower whorled ; upper alternate

12496 Leaves 3-lobed toothed roughish, Petiole naked at base

12497 Hoary, Leaves somewhat palmate 3-lobed, Petiole leafy at base amplexicaul.

12498 Leaves lanc. obsolete serrated toothed at base smooth

12499 Leaves obovate toothed villous

12500 Cor. of ray 4-fid nearly equal to disk, Leaves hoary with down

12501 The only species

12502 Leaves ovate smooth imbricated at the edge and rib ciliate-spiny, Spine of the end reflexed

12503 Leaves alternate obl. recurved smooth ciliate-spiny, Leaves of invol. ciliated

12504 Leaves altern. lanc. subulate recurved smoothish ciliat. spiny decurr. at base, Segm. of invol. ciliate spiny

12505 Cauline leaves altern. amplexicaul. ciliate spiny : radical entire unarmed, Scales of invol. entire

12506 Leaves opp. obl. lanc. narrowed at base spiny-toothed smooth, Scales of invol. ciliate spiny

12507 Leaves altern. ovate spiny-toothed 3-nerved netted hoary villous, Scales of invol. toothed spiny villous

12508 Leaves altern. obl. cuneiform spiny-toothed villous on each side, Scales of invol. toothed spiny

12509 Leaves altern. lanc. pinnatifid downy beneath : segm. entire spiny at end, Scales of invol. 3 or 5-fid

12510 Leaves opp. lanc. 3-nerved spiny-toothed downy beneath, Scales of invol. spiny-toothed [toothed

12511 Leaves altern. lanc. spiny-toothed downy beneath, Stem herbaceous 1-headed, Scales of invol. lanc. spiny-

12512 Leaves altern. lanc. amplexicaul. spiny-toothed ciliated smooth on each side, Heads cernuous

12513 Leaves altern. lanceolate oblong fleshy

12514 Leaves opp. somewhat amplexicaul. ovate

and Miscellaneous Particulars.

1806. *Osmiles*. From *οσμιν*, perfume. One of the species gives out a strong smell of Camphor.

1807. *Encelia*. A name of Adanson's, the meaning of which is unknown. A pretty half shrubby plant, with grey soft leaves.

1808. *Scelerocarpus*. From *εσληρος*, hard, and *καρπος*, fruit, with reference to the bony covering of the grain.

1809. *Cullumia*. Named after Sir Thomas Cullum, an English baronet, and one of the earliest promoters of the principles of Linnæus in this country. He is still living, at a very advanced age.

1810. *Berkheya*. Named after John Lefranc de Berkhey, a Dutch botanist.

1811. *Didelia*. From *δεις*, double, and *διπλα*, a Greek letter equivalent to the English D; because the receptacle resembles a double triangle.

History, Use, Propagation, Culture,

1812. *Gorteria*. Named after David Gorter, a Dutchman, professor of botany at Harderwyck, and afterwards physician to Elizabeth, Empress of Russia. He published a *Flora Belgica* in 1767, and assisted Kraschennikoff in his *Flora Ingrica*. *G. Rigens* is a very showy plant when the flowers are fully expanded. All the species are of easy culture.

1813. *Gazania*. Supposed to have been so called from γαζαί, riches, in allusion to the splendour of the flowers.

1814. *Cryptostemma*. From κρυπτος, concealed, and στεμμα, a crown; the scaly crown of the grains being involved in wool. Tender annuals, natives of the Cape of Good Hope.

1815. *Arctotheca*. See *Arctotis*, from which this has been divided.

1816. *Sphenogyne*. So called from σπιν, a wedge, and γυν, a female, in allusion to the wedge-shaped stigmas. Pretty annual flowers.

1817. *Zoega*. Named after Dr. J. Zoega, who published a *Flora Islandica* in 1775. *Leptogrea* is an abbreviation of *Lepto-centaurea*, small centaurea.

1818. *Leuzea*. Divided by M. Decandolle, from *Centaurea*, from which it differs in not having the outer florets barren, nor the pappus with simple hair, nor the insertion of the fruit oblique. He named it after his friend Deleuze.

12515 Leaves lanc. entire and sinuated, Stem erect, Flowers stalked

12516 Leaves lanc. spatulate and pinnatifid entire white with down beneath, Pedunc. 1-headed terminal

12517 Stem shrubby decumbent, Leaves spatulate-lanceolate downy beneath, Ray same color as disk

12518 Leaves pinnatifid hairy above downy beneath: segm. oval-lanc. Scape 1-headed, Stem decumbent

12519 Stem leafy decumbent 1-headed, Leaves subulate linear revolute at edge downy beneath

12520 Ligulæ undivided, Leaves pinnatifid toothed downy beneath

12521 Ligulæ 3-5-parted, Leaves lyrate downy

12522 Ligulæ 3-5-parted, Leaves runcinate toothed downy beneath

12523 The only species

12524 Smooth, Lvs. bipinnatifid or pinnatifid linear-filiform, Lvs. of pappus white

12525 Smooth, Lvs. pinnatifid linear filiform, Outer leaflets of invol. subulate

12526 Leaves bipinnatifid or pinnatifid linear filiform smooth, Scales of invol. scarious blunt shining

12527 Leaves bitripinnatifid and invol. downy

12528 Leaves pinnatifid smoothish: segm. 2-3-toothed, Teeth piliferous, Outer scales of invol. lanceolate

12529 Leaves flat smooth cut pinnatifid at end, Outer lvs. of invol. scarious at end, Pappus obsolete

12530 Leaves fleshy linear pinnatifid and bipinnatifid, Pappus much shorter than the florets of disk

12531 The radical and lower cauline leaves pinnatifid

12532 Leaves tomentose: root ones lanceolate; stem ones pinnatifid, Stem simple

12533 Flower very large

§ 1. *CYANUS*. *Involucrum ciliated, unarmed.*

* *Involucrum with feathery setæ.*

12534 Inv. recurved-feathery, Leaves oblong undivided scabrous mucronate serrulated

12535 Inv. recurved-feathery top-shaped, Leaves oblong undivided scabrous mucronate serrulated, Stem simple

12536 Inv. recurved feathery, Leaves mucronate-serrated: lower stem ones sinuate pinnatifid

12537 Inv. recurv. feathery, Lvs. egg-shap. undivid. scabr. gross. tooth. : upp. ones and those of branches undivid.

12538 Inv. recurved feathery, Leaves lanceolate sometimes toothed downy

12539 Inv. recurved feathery, Head without a neutral ray, Leaves hairy lanceolate remotely toothed

12540 Inv. recurved feathery, Leaves ovate lanceolate toothed at base nerved downy, Corollas fuscous

12541 Inv. recurved feathery pubescent, Leaves linear-lanceolate quite entire scabrous

12542 Inv. erect feathery, Lower lvs. lanc. attenuat. into the petiole serrul.; caul. ov.-obl. downy on each side

12543 Inv. recurved feathery pubesc. Head without a neutral ray, Lvs. lin. quite entire, Stem somew. shrubby

** *Involucrum with ciliated appendages.*

12544 Scales of the invol. ovate ciliated with capillary teeth, Lower leaves angular lyrate: upper ones ovate

12545 Innermost invol. scales scarious, Root lvs. obsolete pinnatif. : lower stem ones somew. tooth. at the base; upper ones undivided quite entire

12546 Inv. serrated with white ciliae, Leaves decurrent deeply pinnatifid, Pinnæ generally two

12547 Inv. serrated, Leaves smoothish lanceolate quite entire decurrent, Stem simple

12548 Inv. ciliated variegated, Leaves sessile linear downy, Stem 1-headed

12549 Scales of the involucre serrated, Leaves linear entire: the overmost toothed

12550 Inv. ciliated egg-shaped, Scales flat close-pressed: Lower lvs. bipinnatif. : upper pinnatif. Stem panicled

12551 Inv. ciliated, Root lvs. undivided and pinnatifid smooth. Stem lvs. downy pinnatifid, Branches spinous

and *Miscellaneous Particulars.*

1819. *Centaurea*. It is said, that with this plant, the *Centaurea* Chiron cured the wound in his foot made by the arrow of Hercules. Crupina is from the Dutch verb *kruppen*, which signifies to creep; because the dark multifid pappus resembles the legs of a creeping insect.

Phrygia signifies dry $\phi\upsilon\gamma\iota\alpha$, in allusion to its calyx.

Jacea is said to have been so named from *jaccere*, to lie down, on account of its prostrate habit.

Calcitrapa, the Latin of a caltrop, or iron ball covered with stiff spines, formerly used in warfare to impede the operations of cavalry. Its calyx is very like one of these instruments.

Centaurea Crocodilium is so named, because the spines of the calyx have been fancifully likened to the claws of a Crocodile.

Verutum, the name of another species, is the Latin of a short javelin used by the Roman foot-soldiers. The spines on its calyx resemble a small dart.

C. nigra is a harsh stubborn weed in meadows and permanent pastures, seldom touched by cattle either green or in hay, and with difficulty extirpated. *C. cyanus*, *Bluet*, Fr., *Kornblume*, Ger., and *Ciano*, Ital., is a common weed in corn fields, on gravelly soils, throughout Europe, and also a popular border annual. The expressed juice of the natural florets makes a good ink; it also stains linen of a beautiful blue, but the color is not permanent. *C. benedicta* was so called from its being supposed to possess extraordinary medical powers; it was

History, Use, Propagation, Culture,

said not only to destroy worms and cure fevers, but also the plague, and the most putrid and stubborn ulcers and cancers. At present it is in no estimation whatever.

It has by some botanists been thought advisable to separate this genus into several others; but the differences upon which the separation has been made depend upon variations in the form of the involucre,

- 12552 Invol. ciliated, Leaves downy very white all compound : lowest bipinnatifid ; highest pinnate-laciniate
 12553 Invol. ciliated, Leaves somewhat downy cinerous : lower ones pinnate-laciniate ; upper ones simple
 12554 Invol. ciliated, Lvs. downy undern. Root lvs. bipinnatifid : segm. lanceolate acute, Stem-leaves pinnatifid
 12555 Invol. serrated, Leaves downy : root ones pinnated ; upper 1-eared
 12556 Invol. ciliat. smooth, Lvs. pinnatif. scabr. Segm. obl. lanc. acute : highest root ones sometimes cut at base
 12557 Invol. ciliated sphacelate, Scales spreading, Leaves obl. lanc. entire villous downy : cauline decurrent
 12558 Invol. scales roundish egg-shaped ciliated, Leaves oblong lanc. undivided very scabrous acute serrated
 12559 Invol. scales ovate lanceolate serrate-ciliated, Leaves bipinnatifid, Segments lanceolate
 12560 Invol. egg-shaped smooth, Scales somew. scar. at tip, Lvs greenish decurr. undivided : radical ones lyrate
 12561 Inv. scales scar. at tip serr. Lvs. scab. at edge : root ones obl. tooth. ; stem ones lanc. somew. decurr. quite ent.
 12562 Scales of the involucre ciliated ovate pubescent, Leaves pinnatifid roughish : the segm. lanceolate acute
 12563 Invol. ciliated nearly globular, Leaves deeply pinnatifid, Segments linear
 12564 Invol. ciliated ovate roundish beautifully spotted, Leaves slender bipinnatifid, Stem a little paniced
 12565 Invol. ciliated oblong, Leaves pinnatifid linear quite entire
 12566 Invol. serrated, Leaves oblong serrated decurrent and undivided [branched divaricated
 12567 Invol. ciliat. Scales ovate-lanc. spread. at tip, Lower lvs. bipinnatif. lanc. lin. : upper ones pinnatifid, Stem
 12568 Invol. ciliated, Leaves lanceolate serrated : lowest tooth elongated so as to appear like a stipule
 12569 Invol. ciliated, Leaves downy pinnatifid, Segments obtuse egg-shaped quite entire : outer ones largest
 12570 Invol. ciliated, Leaves scabrous : underneath pinnatifid, Segments lanceolate sometimes toothed
 12571 Invol. scarios, Scales ovate lanceolate serrated ciliated, Leaves scabrous beneath : radical bipinnatifid

§ 2. CALCITRAPA. *Involucrum ciliated with spines.*

- * *Spines simple.*
 12572 Invol. erect feathery, Head without a neutral ray, Lower lvs. pinnatif. : upper ones lin. All quite ent. Stem [paniced
 12573 Invol. ciliate-spinous egg-shaped, Scales reflexed at tip, Lvs. hoary : root ones lyrate ; stem ones linear
 12574 Invol. ciliate-spinous at tip, Spines of lower scales reflex. Lvs. pinnat. Pinnæ lin. obt. Root leaves bipinnat.
 12575 Invol. ciliate-spinous, Leaves lyrate-pinnated generally entire : terminal lobe large toothed
 12576 Invol. ciliate-spinous, Stem-leaves pinnatifid : root ones bipinnatifid, Segments lanceolate
 12577 Invol. ciliate-spinous, Stem-leaves pinnated : root leaves bipinnated, Pinnæ linear-filiform
 12578 Invol. ciliate-spin. at tip, Stem-lvs. pinnatif. lin. lanc. : root ones bipinnatif. Segm. lanc. terminal 1-toothed
 12579 Invol. ciliate fringed with straight rigid white bristles, Lvs. obl. a little toothed, Head yell. without a ray
 12580 Invol. simply spinous, Spines spreading, Florets equal, Leaves hairy : lower ones pinnatifid
 12581 Invol. bristly spinous, Leaves lanceolate petioled toothed near the base
 12582 Invol. scarcely spinous somewhat awned rayed, Leaves pinnatifid
 12583 Invol. ciliated spinous, Stem-leaves pinnated quite entire. root-leaves bipinnatifid
 12584 Invol. ciliate spinous at the tip, Leaves hoary pinnatifid quite entire : upper ones linear-lanceolate
 12585 Invol. ciliate subsipiny, Leaves oblong downy sessile somewhat toothed ; narrowed at base deeply toothed

** *Spines palmate.*

- 12586 Invol. palm.-spin. Spines reflex. Lvs. obl. smooth, embracing the stem $\frac{1}{2}$ decurr. repand tooth. Teeth prickly
 12587 Invol. palm.-spinous, Spines reflex. Lvs. obov. somew. tooth. stalked : floral somew. decurr. micro.-toothed
 12588 Inv. palm.-spin. Spines reflex. Lvs. obl. hoary embrac. stem $\frac{1}{2}$ -decurr. tooth. cut at base, Teeth rather prickly
 12589 Invol. palm. spinous, Lvs. decurr. not prickly : root ones pinnatifid ; terminal lobe very large
 12590 Inv. palm. spin. Spines reflex. larger than calyx, Lvs. hoary obl. sess. decurr. pinnatifid, Teeth not prickly
 12591 Invol. palmate spinous, Lvs. ovate-lanc. petioled toothed
 12592 Invol. palmate spinous solitary sess. Lvs. lanc. a little embracing the stem pinnatifid toothed
 12593 Invol. palmate spinous, Stem lvs. lanc. toothed decurrent : root lvs. lyrate obtuse
 12594 Invol. palmate spinous, Spines 3 or 5, Lvs. lanc. sessile toothed
 12595 Invol. ciliated surrounded by a whorl of long lvs. Lvs. lyrate toothed obtuse
 12596 Invol. palmate spinous, Lvs. embracing the stem runcinate pinnatifid quite entire : toothed root ones lyrate
 12597 Invol. doubly spinous woolly bracteated, Leaves half decurrent toothed spinous
 12598 Invol. palm. spinous term. solitary, Spines straight, Lvs. lanc. decurr. not prickly : root ones lyrate
 12599 Invol. palm. spin. term. ones clustered sess. Spines straight, Lvs. lanc. scabrous decurr. not prickly : lower stem ones a little toothed ; root ones situated
 12600 Invol. palm. spinous solitary subsessile, Spines straight, Lvs. lanc. scabrous toothed decurrent
 12601 Inv. palm. spin. Spines spread. Lvs. scabr. : stem lvs. lanc. a little embrac. stem finely toothed ; root ones lyrate
 12602 Invol. palm. spinous solit. Spines straight : inner scales scarios at the tip, Lvs. downy lanc. decurr. : lower ones finely toothed pinnatifid at the base
 12603 Invol. palmate spinous terminal sess. glomerated, Leaves petioled pinnatifid cut-toothed

*** *Appendages of involucre spinous-pinnate.*

- 12604 Invol. doubly spinous woolly, Lvs. half decurrent entire and situated, Stem proliferous
 12605 Invol. doubly spinous sess. Lvs. pinnatifid toothed, Stem divaricated spreading hairy
 12606 Invol. somewhat doubly serrated, Lvs. embracing the stem lanc. undivided serrated [entire decurr.
 12607 Inv. palm. spin. : mid. spine very long ; lat. ones short, Root-lvs. sinuate-pinnatif. Stem ones lanc. quite
 12608 Invol. doubly spinous somewhat woolly, Lvs. sess. lanc. entire and toothed, Stem proliferous

and Miscellaneous Particulars.

unconnected with differences of organization ; they are therefore not adopted here. The tribe of Centauree of M. Cassini is not distinguished from Carduineæ by any very important characters. The greater part of the species are natives of Europe and Asia, several of Africa, a very few of America, and none of the northern parts of the world.

History, Use, Propagation, Culture,

C. moschata is a handsome border annual, of which there is a white-flowered variety. C. Centaureum, montana, splendens, and glastifolia, are among the most ornamental of the perennials.

1820. Galactites. A plant formerly included in Centaurea, and named on account of the milky veins of its leaves (γάλα, milk).

1821. Wedelia. Named after George Wolfgang Wedel, a German, born in 1625, died in 1721. He was professor at Jena, and published many learned dissertations upon the plants of the ancients. There was also a John Adolphus Wedel, professor in the same university.

§ 3. *CROCODYLIUM*. *Involucrum not ciliated, but spiny at end.*

- 12609 Invol. globul. smth. Spine very small weak a little reflex. Lvs. lanc. serrat. : root ones lyrate, Stem divaricat.
- 12610 Invol. simply spinous villous, Lower lvs. lyrate toothed : upper ones lanc. Peduncles very long
- 12611 Invol. scarious simply spinous, Lvs. pinnatifid quite entire terminal : segm. larger toothed

§ 4. *RHAPONTICUM*. *Leaves of involucrum with a round scarious appendage, which is often lacerated.*

- 12612 Invol. scales lacerated, Lvs. ovate-obl. finely toothed tomentose [ones lyrate
- 12613 Invol. conical hard, Scales ending in a patulous point, Lvs. somew. tomentose decurr. undivided : root
- 12614 Inv. egg-shap. Scales mucronat. Lower lvs. bipinnatif. lin. : upper ones pinnat. Pinnae lin. sometimes toothed
- 12615 Invol. ciliated, Scales acum. somew. thorny, Lvs. obl. pinnatif. Florets of the ray longer than those of disk
- 12616 Invol. scarious, Scales dilated cut, Lvs. linear-lanc. : radical cut
- 12617 Scales of invol. scarious torn : lower ones pinnatifid, Lvs. lin. lanc. : the lower ones broader and toothed
- 12618 Invol. scales roundish quite ent. Lvs. obl. smth. : root ones serrat. Stem ones sometimes slightly cut at base
- 12619 Invol. scales entire mucronated, Lvs. pinnate toothed : stem ones linear toothed at the base
- 12620 Stems decumbent, Lvs. lanc. quite entire
- 12621 Invol. cylindrical, Scales mucronated, Lvs. pinnated, Pinnae lin. mucronated quite entire
- 12622 Invol. scales egg-shaped obtuse ciliated, Lvs. downy on both sides pinnatif. and undivided, Stem declining
- 12623 Leaves undivided quite entire decurrent
- 12624 Invol. scales pectinate ciliated, Lvs. deeply pinnatifid, Segm. linear lanceolate [the stem decurrent
- 12625 Invol. conical, Scales quite ent. Lvs. coriaceous reticularly veined : root ones lyrate ; stem ones embracing
- 12626 Leaves lanc. toothed somewhat petioled, Peduncles filiform leafless

§ 5. *Leaves of involucrum neither ciliated, nor spiny, nor with a scarious appendage.*

- 12627 Invol. roundish smooth, Scales egg-shaped, Lvs. lyrate toothed
- 12628 Invol. scales egg-shaped, Lvs. pinnated, Leaflets decurrent serrated
- 12629 Invol. scales egg-shap. obt. Lvs. pinnat. smooth, Leaf. cartilagin. sharply serrat. termin. one obl. egg-shaped
- 12630 Invol. round. smooth, Lower lvs. broad somew. spatul. tooth. : upp. ones lyr. at base, Head yell. sweet scent.
- 12631 Invol. scales linear awl-shaped, Leaves pinnated serrated
- 12632 Invol. scales mucronate, Leaves somewhat decurrent lyrate toothed
- 12633 Invol. pubescent, Scales roundish obtuse, Leaves deeply pinnatifid : lowest segments toothed
- 12634 Invol. scales egg-shaped obtuse, Leaves pinnated smooth quite entire odd one serrated

- 12635 Invol. bristly spinous, Leaves decurrent sinuated spinous downy underneath.

NECESSARIA.

- 12636 Leaves lanceolate acuminate serrated with a large tooth on each side at the base
- 12637 Leaves ovate-lanceolate, Invol. urecolate squarrose, Rays imbricated
- 12638 Stem herbaceous, Leaves rhomboid narrowed at base connate

- 12639 Leaves stalked roundish-ovate narrowed at base : floral subordinate, Pedunc. terminal dichotomous
- 12640 Leaves stalked oblong ovate ciliated, Pedunc. terminal aggregate

- 12641 Stem winged, Heads pale-yellow small

- 12642 Radical and cauline leaves pinnatifid, Stem hirsute
- 12643 Cauline leaves sinuate pinnatifid : radical ternate sinuate multifid
- 12644 Leaves alternate ovate serrated scabrous : radical cordate
- 12645 Leaves opposite deltoid stalked perfoliate, Stem square smooth
- 12646 Lvs. opp. conn. unequally toothed, Stem smooth square, Four outer sc. of invol. longer than the inner
- 12647 Leaves sessile stalked, Stem round scabrous
- 12648 Leaves opposite or alternate sessile oblong hairy : lower serrate, Stem round hispid
- 12649 Stems 6-angled, Leaves ternate ovate toothed, Panicle trichotomous
- 12650 Stems round, Leaves ternate somewhat toothletted, Panicle dichotomous
- 12651 Stems round, Leaves about 4 toothletted, Panicle dichotomous

and Miscellaneous Particulars.

1822. *Milleria*. So named by Linnaeus, after Philip Miller, F. R. S., the well known author of the Gardener's Dictionary, and considered the first botanical gardener of his time. He was born in 1692, and died in 1762.

1823. *Baltimora*. This plant grows in the neighbourhood of Baltimore.

1824. *Siphium*. D'Herbilot asserts, that *silphi* or *serpi*, was a name given by the natives of Africa to the plant which produced the *laser* of the Romans, a substance held in great esteem among them for its flavor and its medicinal properties. All the species are tall herbaceous plants with bright yellow flowers, and are very proper ornaments for a shrubbery.

History, Use, Propagation, Culture,

1825. *Trix'is*. From τρις, three, on account of its triangular capsule with three cells.
 1826. *Polymnia*. Polymnia was the name of one of the Muses. Why it has been applied to this plant is not very obvious. A coarse broad-leaved weedy plant.
 1827. *Chryso'gonum*. From χρυσος, gold, and γων, a knee. The bright yellow flowers are usually produced in the bends of the stems.
 1828. *Metampodium*. One of the Greek names of black hellebore, with which the modern plant has no relation. The plant of the ancients was probably named from the blackness of the roots, (μελας, black, and πους, a foot).
 1829. *Chaptalia*. Dedicated by Ventenat to the famous French chemist, M. Chaptal. A pretty little North American herbaceous plant.
 1830. *Calendula*. So named because it may be found in flower during the *Calends* of each month, or, which is the same thing, during every month in the year. C. pluviãlis has been named from its flowers closing at the approach of rain.

- 12652 Herbaceous downy, Leaves sinuate pinnatifid toothed: cauline amplexicaul.
- 12653 Leaves toothletted acuminate: lower pinnatifid; upper 3-lobed or entire
- 12654 Leaves 3-lobed acute running down the petiole: lobes angular sinuated
- 12655 Leaves opposite sessile oblong lanceolate somewhat toothed, Invol. 5-parted, Florets all female
- 12656 Leafstalks longer than leaves
- 12657 Stem erect, Leaves somewhat linear 1-toothed on each side
- 12658 Stem erect, Leaves lyrate-toothed sessile
- 12659 Leaves ovate-oblong entire silvery beneath, Scape naked 1-headed, Head nodding
- 12660 Pericarps cymbiform muricated incurved: outer lanceolate-subulate muricated at back
- 12661 Pericarps cymbiform muricated incurved: outer ovate with a membranous edge toothed crested at back
- 12662 Pericarps cymbiform incurved muricated: outer 5 ovate-lanceolate membranous toothed at edge
- 12663 Pericarps cymbiform all incurved muricated
- 12664 Pericarps urceolate obovate smooth, Involucre somewhat muricated
- 12665 Pericarps cymbiform smooth: outer subulate erect somewhat muricated. Lvs. obl. spatul. downy on each side
- 12666 Leaves narrow lanceolate sinuate toothletted, Stem leafy, Peduncles filiform
- 12667 Leaves oblong lanceolate blunt toothed, Stem leafy, Peduncles thickened at end
- 12668 Leaves lanceolate sinuate toothed, Stem nearly naked
- 12669 Leaves linear nearly entire, Stem nearly naked
- 12670 Leaves linear somewhat toothletted muricate dotted beneath, Pericarps orbicular, Stem suffruticose
- 12671 Leaves cuneate cut toothed glabrous, Invol. downy ciliated, Stem shrubby weak
- 12672 Leaves opposite linear entire somewhat fleshy smooth
- 12673 Leaves obovate somewhat toothed, Stem fruticose decumbent
- 12674 Leaves obovate sublyrate roughish, Stem suffruticose erect
- 12675 Lvs. obl. toothed scabrous, Invol. in fruit cernuous, Pericarps nearly orbicular, Stem fruticose panicled
- 12676 Peric. cymbif. incurv. muricat.: outer lanc. subulate muricated erect, Lvs. obl. spatul. downy on each side
- 12677 Pericarps all uniform incurved cymbiform muricated, Leaves lanceolate toothletted acute smoothish
- 12678 Leaves oblong papillose scabrous: lower toothed; upper entire, Stem shrubby
- 12679 Radiant florets fertile, Stem very short decumbent, Leaves hoary on each side ternate lyrate
- 12680 Radiant florets fertile, Leaves downy beneath ovate entire or lyrate-toothed, Scape furrowed 1-headed
- 12681 Radiant florets fertile, Leaves downy beneath wavy-toothed ovate or lyrate, Scapes 1-headed
- 12682 Leaves pinnatifid toothletted cove-lobed 3-nerved
- 12683 Radiant florets fertile, Leaves hoary pinnatifid repand somewhat toothed, Outer scales of invol. reflexed
- 12684 Radiant florets fertile, Leaves lanceolate ovate nerved toothletted amplexicaul.
- 12685 Radiant florets fertile, Leaves lanceolate linear entire downy
- 12686 Radiant florets fertile, Stem procumbent, Leaves spatulate-lanceolate repand-toothed hoary
- 12687 Radiant florets fertile, Stem procum. Leaves obl. lanc. unequally toothed hoary downy beneath 3-nerved
- 12688 Radiant florets fertile, Stem branched ascending, Leaves downy spatulate lanceolate 3-nerved pubescent
- 12689 Radiant florets fertile, Stem branched ascending, Leaves spatulate lanceolate entire 3-nerved downy
- 12690 Radiant florets fertile, Stem shrubby, Leaves hairy oblong undivided somewhat toothed
- 12691 Radiant florets fertile, Stem shrubby erect hoary, Lvs. obov. oblong vill. toothed decurr. down the petiole
- 12692 Radiant florets fertile, Stem ascend. Lvs. hairy hoary beneath: lower lyrate-toothed; upper lanc. tooth.
- 12693 Radiant florets fertile, Stem snow white, Leaves lyrate amplexicaul. downy toothed: term. lobe rhomb.
- 12694 Radiant florets fertile, Stem erect, Leaves hairy oblong toothed, Outer scales of invol. reflexed ciliated

and Miscellaneous Particulars.

C. officinalis, *Souci du jardin*, Fr., *Goldblume*, Ger., and *Furrancio*, Ital., has been a garden plant time out of mind, and used in soups and broths, both to color them, and as comforters of the heart and spirits. It had formerly many virtues ascribed to it, but is now totally out of use in this country. According to Linnaeus, the flowers are open from nine in the morning till three in the afternoon. There are double, lemon-colored, and prolific varieties. From the flowers of *Calendula officinalis* is obtained a distilled water, a kind of vinegar, and a conserve.

With this genus for his type, M. Cassini has formed a small tribe which he calls *Calenduleæ*, remarkable for a peculiar smell, very perceptible in the common pot-marygold, which is said to be confined to themselves alone. But this seems to be almost the only character by which they are distinguished from *Helianthææ*. The greater part of *Calenduleæ* are found in the country of the Cape of Good Hope, but some are found in Europe and Asia.

1831. *Arctotis*. Vaillant, who named this genus, called it *Arctotheca*, from *αρκτος*, a bear, and *θηκη*, a capsule, because its fruit is shaggy like a bear. This and some neighbouring genera have given rise to M.

History, Use, Propagation, Culture,

Cassini's tribe of Arctodeæ, which has the remarkable peculiarity of occasionally producing an ovarium with three cells. In the peculiarities of their style they approach the tribes of Echinopseæ, Carduineæ, Centaureæ, and Carlineæ. They are entirely confined to the regions of the Cape of Good Hope.

1832. *Osteospermum*. From *οσπερ*, a bone, and *σπερμ*, seed, in allusion to the hardness of the fruit.

1833. *Othonna*. Dioscorides mentions this name as being applied to various things, but especially to a plant with a leaf like rocket, but perforated with little holes, whence it was called *Othonna*, from *οθον*, linen. The plant of the ancients can have had little affinity with that of the moderns.

1834. *Hippia*. A name applied by Cordus to the common Chickweed, because it was agreeable food for

- 12695 Radiant florets fertile, Stem erect, Leaves hoary viscid oblong amplexicaul. mucronate-toothed
 12696 Radiant florets fertile, Leaves pinnatifid lyrate angular toothed downy beneath
 12697 Radiant florets fertile, Stem erect, Leaves pinnatifid scabrous downy beneath revolute at edge
 12698 Radiant florets fertile, Outer scales of invol. reflexed cuneate obl. with a broad short point somew. cobw.
 12699 Radiant florets fertile, Stem erect, Leaves pinnatifid lyrate hoary downy beneath, Invol. imbricated
 12700 Stemless, Leaves lyrate pinnatifid hoary beneath 3-nerved, Outer scales of invol. linear recurved
 12701 Radi. flor. fertile, Stem erect, Branches downy hairy, Lvs. pinnatif. downy ben. : seg. lin. lanc. angul. downy
 12702 Radiant florets fertile, Stem erect, Pedunc. hairy, Lvs pinnatif. hoary downy ben. : seg. lanc. angul. toothed
 12703 Radiant florets fertile, Stem erect, Leaves downy beneath : segm. linear subpinnatifid wavy
 12704 Radiant florets fertile, Leaves hoary downy long-stalked pinnatifid : segm. lanceolate blunt toothed

- 12705 Leaves lanceolate glabrous, Heads paniced
 12706 Leaves obovate serrate downy, Spines branched
 12707 Leaves lanceolate pinnatifid-toothed scabrous, Spines branched
 12708 Leaves lanceolate mucronate somewhat stalked smooth serrated, Branches toothletted angular
 12709 Leaves obovate serrated stalked subdecurrent
 12710 Leaves oblong toothed-angular scabrous $\frac{1}{2}$ -plexicaul. Branches furrowed
 12711 Leaves toothed pinnatifid hairy, Branches unarmed
 12712 Leaves pinnatifid smooth, Segments lanceolate unequally serrated
 12713 Leaves lanceolate scattered decurrent smooth entire, Axillæ woolly

- 12714 Leaves pinnatifid : pinne lanceolate entire decurrent
 12715 Leaves pectinate-pinnatifid downy : segm. linear toothed at the edge
 12716 Leaves pinnate filiform, Invol. hemispherical many-toothed
 12717 Leaves multifid pinnated linear, Joints of stem villous
 12718 Leaves lanceolate 1-toothed on each side in the middle or entire, Peduncles axillary, Stem divaricating
 12719 Lower leaves lanceolate entire : upper sinuate toothed
 12720 Leaves lanceolate 3-nerved entire, Stem suffruticose creeping
 12721 Leaves deeply pinnatifid glabrous : segments linear somewhat toothed, Stem herbaceous
 12722 Leaves pinnatifid very small, Peduncles long slender axillary 1-headed, Ray longer than disk
 12723 Leaves lanceolate entire somewhat fleshy, Stem erect
 12724 Leaves oblong toothletted smooth narrowed at base amplexicaul. Heads paniced
 12725 Radical leaves ovate angular toothed : cauline lanceolate entire
 12726 Leaves entire : radical lanceolate ; cauline lanceolate subcordate $\frac{1}{2}$ -plexicaul. Stem erect
 12727 Leaves entire : radical cordate ; cauline ovato-lanceol. cordate at base amplexicaul. Stem flaccid filiform
 12728 Leaves ovate somewhat toothed, Peduncles 1-headed very long
 12729 Root tuberous, Leaves amplexicaul. Peduncles 1-headed
 12730 Leaves lanceolate smooth amplexicaul. Heads paniced
 12731 Stem dichotomous imbricated : leaflets acrose, Peduncle very long solitary in the divarications
 12732 Leaves filiform fleshy, Stem shrubby
 12733 Leaves oblong entire, Stem arborescent fleshy with woolly scars
 12734 Fleshy naked smooth a span high, Leaves fascicled obovate sessile, Peduncle 1-headed

- 12735 Shrubby villous, Leaves pinnatifid, Heads corymbose
 12736 Hispid erect, Leaves ovate serrated 5-nerved, Racemes terminal

- 12737 Leaves pinnated : leaflets linear many-times lobed acute, Pericarps cuneiform hairy

12738 The only species

- 12739 Leaves entire and divided, Heads corymbose
 12740 Leaves linear silky

- 12741 Stem erect prolifer, at summit, Lvs. lanc. downy acute, Fls. capitate in the axils of branches and terminal
 12742 Stem erect dichotom. Lvs. lin. acum. downy, Fls. crowded axill. and term. Clust. much shorter than leaves
 12743 Stem erect subdichotomous, Leaves lanceolate spatulate downy, Flowers clustered axillary and terminal

and Miscellaneous Particulars.

horses, *ίππος*, a horse ; and given to this plant by Linnæus for no reason whatever. Little plants resembling Tansy.

1835. *Soliva*. Named by the authors of the Flora Peruviana, after Salvator Soliva, a Spanish physician and botanist.

1836. *Paiodia*. From *Παῖς*, a drop of dew, in allusion to the dew-bespangled foliage of the plants.

1837. *Eriocephalus*. From *εἶωρ*, wool, and *κεφαλή*, a head, on account of the woolly grains collected in terminal heads.

1838. *Filago*. All the parts of these plants are covered with delicate threads or *fila*.

History, Use, Propagation, Culture,

1839. *Micropus*. From *μικρος*, small, and *πους*, a foot; so called with reference to *Leontopodium* (which see), than which it is smaller, but which it resembles in its velvety silvery leaves.

1840. *Parthenium*. The Greek name of the *Matricaria*, which see. The indecent derivation of the word *Hysteriophorus*, is sufficiently explained by Vaillant. (*Mem. Acad. Sciences, anno 1720.*)

1841. *Iva*. This name, according to Fuchsius, is a mere abbreviation of *abiga*; see *Ajuga*. It has been applied by Linnæus to these plants because their smell resembles that of the ancient *Iva*.

1842. *Acicai'pha*. From *ακcis*, a point, and *αγγελος*, a palea, because that appendage is spiny.

1843. *Elephantopus*. It is said that some resemblance may be found between the radical leaves of this plant and an elephant's foot (*ἑλεφαντος*, an elephant, and *πους*, a foot).

1844. *Edera*. After George Eder, a Dane, professor of botany at Copenhagen, and the founder of the extensive *Floræ Danicæ*.

1845. *Flacria*. From *flavus*, yellow, because the plants are used in Chili for dyeing of that color.

- 12744 Stem erect subtrichotomous, Lvs. lin. lanc. appressed downy, Flowers clustered axillary and terminal
 12745 Stem erect branch. Branch. sprdg. Lvs. lanc. acute cottony, Fls. conic. clust. lat. term. Clust. longer than lvs.
 12746 Stem erect panicled, Leaves oblong lanceolate woolly, Heads clustered lateral and terminal downy
 12747 Stem erect branched, Lvs. lanc. cord. at base amplexicaul. woolly, Heads clust. lat. and terminal downy
 12748 Leaves nearly glabrous above, Spike longer more interrupted
 12749 Stem herbaceous quite simple, Leaves oblong spatulate downy beneath hoary, Heads clustered
 12750 Stem erect branched, Lvs. obov. spatulate downy beneath, Heads axillary and terminal clustered spiked
 12751 Stem decumb. branch. only from base, Flower. stems erect, Fls. solit. or racem. Lvs. lin. downy on both sides
 12752 Stem quite simple nearly erect about 3-flowered, Leaves linear acute downy, Runners procumbent
 12753 Stem branched erect, Leaves linear 3-nerved acute very narrow at base downy beneath
 12754 Stem simple, Leaves linear 3-nerved acuminate silky beneath, Heads terminal clustered [than lvs.]
 12755 Stem very much branch. diffuse woolly, Lvs. lin. lanc. downy, Fls. in term. crowded clust. which are shorter
 12756 Stem simple nearly erect downy, Fls. axillary forming a distant leafy spike Leaves linear lanc. downy

- 12757 Leaves opposite obovate cuneate
 12758 Leaves alternate lanceolate, Heads woolly

- 12759 Leaves bipinnatifid
 12760 Leaves undivided oblong toothed

- 12761 Leaves lanceolate-ovate, Bractes lanceolate and petioles downy
 12762 Leaves lanceolate dotted scabrous deeply serrated, Stem shrubby

- 12763 Leaves spatulate

SEGREGATA.

- 12764 Leaves scabrous : radical narrowed at base ; cauline lanceolate, Stem branched strigose
 12765 Radical and cauline leaves oblong narrowed at base somewhat hairy, Stem simple hairy
 12766 Leaves ovate downy

- 12767 Leaves lanceolate serrated reflexed

- 12768 Leaves somewhat stalked lanceolate 3-nerved mucronate-serrate

- 12769 Leaves mucronate subulate reflexed, Stem erect
 12770 Leaves linear subulate oblique, Spike cylindrical

- 12771 The only species

- 12772 Leaves lanceolate-linear smooth glandular beneath, Corymbs decomposed
 12773 Panicle decomposed, Leaves lanceolate decurrent with their under surface and the branches woolly
 12774 Corymb nearly sessile, Leaves small linear white beneath

- 12775 Leaves lanceolate serrate decurrent glabrous, Peduncles winged, Wings of stem and peduncles serrated
 12776 Leaves decurrent ovate serrated, Peduncles round
 12777 Leaves obovate serrated hairy decurrent, Peduncles winged, Wings of stem and peduncles serrated

and Miscellaneous Particulars.

1846. *Stabe*. The name under which Theophrastus and Pliny designate a plant of a rough and spiny habit. This is the character of the modern plant, which is very dissimilar to that of the ancients, which is believed to have been *Poterium spinosum*.

1847. *Naumburgia*. Named by Willdenow without explanation; but we presume in honor of John Samuel Naumburg, author of a Dissertation upon *Veronica Chamædrys*, &c., published at Erfurt in 1792.

1848. *Cassinia*. Named after M. Henri Cassini, a celebrated French botanist, who has devoted much attention to the study of the very difficult tribe of plants to which this belongs, and with singular success. But his observations are scattered through so many different works, that it is almost hopeless to acquire a knowledge of their actual extent. Neat New Holland shrubs with white or yellow flowers.

1849. *Sphaeranthus*. From *σφαῖρα*, a globe, and *ἄνθος*, a flower, on account of the globular form of the heads of flowers.

History, Use, Propagation, Culture,

1850. *Echinops*. From *εχινος*, a hedgehog, and *οψις*, resemblance; because of the bristly round heads of flowers protected in every direction by stiff spines. The woolly leaves of *Echinops strigosus* are employed in Spain as tinder. Upon this genus M. Cassini has founded his tribe of *Echinopseæ*, which it must be confessed is entirely distinct from any other, and extremely remarkable on account of its very singular aberrations from the ordinary structure of *Compositæ*.

1851. *Rolandra*. After Daniel Rolander, a pupil of Linnæus, who visited Surinam. Nothing appeared from him except an account of *Dolioscarpus* in the seventeenth volume of the Transactions of the Academy of Sciences of Stockholm.

- 12778 Leaves pinnatifid downy above woolly beneath, Stem branched
 12779 Heads scattered with long spines
 12780 Head globose, Leaves pinnatifid smooth above
 12781 Heads fascicled, Lateral invol. sterile, Leaves strigose on the upper side
 12782 Stem branched woolly, Leaves subbipinnate: segments narrow smooth above, Head subsessile
 12783 Leaves rugose squarrose pinnatifid smooth above glaucous with down beneath
 12784 Stem simple upright 1-headed, Leaves eroded pinnatifid spiny-toothed smooth above downy beneath

12785 The only species

12786 Heads corymbose numerous

12787 Leaves long and spiny

12788 The only species

and Miscellaneous Particulars.

1852. *Brotera*. Named after Felix Avelhar Brotero, a Portuguese botanist, professor at Coimbra; author of a useful *Flora Lusitânica*.

1853. *Gundelia*. Named after Andrew Gundelsheimer, a German botanist, who accompanied Tournefort in his journey into the Levant in 1709.

1854. *Euzenia*. A name unexplained by its author. Apparently derived from *uzives*, hospitable, but in what sense we do not perceive.

CLASS XX. — GYNANDRIA.

The singular plants which constitute this class are distinguished from all others by the anomalous structure of their flowers. These do not, as is usually the case, contain a certain number of stamens surrounding a central ovarium or style, but on the contrary are furnished with a solitary fleshy undivided process, round which the sepals radiate, and which supplies the place of stamens and style. The nature of this process has been variously explained: the modern opinion is that it is formed by the accretion of the stamens and style into a single mass, and this opinion seems to be confirmed by analysis and analogy. Omitting, therefore, a notice of such theories respecting its nature as are opposed to that which is now received as the most correct, it will suffice to explain a little in detail, the opinion which is adopted in this work. The central process, called the columna or style, is understood to be formed by the filaments of three stamens surrounding a style, and by mutual accretion firmly united with it and with each other into a solid mass. Of these three stamens, it most frequently happens that the *two lateral* are sterile, and not furnished with even the vestige of an anther; and that their presence is not indicated by more than two irregular excrescences, as in *Orchis*, or by the same number of small appendages, as in *Satyrion*, or by two horn-like or tooth-like processes, present in several of the genera with waxy pollen-masses: it even happens, and not infrequently, that no vestige whatever of them remains. But in *Cypripedium* both are fertile and bear perfect anthers, while the central stamen is barren and foliaceous. When the lateral stamens are, as above stated, abortive, which is the most common form of the columna, the central stamen bears at its upper extremity an anther, which is either moveable or fixed firmly in its place. The pollen which this contains, assumes three very distinct appearances in different tribes. It is either granular, dividing into many separable small pieces, as in *Orchis*; or powdery, consisting of an infinite number of granules, as in *Spiranthes*; or waxy, when it consists of a few large concrete masses, as in *Epidendrum*. The stigma is most frequently concave, and placed nearly under the anther, but in such a manner, that there is no contact between it and the pollen. In what way, therefore, fecundation can take place among truly Gynandrous plants, is one of those mysterious contrivances of nature which has not yet been explained. It is generally believed to take place by absorption in some undiscovered manner, before the flowers expand; but it is extremely difficult to understand how this can occur in many genera. The foregoing remarks apply only to the tribe of plants called Orchideous. The few genera attached to the latter part of the class are Gynandrous by the cohesion indeed of their stamens and style, but in a much more obvious manner.

Gynandrous plants are among the most interesting of the vegetable productions of the globe, whether we consider the vivacity of their colors, or the singularity of their organization, or the grotesque appearance of their tortuous roots, or the delicious perfume of their flowers. They are distributed in abundance over all the earth. In Europe and the temperate parts of the world, they are principally found in meadows and pastures among grass; but in tropical regions they often constitute the chief beauty of the forest, occupying the forked branches of living trees, or the prostrate trunks of fallen timber, over which, in company with ferns and parasitical Aroidæ, they climb and trail in every direction, until they adorn the one with bright hues and rich odours foreign to their nature, and render the others more beautiful in death, than in the full vigour of their existence.

Order 1. MONANDRIA.

Stamen 1.

§ 1. *Anther terminal, erect. Pollen granular, cohering by an elastic thread.*

1855. *Disa*. Flowers ringent: helmet with a spur or bag at the base. Inner sepals united to the column. Lip without a spur.

1856. *Satyrion*. Flower ringent: five anterior sepals united at base. Lip behind, fornicate with two spurs or bags at the base. Anther resupinate. Stigma 2-lipped.

1857. *Platanthera*. Flower vaulted. Lip entire with a spur. Cells of the anther widely divided at their base by the broad interposed stigma. Glands of pollen masses naked. Lips of stigma absent.

1858. *Cynalecia*. Cor. ringent. Lip spurred at the base beneath. Glands of the stalks of the pollen-mass naked, approximate.

1859. *Orchis*. Cor. ringent. Lip spurred on the underside at the base. Glands of the stalks of the pollen-mass (1-2) contained in one common little pouch.

1860. *Nigritella*. Ovary straight. Flower spreading. Lip posterior, entire, with a scrotiform spur. Glands of pollen-masses distinct, and enclosed in a single 2-celled pouch.

1861. *Habenaria*. Cor. ringent. Lip spurred on the upper side at the base beneath. Glands of the stalk of the pollen-mass naked, distinct, with the cells of the footstalks adnate or separated.

1862. *Bartholina*. Flower ringent: inner sepals united below with the lip. Lip spurred beneath at the base. Stalks of the pollen-masses long; cells united to the column: glands distinct, half covered by the exterior lobe.

1863. *Glossula*. Sepals conniving in a galea: the upper without a spur. Lip anterior, spurred, 3-parted, with an inflated spur. Pollen-masses 2, 2-parted, with 2 glands enclosed in distinct pouches.

1864. *Anacamptis*. The flower of *Orchis*, from which it differs in having the gland of the pollen-masses single, with inflexed edges, and enclosed in a pouch.

1865. *Accras*. Flower ringent. Lip without a spur. Glands of the pollen-masses included in a common pouch.

1866. *Ophrys*. Flower somewhat spreading. Lip without a spur. Glands of the pollen-masses inclosed in two distinct pouches.

1867. *Chamorchis*. Ovary reclinate at end. Flower galeate. Lip without a spur, undivided. Glands of the pollen-masses naked. Upper lip of stigma divided. Anther of *Orchis*.

1868. *Hermidium*. Flower somewhat spreading. Lip without a spur. Glands of the pollen-masses naked, distinct.

1869. *Serapias*. Flower ringent. Lip without a spur. Column sharp-pointed. Pollen-masses attached to a single gland inclosed in one pouch.

§ 2. *Anther parallel with stigma. Pollen powdery.*

1870. *Goodyera*. Cor. ringent, with the 2 exterior or lateral segments of the perianth placed beneath the lip, which is gibbous at the base and undivided at the extremity. Column free. Pollen angular.

1871. *Diris*. Flower irregular. Two outer linear sepals placed beneath the trifid lip: the inner clawed and spreading. Column with the lateral lobes petaloid. Pollen farinaceous.

1872. *Ponthicva*. Flower irregular. Lip behind, with the inner sepals inserted in the column. Pollen farinaceous.

1873. *Neottia*. Flowers connivent. Lip sessile, 2-lobed, with no calli. Anther terminal, sessile. Stigma 2-lipped perversus; the front lip thickened.

1874. *Spiranthes*. Spike spiral. Ovary oblique at the end. Sepals connivent. Lip clawed, parallel with columna, with 2 calli at the base, entire. Anther terminal stalked. Stigma flat, cuspidate, membranous, finally split.

1875. *Stenorhynchus*. Like the last; but the lip adheres to the columna by means of the margins of its lateral lobes; it has no callosities. Stigma corneous, always entire.

1876. *Listera*. Flowers connivent. Lip 2-lobed, sessile, with no calli. Anther intramarginal, half covered over by the hooded clinandrium. Stigma closed, nearly flat, with a strong transverse furrow.

§ 3. *Anther terminal, persistent. Pollen powdery.*

1877. *Archusa*. Lip united at base with the columna, at the end hooded, in the inside crested. Sepals 5, united at base. Pollen angular.

1878. *Calopogon*. Lip at the back clawed, with a bearded inside. Sepals 5, distinct. Column separate. Pollen angular.

1879. *Pogonia*. Lip sessile, hooded, crested inside. Sepals 5, distinct, without glands. Pollen farinaceous.

1880. *Epipactis*. Lip ventricose below; the extremity either undivided or 3-lobed: the middle lobe the largest, connected as it were by a joint. Pollen farinaceous.

1881. *Caleana*. Lip unguiculate, placed at the back, with a peltate hollow lamina, having a perforation on the outside. Pollen farinaceous.

1882. *Corallorhiza*. Lip produced behind, adnate with the spur or free. Column free. Masses of pollen 4, oblique, not parallel.

§ 4. *Anther terminal, opercular deciduous. Pollen waxy.*

1883. *Rodriguezia*. Perianth 4-leaved ringent. Lip entire, unguiculate cornute at base; callous in the middle. Pollen-masses 2, with an elastic caudicula. Stigma with 2 horns.

1884. *Gomezia*. Like the last, but lip not cornute at base.

1885. *Cymbidium*. Lip not spurred, concave, jointed with the simple base of the columna. Sepals spreading, distinct. Pollen masses 2, 2-lobed behind.

1885. *Brassia*. Lip expanded, undivided. Sepals spreading, distinct. Column not winged. Pollen-masses 2, 2-lobed behind; fixed by the middle to a common process of the stigma.

1887. *Lissochilus*. Pollen-masses 2, obliquely 2-lobed. Lip saccate at base, sessile, undivided, convex at the base, united with the apterous toothless column. Inner sepals divaricating, petaloid; outer reflexed, calcine.

1888. *Geodorum*. Lip cucullate-ventricose, sometimes spurred at base, sessile, not jointed with the column. Sepals like the lip, 1-sided. Pollen-masses 2, lobed at back.

1889. *Catantactum*. Perianth, not inverted, generally globose. Lip saccate, concave, different from the sepals. Pollen-masses 2, 2-lobed behind, inserted on a large naked transverse caudicula, which finally separates with elasticity.

1890. *Trizacis*. Perianth 2-parted; upper segment 2-lobed; lower 3-parted, inflated. Lip parallel with column, with a recurved dilated limb. Stigma excavated. Anther 1-celled, fleshy. Pollen-masses 2, adhering to a fusiform caudicula.

1891. *Xylobium*. Perianth spreading. Lip behind jointed, with an unguiform process of the column, 3-lobed, incumbent on columna. Outer lateral sepals united by their bases, with the process of column. Pollen-masses 2, furrowed on one side, seated on a broad caudicula.

1892. *Mazilaria*. Perianth spreading. Lip in front 3-lobed, jointed with the unguiform process of the column. Lateral outer sepals united by their bases with the process of column. Pollen-masses 2, bipartite, united by their bases to a common gland.

1893. *Notylia*. Perianth 4-leaved: upper sepals spreading. Lip divaricating entire. Columna acuminate. Pollen-masses 2, entire. Anther posterior, not terminal.

1894. *Pleurothallis*. Lip jointed with the simple or slightly lengthened base of column. The two anterior sepals united at base. Pollen-masses 2, not furrowed.

1895. *Oncidium*. Lip expanded, lobed, tubercled at base. Petals spreading, sometimes only 4. Column winged. Pollen-masses 2, 2-lobed behind, fixed by the middle to the common process of the stigma.

1896. *Cyrtopodium*. Sepals 5, distinct. Lip 3-lobed, connected with a joint with the unguiform process of the base of the apterous column. Pollen-masses 2, 2-lobed behind.

1897. *Calogyne*. Perianth resupinate, spreading. Lip 3-lobed, cucullate, jointed with columna. Column winged. Anther lateral, 2-celled. Pollen-masses 2, 2-parted. Stigma funnel-shaped, 2-lipped.

1898. *Macradenia*. Lip sessile, cucullate, concave, undivided, acuminate. Sepals distinct, spreading. Column distinct, with the lobes of its end conniving. Pollen-masses 2, unfurrowed, seated on a long filiform caudicula.

1899. *Dendrobium*. Lip without a spur, jointed with the unguiform process of the column, to whose edges the anterior sepals adhere. Pollen-masses 4, parallel.

1900. *Anisopetalum*. Flowers erect. Sepals conniving. The two lateral exterior large, cohering at end: two inner very small subulate. Lip oblong, with 2 teeth near the base. Pollen-masses 4, without gland or caudicula.

1901. *Camaridium*. Perianth resupinate, expanded. Sepals distinct. Lip distinct, sessile, cucullate, 3-lobed. Column round. Stigma arched. Pollen-masses 4, parallel, compressed, without a caudicula at the time of expansion.

1902. *Ornithidium*. Lip sessile, hooded, connate with the base of column. Sepals conniving. Pollen-masses 4, oblique, furrowed at base.

1903. *Isochilus*. Lip almost of the same shape as the distinct, connivent, sepals. Pollen-masses 4, parallel.

1904. *Pholidota*. Flowers resupinate. Sepals uniuform; the three outer erect, keeled at back. Lip ventricose. Column dilated at end. Anther 2-celled. Pollen masses 1, each pair having a gland.

1905. *Broughtonia*. Column distinct, or at the very base united with the unguiculate lip, which is lengthened at the base into a tube, connate with the ovary. Pollen-masses 4, parallel, with a granular caudicula reflexed upon the masses.

1906. *Cattleya*. Sepals spreading. Lip sessile, cucullate, surrounding the half round column. Pollen-masses 4, with as many powdery reflexed caudiculae.

1907. *Epidendrum*. Column united with the claw of the lip, and forming a tube which sometimes runs down the ovary. Pollen-masses 4, with as many powdery reflexed caudiculae.

1908. *Polystachya*. Perianth, not inverted, cuneate, closed. Pollen-masses 4, placed on a simple naked caudicula with a gland.

1909. *Cryptarrhena*. Sepals 5, distinct, spreading. Lip not spurred, with a dilated flat lamina. Column distinct, not winged. Anther enclosed in the cucullate head of the column. Pollen-masses 4.

1910. *Ornithocophalus*. Flowers resupinate. Lip stalked. Sepals nearly equal; the two upper finally reflexed. Column short, with a very long beak. Pollen-masses 4, adhering to a very long glandular caudicula.

1911. *Bletia*. Lip sessile, cucullate; sometimes spurred at the base. Sepals 5, distinct. Column separate. Pollen-masses 8 or 4, 2-lobed.

1912. *Eria*. Perianthium woolly, conniving or expanded. Lip 3-lobed, jointed with an unguiform process of the column to whose sides the anterior sepals are united. Pollen-masses 8, cohering at the end by means of a powdery substance.

1913. *Octomeria*. Lip jointed with an unguiform process, to the edges of which the anterior sepals adhere. Pollen-masses 8. Perianthium quite smooth.

1914. *Brassavola*. Lip with a simple claw, undivided. Sepals distinct, spreading. Pollen-masses 8 or more.

1915. *Sarcanthus*. Lip fleshy, entire, calcarate; the spur furnished with various appendages in the interior. Sepals spreading equally. Pollen-masses 2, seated on an elastic caudicula.
1916. *Vanda*. Lip saccate, continuous with the simple base of the apterous column, trifid, with the middle lobe fleshy. Sepals spreading, distinct. Pollen-masses 2, obliquely 2-lobed, attached to an elastic caudicula.
1917. *Aerides*. Lip spurred or saccate, inserted at the end of the unguiform process, to whose edges the anterior sepals are united. Pollen-masses 2, two-lobed behind, fixed by a common process to the middle of the stigma.
1918. *Renanthera*. Like the last, but sepals very long and spreading, and lip only a little saccate at base.
1919. *Ionopsis*. Sepals connivent, the anterior placed under the labellum. Lip spurred at base. Pollen-masses 2.
1920. *Eulophia*. Sepals 5, distinct, uniform, ascending, spreading. Lip spurred at base, with a sessile crested lamina, 3-lobed. Pollen-masses 2, two-lobed, with a posterior lobe attached to an elastic caudicula.
1921. *Angreecum*. Sepals conniving, galeate. Lip spurred 3-lobed, jointed with column. Pollen-masses 2. Stigma concave, transverse.
1922. *Aeranthes*. Lip spurred, membranous, entire, jointed with an unguiform process of the column, to which the two front sepals are adherent. Pollen-masses 2, hollow, perforated on one side, with no caudicula, and two glands.
1923. *Calanthe*. Lip spurred, lobed, united with the columna. Perianth spreading. Pollen-masses 8.
1924. *Stelis*. Lip of the same form as the inner dwarf vaulted sepals. Three outer sepals united at base. Pollen-masses 2.
1925. *Mataxis*. Lip flat, expanded, regularly vertical. Column round. Pollen-masses 4, loose.
1926. *Prescotia*. Perianth spreading. Two upper sepals connate at base. Lip behind, erect, fleshy, cuculate, entire, embracing the very minute column. Pollen-masses 2, twin, granular, united by the end to a gland.
1927. *Microstylis*. Lip flat, sagittate, or deeply cordate. Column very small, round. Pollen-masses 4, loose.

History, Use, Propagation, Culture,

1855. *Disa*. A name of unknown meaning, adopted by Linnæus from Bergius. Beautiful Cape heraceous plants, with flowers of various colors, either growing singly, or in long spikes. *Disa cornuta* produces a spike, often a foot or a foot and a half long. *D. grandiflora* has large, nearly solitary flowers, of a brilliant scarlet color. The species are cultivated without difficulty in a stove or in a greenhouse, if the roots are planted in light sandy peat, mixed with a very little loam, and not overwatered. The same treatment is suitable to the other tender tuberous or fibrous-rooted Orchideæ.

1856. *Satyrium*. The aphrodisiacal properties of Orchideous plants induced the ancients to give this name to almost all the species they knew; from *satyrus*, a satyr. The bag-like appendages of the lip have perhaps assisted in the application of the name. The species are mostly handsome plants, with yellow or pink flowers. Mr. Salisbury says, he preserved *Satyrium cucullatum* some years, by attending to planting the bulb in a pot, nearly full of broken tiles, mixed with pure sandy loam, and keeping it quite dry when not vegetating.

1928. *Liparis*. Perianth. spreading. Lip flat, expanded, entire, turned various ways. Column winged. Pollen-masses 4, with neither caudicula nor glands.

1929. *Calypso*. Lip ventricose, spurred beneath near the end. Sepals ascending, 1-sided. Column petaloid, dilated. Pollen-masses 4.

§ 5. *Pollen granular. Seeds not arillate.*

1930. *Vanilla*. Flower jointed with ovary, and deciduous. Lip united at base with columna. Capsule fleshy.

Order 2. DIANDRIA.  Stamens 2.

1931. *Cypripedium*. Lip ventricose, inflated. Column terminated by a petaloid lobe dividing the anthers. Two anterior sepals usually united.

1932. *Stylidium*. Cal. 2-lipped. Cor. irregular, 5-fid; the fifth segment dissimilar. Column reclinate, with a double bend. Anthers with 2 spreading lobes. Caps. 2-celled.

1933. *Gunnera*. Cal. 2-toothed, superior. Cor. O. Style 2-parted. Drupe 1-seeded, crowned by the teeth of the calyx.

Order 3. HEXANDRIA.  Stamens 6.

1934. *Aristolochia*. Cal. O. Cor. 1-petalous, ligulate, ventricose at base. Caps. 6-celled, many-seeded, inferior.

MONANDRIA.

- 12789 Helmet blunt: spur conical deflexed, Inner sepals 2-toothed, Lip obovate velvety flat, Spike lax
- 12790 Helmet erect acute, Lip stalked dilated at end trifid, Stem few-flowered, Leaves linear
- 12791 Helmet blunt: spur obl. keeled convex at back, Lip linear acutish, Spike lax, Bractes shorter than fls.
- 12792 Helmet blunt: spur obl. Lip linear broadest at end, Spike cylindrical, Bractes erect longer than flowers
- 12793 Helmet acute erect: spur conical nodding, Lip linear blunt, Stem about 2-fl.
- 12794 Leaves filiform shorter than 3-flowered scape, Spur blunt ascending

- 12795 Radical leaves twin cordate roundish concave: cauline remote cucullate blunthish
- 12796 Radical leaves twin cordate roundish: cauline sheath-like close, Spike compact, Sepals keeled outside
- 12797 Leaves ovate acuminate somew. reflexed sheathing coriaceous crenated at edge, Fls. and helmet cernuous

- 12798 Horn filiform twice as long as ovary, Lip linear entire, Rad. leaves twin oblong narrowed at base
- 12799 Lip lanceolate obtuse dilated at base, Spur the length of lip a little shorter than the ovary, Stem leafy
- 12800 Lip linear lanceolate, Three upper sepals erect conniving: lateral reflexed, Leaves 2 orbicular

- 12801 Bulbs palmate, Lip trifid entire, Spur setaceous twice as long as ovary
- 12802 Horn short double, Lip linear 3-toothed: lateral teeth acute; middle very short
- 12803 Horn blunt 3 times shorter than ovary, Lip 3-parted: segments acute; middle one largest

- 12804 Lip 3-lob. : lobes cren. obt. midd. one emargin. Seg. of perianth ascend. obt. Spur conic. ascend. shorter than [ovary]
- 12805 Lip 3-lobed: lateral reflexed toothletted; middle shorter than blunt, Spur long comp. truncate ascending
- 12806 Lip 3-lob. crenul. obt. : the midd. lobe cleft, Seg. of the perianth cleft; exterior one reflex. Spur lin. ascend. compressed at the extremity rather longer than the ovary

and Miscellaneous Particulars.

1857. *Platanthera*. So named from $\pi\lambda\alpha\tau\omega\varsigma$, broad, and $\alpha\theta\eta\eta\alpha$, an anther, on account of the width of that organ, which is as broad or broader than the base of the labellum. Curious wood plants with greenish flowers. *Platanthera bifolia* is one of our indigenous plants, which may be cultivated without any difficulty, if planted in pure loam from a lime-stone bottom. It succeeds in a pot, if filled half full of broken tiles; and when in the open ground, the border should be well drained, at least six inches in depth. No plant bears forcing better, or exhales a more delightful perfume. This species is never observed but in a lime-stone soil, and is exceedingly plentiful near Buxton.

1858. *Gymnadenia*. From $\gamma\upsilon\mu\alpha\delta\epsilon\varsigma$, naked, and $\alpha\delta\eta\eta\alpha$, a gland; because it differs from *Orchis* in not having the glands enclosed in a pouch, but altogether uncovered. The principal species of the genus is the *Orchis onopsea* of old botanists.

1861. *Orchis*. The Greek name of the plant. In Arabic, according to Forskahl, it is called *sahhleh*, from

- 12807 Lip 3-part: seg. lin. dotted scabr.; midd. 2-parted, Sepals erect ac. Spur uncin. thrice as short as ovary
 12808 Lip 3-part. dott. scabr.: later seg. obl.; midd. larg 2-lob. cren. with a point betw. Spur straightish thrice as short as ovary, Bractes 4 times as short as ovary
 12809 Lip 4-parted very narrow: segm. filif.; middle longer with a tooth between, Spike conic. Bractes minute
 12810 Lip 3-parted very narrow: seg. lin.; midd. 2-lob. blunt with a point between, Spur straight twice as short as ovary, Bractes obsolete
 12811 Bulbs ovate, Stem leafy, Lip 3-parted scabr.: lat. seg. very narr.: midd. very long bifid with an appendage, Leaves wavy spotted
 12812 Lip 3-lobed dotted: middle broadest with a tooth between, Spur compressed, Outer sep. subul. Spike dense
 12813 Lip 3-part: midd. seg. emarg. Sep. mucron. at end, Spur twice as short as ovar. Spike dense ov. Lvs. lanc.
 12814 Lip 3-parted: lat. seg. lin. sub.: middle long bifid thrice as long as ovary, Spur very short conical double
 12815 Lip slightly 3-lobed: sides reflex. Three inn. segm. of perianth conniv. Spur cylind. shorter than germen, Bract. longer than the flowers
 12816 Lip plane 3-lobed crenate: 3 inn. segm. of perianth conniv.; lat. ones patent, Spur cylind. shorter than the germen, Bract. as long as the germen
 12817 Lip obov. undiv. cren. ret. Sep. straight: lat. long. Spur clav. short. than ovary, Bract. longer than fl. [ovary
 12818 Lip obov. undiv. tooth. emarg. Sep. nerv. conniv. Spur subul. short. than ovar. Bract. membr. col. as long as
 12819 Bulbs undivided, Sepals conniving, Lip trifid: middle segment projecting 2-lobed, Bractes longer than fl.
 12820 Lip trifid dotted: segments ovate serrulate; middle broadest emarginate, Spike ovate compact
 12821 Scape naked, Lip slightly 3-lobed at end, Spur ascending, Bractes as long as ovary

12822 The only species

- 12823 Spur short double, Lip linear retuse 3-toothed: lateral blunt; middle obsol. Bractes twice as long as fl.
 12824 Spur cylindrical shorter than ovary, Lip entire linear oblong [than flower
 12825 Spur filif. shorter than ovary, Lip obl. blunt toothed on each side at base, Palate 1-toothed, Bractes longer
 12826 Spur filiform longer than ovary, Lip 3-parted with cuneiform fringed segments
 12827 Spur filiform shorter than ovary, Lip lanceolate pinnately fringed, Inner sepals toothed cut
 12828 Spur filiform longer than ovary, Lip lanceolate pinnately fringed, Inner sepals fringed cut
 12829 Lip long 3-parted: segm. somewhat digitate filiform, Spur length of ovary, Spike obl. Flowers alternate
 12830 Roots fascicled, Lip lanc. ciliated the length of upper sepals, Spur very long a little shorter than ovary
 12831 Sepals conniving, Lip nearly equal broad ovate bluntly 3-toothed, Spur filiform curved longer than ovary

12832 The only species

12833 The only species

- 12834 Lip 3-cleft: lobes eq. ent. with 2 longitud. append. on upp. side near base, Seg. of perin. lanc. 2 outer ones [spread. Spur filif.

12835 Lip the length of ovary

- 12836 Lip 3-fid: middle lobe largest 1/2-trifid; middle segm. longest subulate deflexed
 12837 Lip 2-lobed villous obovate appendaged, Sepals spreading: three outer oblong blunt; inner very short
 12838 Lip 3-lobed: lateral short blunt: middle retuse

and Miscellaneous Particulars.

Orchis fusca and *militaris*, according to Salisbury, succeed best in chalky soil, free from all manure whatever; but they will endure more moisture than would be supposed; for he found them in a very wet part of the meadow below the terrace, at Mill Hill, where they had, no doubt, been planted by Mr. Peter Collinson. *Gymnadenia conopsea* affords another singular instance of this sort, which is found growing wild on the driest limestone, mixed with *Anacamptis pyramidalis*, and in bogs where one can hardly tread, mixed with *Epipactis palustris*.
 1860. *Nigritella*. So named by M. Richard, from *niger*, black, in allusion to the color of the flowers.
 1861. *Habenaria*. From *habena*, a thong or rein, on account of the long spur of the flower, which resembles something of that sort. Most of the species have white flowers, and natives of America. Some have bright yellow flowers, others purple ones.
 1862. *Bartholina*. Named in honor of Thomas Bartholini, a Danish physician, who flourished at the end of the seventeenth century. A small Cape plant, with a beautifully fringed white flower.
 1863. *Glossula*. So called by Mr. Lindley, from *γλωσσα*, a tongue, in reference to the tongue-like segments of the labellum.
 An obscure Chinese plant, with pale green minute flowers.
 1864. *Anacamptis*. From *ανακαμπτω*, to bend back, in allusion, it is presumed, to the reflexed edges of the appendage of the pollen-masses. In all respects similar to *Orchis* in habit. It is the *Orchis pyramidalis* of Linnæus.
 1865. *Aceras*. From *α*, without, and *κερας*, a horn, in allusion to the absence of the spur from the labellum, by which character it is chiefly distinguished from *Orchis*. *Aceras anthropophora* is difficult to cultivate. It can only be propagated by seeds, which thrive best in a mixture of sand, loam, and chalk.
 1866. *Ophrys*. From the Greek word *οφρυς*, which signifies an eye-lash, to which the delicate fringe of the inner sepals may be very well compared. *O. apifera* is a singularly beautiful plant, not uncommon on calcareous soils, near woods, and in open meadows. It ripens seeds plentifully, as will all the species, if care be taken, as

History, Use, Propagation, Culture,

Sweet directs, to "rub the pollen on the stigma." The seeds must be sown as soon as ripe, and the plants transplanted to where they are finally to remain, in a small size. Several species of this genus, and of *Orchis*, were successfully cultivated by Collinson, when his botanic garden at Mill-Hill. His method was to place them in a soil and situation as natural to them as possible, and to suffer the grass and herbage to grow round them. *O. aranifera*, with a little attention and management, will grow and flower freely in pots. Curtis found the following method successful: "take up the roots carefully when in flower; bare them no more than is necessary to remove the roots of the other plants; fill a large sized garden-pot with three parts choice loam moderately stiff, and one part chalk, mixed well together, and passed through a sieve somewhat finer than a common sander sieve; in this mixture place your roots at about the depth of two inches, and three inches apart; water them occasionally during summer, if the weather prove dry; at the approach of winter place the pot in a frame under a glass, to keep it from wet and frost, which combined, destroy the beauty of the foliage, if not the plant itself; in the autumn, before any of the others make their appearance, this species emerges." (*Curtis, Fl. Lond. n. 68.*)

Salisbury says, that *Ophrys muscifera*, and most of its congeners, are very easily cultivated; but require the purest loam from a chalky bottom, and the border to be most effectually drained; for any permanent wet in summer makes them push too soon. On the hillocks and declivities where they grow wild, the slight showers are absorbed by the surrounding turf or long grass, and the heavy rains we usually have after midsummer-day run off quickly.

1867. *Chamorchis*. From *χαμας*, dwarf, and *Orchis*. A pretty little alpine plant, exceedingly difficult to cultivate. Roots have been brought in damp moss from Switzerland, but they probably have perished ere now.

1868. *Herminium*. A name which is not explained by its author. It is the *Ophrys Monorchis* of old botanists.

1869. *Serapias* is the name of an Egyptian divinity, whose temples were notorious scenes of profligacy. In this sense, with reference to the uses of the plant, as also in *Satyrium*, the word seems to have been applied by Pliny. Rare herbaceous plants of the south of Europe, but cultivated in a frame.

1870. *Goodyera*. So called after Mr. John Goodyer, an obscure British botanist. The species grow freely in sandy peat, and, unlike most of the *Orchideae*, may be increased by dividing the roots.

- 12839 Lip 3-fid : middle lobe large 2-lobed, Anther blunt
 12840 Stem leafy, Lip vill. 3-lobed : midd. lobe obov. shortly 3-lobed at end, Inner sepals linear-lanc. very short
 12841 Stem leafy, Lip downy obov. 3-lobed at end : lobes nearly equal, Inner sepals lanc. twice as short as outer
 12842 Leaves linear setaceous, Scape naked
 12843 The radical leaves lanceolate twin
 12844 Lip 3-parted : middle lobe oblong lanceolate acute smoothish hanging down
 12845 Lip 3-parted : middle lobe ovate acuminate hanging down with a hairy disk
 12846 Radical leaves ovate, Lip and petals lanceolate
 12847 Radical leaves ovate, Lip ovate acuminate, Sepals ovate
 12848 Leaves fleshy chocolate-colored ovate without nerves
 12849 Stem leafy, Leaves ovate-lanceolate stalked, Lip rounded glandular inside, Petals broad ovate
 12850 A smooth variety of *G. pubescens*

12851 Leaves linear channelled shorter than scape, Middle segm. of lab. with a double keel inside

- 12852 Lip unguiculate acuminate, Inner sepals $\frac{1}{2}$ -ovate
 12853 Spike lax erect, Leaves stalked erect crisp smooth, Flowers discolored

12854 The only species

- 12855 Rad. lvs. obl. lanc. Scape with bractes, Anterior sepals decurrent placed under the $\frac{1}{2}$ -inferior labellum
 12856 Lip obovate emarginate, Scape sheathed, Bractes shorter than flower, Leaves ovate stalked flat at edge
 12857 Leaves linear-lanc. Lip subsessile crenulate at end, Sepals ovarium and rachis quite smooth
 12858 Lvs. linear lanceolate 2-colored, Scape villous much longer than leaves, Fl. gibbous on its outside at base
 12859 Leaves lanceolate 3-nerved, Stem sheathed, Flowers recurved cernuous, Lip oblong entire acute
 12860 Rad. leaves oblong somewhat stalked, Spike twisted with the flowers on one side, Lip ovate

12861 Lip lanc. undivided, Scape bracteate, Bractes longer than flower, Leaves oblong way towards the end
 12862 Rad. leaves broad lanceolate, Spike erect, Lip saccate at base with the sepals, Lip acuminate

- 12863 Stem with only a pair of ov.-ellipt. opp. lvs. Col. of fructification having an appendage in which the anther [is placed
 12864 Stem with only 2 cordate opposite leaves, Col. without any appendage behind, Lip with 2 teeth at the base

12865 The only species, Flower solitary large lilac

and Miscellaneous Particulars.

1871. *Diuris*. From *dis*, double, and *ura*, a tail, in allusion to the form of the sepals. Beautiful New Holland plants, which may be cultivated in the same way as *Disa*.

1872. *Ponthieva*. Named after De Ponthieu, who sent many specimens of West Indian plants to Sir J. Banks. The species may be cultivated in pots, well drained, and filled with sandy loam and peat. Water must be sparingly given when the plants are not in a growing state.

1873. *Neottia*. This word in Greek signifies bird's nest, and has been applied to the present plant on account of the interwoven fibres of its roots. No means of cultivating the only species has been yet discovered. It grows naturally in woods among decayed leaves, and is supposed to be parasitical.

1874. *Spiranthes*. From *σπῆρα*, a screw, or any thing spirally twisted; on account of the disposition of the flowers on their spike. Delicate little herbaceous plants with fibrous roots, and generally white flowers. *S. æstivalis* has the germs on the flower-stalks placed regularly one above another, somewhat resembling tresses of plaited hair; whence its name of Ladies' traces or tresses. This species grows more readily in the garden than most of its tribe.

According to Salisbury, no plant whatever is more easy to cultivate than this. At Chapel-Allerton it propagated itself every where, springing up from seeds in the neighbouring pots, whatever soil or plants happened to be in them; and they were once found germinating on a dead root of a Persian *Cyclamen*, in a pot, which, for want of draining, was full of *Jungermannias*.

1875. *Stenorhynchus*. A splendid genus of evergreen stove herbaceous plants, with brilliant red or yellow flowers. They have been named from *σῆνος*, narrow, and *ῥυγχος*, a beak, on account of the long pointed stigma. *N. orchioides* is one of the most beautiful plants of this genus, introduced by E. J. A. Woodford, Esq. in 1806, from the Island of Barbadoes, where it grows wild in the most arid places among grass. It requires, nevertheless, moderate waterings here while the leaves are green.

1876. *Listera*. Dr. Martin Lister was a celebrated English physician and naturalist, who died in 1711. The species require a shady situation and a light sandy soil, with some peat intermixed. They will grow on a bank under the drip of trees, or in small pots. They are increased by dividing the roots.

1877. *Arethusa*. A poetical name. *Arethusa* was a nymph of Diana, who was transformed into a fountain. The species of this genus are all found in moist places. They are very impatient of cultivation. The best way to manage them, is to plant them in loose wet peaty soil, and to keep them in a frame well exposed to the sun

History, Use, Propagation, Culture,

1878. *Calopogon*. From *καλος*, beautiful, and *πωγων*, a beard, in allusion to the beautiful fringe of the lip An elegant plant, which was introduced accidentally, as Mr. Curtis informs us, by the laudable exertions of his gardener, who, in the spring of 1783, examining attentively the bog earth which had been brought over with some *Dionæas*, found several tooth-like knobby roots, which, upon being planted in heat, afforded this plant: on the shelf of a stove, or on a bark pit it thrives exceedingly; and seems merely to require a longer and hotter summer than our climate affords.

1879. *Pogonia*. A name with the same derivation as the last genus. The species also require the same treatment.

1880. *Epipactis*. A name given by the Greeks to a sort of Hellebore, and used by Swartz to distinguish a tribe of plants previously called Helleborine. Pretty herbaceous hardy plants. "Some of its species thrive in the borders in the common garden soil, and most of them will do well in pots, in a mixture of loam and peat; they require but little water when in a dormant state, and are increased by dividing the roots." (*Bot. Cult.* 365.)

1881. *Caleana*. Named after Mr. George Caley, a most indefatigable and acute botanical collector, who resided several years among the natives of New South Wales, where he made a valuable collection of plants. The name has been subsequently changed by Mr. Brown to *Caleya*: which as being too similar to *Calea*, a very different plant, we cannot prefer to the original designation. The species require the common treatment of the tribe, and are increased by division of the roots.

1882. *Corallorrhiza*. From *κοραλλιον*, coral, and *ριζα*, a root, on account of its branched roots, which much resemble coral. A plant supposed to be incapable of cultivation. It is a native of boggy places in the northern parts of the world. The three American species *C. varia*, *multiflora*, and *odontorrhiza*, are said to have been introduced in 1824, but we have not heard of their having been cultivated with any success.

12866 Leaves plaited long linear lanceolate. The only species

12867 Root fibrous, Leaf of the scape and bractea elliptical lanceolate, Outer sepals oblong-ovate

12868 Root subpalmate, Leaf and bractea of scape linear oblong, Outer sepals lanceolate linear

12869 Leaves ovate squamiform amplexic. Fls. subcernuous solitary, Middle lobe of lip obl. crisp, Stem angular

12870 Lvs. ov. amplexic. Lower bractes long. than fls. Fls. drooping, Lip entire acuminate shorter than petals

12871 Lvs. lanc. amplexic. Bractes short. than fl. Fls. slightly drooping, Lip cren. obt. rather long. than perianth

12872 Leaves ovate-lanceolate sessile, Bractes longer than the flower, Lip obtuse shorter than perianth

12873 Lvs. lanc. much acum. substiethic. Bract. very minute subul. Fls. erect, Lip obt. much short than perianth

12874 Lvs. lanc. Bractes longer than ovary, Flowers erect, Lip acute with wavy elevated lines, Ovary smooth

12875 Leaf lanc. lin. flat, Scape with a single bract in the middle, Lip smooth narrowed and $\frac{1}{2}$ -ovate at each end

12876 Spur abbreviated adnate

12877 Spikes nodding 1-sided, Leaves lanceolate complicate

12878 Spikes nodding 1-sided, Leaves lanceolate flat

12879 Stemless, Leaves growing on a bulb : radical sheathing, Scapes many-flowered, Ovary 3-winged

12880 Leaves radical broad-linear channelled fleshy retuse at end, Scapes many-flowered pendulous

12881 Leaves radical ensiform nerved, Scape round few-flowered, Lip ovate somewhat recurved spotted

12882 Leaves radical ensiform nerved, Scape few-flowered, Flowers 1-sided, Sepals striated : 3 outer reflexed

12883 Leaves radical lanceolate nerved narrowed at base, Scape round few-fl. Lip obl. recurved at end spotted

12884 Bulbous, Leaves plaited, Racemes divaricating pendulous radical

12885 Leaves thickish lin.-subulate channelled nerved crenate as long as scape, Spike few-fl. Lip not spotted

12886 Sepals lanceolate spreading not longer than ovary

12887 Sepals linear lanceolate acuminate : the lower caudate very much longer than ovary

12888 The only species. A tall plant with long rigid linear lanceolate leaves on a bulbous base

12889 Scape longer than leaves, Raceme pendulous, Flowers alternate, Lip ovate acute pointed

12890 Scape shorter than lvs. Spike pendulous, Fls. close, Lip somewhat spurred at base blunt and entire at end

12891 Scape shorter than lvs. Spike pendulous, Fls. close, Lip somew. spurred at base dilated and crenul. at end

12892 Two inner sepals spotted, Lip galeate 3-toothed

12893 Spike shorter than leaves, Leaves galeate fleshy 3-toothed at end, Sepals oblong : inner spotted

12894 Spike short. than lvs. Lip gal. blunt 3-tooth. Two inner sep. mott. with purple, others as well as col. green

and Miscellaneous Particulars.

1883. *Rodriguezia*. Named by the authors of the Flora Peruviana, after Emanuel Rodriguez, a Spanish physician, and, as it is said, of considerable botanical merit. A beautiful herbaceous plant, growing upon decayed wood. Its flowers are placed in cernuous racemes of a lively pink color.

1884. *Gonexa*. So called by Mr. Brown, in honor of Senor Goines, a Spanish apothecary. Mr. Lindley thinks it not distinct from the last. A bulbous epiphyte, with drooping spikes of yellow flowers.

1885. *Cymbidium*. From *κυμαζην*, a little boat, in allusion to the form of the labellum. All the genuine species of *Cymbidium* are terrestrial, and rarely are found growing upon trees. In cultivation the species grow in loam, chips of wood, potsberds, and other rubbish, broken small, and put in well-drained pots. They are increased by dividing at the root.

1886. *Brassia*. Named after Mr. Brass, an intelligent gardener, who collected seeds and plants in Africa for the Kew Garden. The two species now known are among the most beautiful of the various tribes of Epulendrum. *Brassia maculata* has large pale yellow flowers, elegantly spotted with brown; *B. caudata* has similar flowers, with long tails to their lower segments.

1887. *Lissochilus*. From *λίσσος*, smooth, and *χίλος*, a lip, in reference to the absence of callosity or crests from that part. An exceedingly rare and very noble plant, which grows freely in sandy loam with a little peat. The flowers grow in long spikes of a bright yellow color.

1888. *Godorum*. From *γός*, the earth, and *δωρος*, a gift, in reference to the beauty of the blossoms lying on the earth. Handsome plants, succeeding with the treatment of *Cymbidium*.

1889. *Catacactum*. Apparently a word of hybrid extraction, from *κατα*, and *ακτα*, a bristle, in allusion to the two long bristles or horns of the column, which constitute one of the most remarkable characters of the genus.

History, Use, Propagation, Culture,

Very fine epiphytes, with large bulbous roots, plaited leaves, and fine, often spotted, flowers of a greenish purple color. The bulbs contain a quantity of viscid juice, which is used, when fresh, in Brazil, for the purpose of sealing letters. The plants are there called *Cebolleta*.

1890. *Trizeuxis*. So called by Mr. Lindley without explanation. We suppose the name has been formed from *τριξ*, three, and *ἕνωσις*, union, in allusion to the remarkable union of three segments into one, which takes place in this genus. A very singular epiphyte, which is with difficulty kept alive in the stove by being placed in finely pulverized decayed wood.

1891. *Xylobium*. From *ξύλον*, wood, in allusion to the substance upon which it grows. A curious Brazilian bulbous epiphyte with plaited leaves. This is of easy cultivation.

1892. *Maxillaria*. So called by the authors of the *Flora Peruviana*, as they inform us, because the tabellum when looked at sideways, resembles the *Maxilla* of some insects. All fine South American plants, with plaited leaves and showy flowers. They are cultivated like other epiphytes, and not with much difficulty.

1893. *Notylia*. So called, we presume, from *νοστος*, the back, and *πυλός*, a hump, in reference to a singular callosity at the back of the stigma, which Mr. Lindley, the author of the genus, considers very curious. An unostentatious epiphyte without bulbs, and with solitary leaves, out of the bosom of which grows a pendulous raceme.

1894. *Pleurothallis*. From *πλευρά*, a rib, and *θάλλω*, to flower, in allusion to the one-sided disposition of the flowers. Singular little epiphytes with solitary leaves, no bulbs, and flowers of a green color. They grow rarely in decomposed wood.

12895 Spike length of leaves erect, Flowers globose, Sepals rounded
12896 Perianth. spreading, Lip opened out saccate crested

12897 The only species. Flowers very small in little heads upon a branched scape

12898 Bulbs conical truncate, Flowers close, Leaves lanceolate plaited about 3-nerved twice as long as scape

12899 Leaves about 3 oblong nerved seated on a bulb, Scape about 1-flowered sheathed

12900 Lvs. solitary lanc. plaited, Raceme 2-fl. Perianth. very large wavy spreading, Lobes of lip recurved crisp

12901 Spikes pendulous lax as long as the narrow oval nerved leaves

12902 Stem long 1-leaved, Scape erect longer than obl. emarginate leaf, Fls. racemose 1-sided

12903 Stem long 1-leaved, Leaf ovate-lanceolate, Flowers clustered in the bosom of the leaf

12904 Sepals 5 lanceolate longer than lip, Scape panicle

12905 Sepals 5 obovate unguiculate a little shorter than lip, Scape panicle

12906 Sepals 4 ovate wavy, Lip long, than sep.: midl. lobe dilated reniform $\frac{1}{2}$ -bifid, Scape racem. Bulbs $\frac{1}{2}$ -leaved

12907 Sepals 4 acute, Middle lobe of lip roundish undivided, Scape racemose, Leaves 3-cornered

12908 Leaves ellipt. acute, Scape upright branched, Sepals wavy retuse spreading nearly equal, Lip reniform

12909 Lvs. flat obl. lanc. Sepals 5 obovate undulate blunt, Lip transverse shorter than seg. bearded in the middle

12910 Lip 2-lobed spotted much longer than the sepals, Bulbs ovate comp. leafy at base and end, Scape panicle

12911 Lvs. rigid oval oblique, Panicle thyrsoid length of lvs. Sep. obov. Lip 3-lobed crested, Wings of col. cut

12912 Lvs. solitary oval dotted spread. Scape jointed 2-edged few-fl. Upper sepals lin. very long, Col. 2-horned

12913 Lip narrow clawed: lateral lobes divaricating longer than the middle which is hollowed out

12914 Lip ventricose: lateral lobes shorter than middle which is crested and callous

12915 Bulbs fascicled, Lvs. lanc. atten. at base, Sepals lanc. finely dotted, Midl. lobe of lip acute, Crest obsolete

12916 Bulbs and leaves coriaceous and shining

12917 Lvs. twin obl. lanc. spreading, Fls. terminal solitary, Inner sepals filiform, Lip fringed with two crests

12918 Bulbs 1-leaved: leafy at base, Leaves oblong 3-nerved, Spike erect shorter than leaves

12919 Leaves lanceolate keeled solitary on their bulb, Spike imbricated radical very little longer than the bulb

12920 Stems erect 2-3-leav. at end, Lvs. oval obl. shorter than many-fl. terminal raceme, Sepals narrow oblong

12921 Stems creep. Lvs. oval blunt depressed fleshy several times shorter than raceme, Sepals long linear acute

12922 Stems pendul. Lvs. bifarious lanc. acum. Ped. opp. the leaves about 2-fl. Lip undivided ov. cucul. at base

12923 Stems pendul. Lvs. bifarious broadly lanc. Pedunc. about 2-fl. Lip undiv. tubul. oblique almost truncate

12924 Leaves lanc. striated, Racemes many-fl. Lip undivided obliquely campanulate fringed

12925 Stem branched somewhat compr. tuberous at base, Leaves ovate-lanc. Spikes erect, Fls. remote alternate

and Miscellaneous Particulars.

12925 *Oncidium*. From $\sigma\gamma\alpha\kappa$, a tumour, on account of the callosities with which the disk of the labellum is covered. Among the most beautiful of epiphytic plants, conspicuous by their long loose panicles of olive-colored or yellow flowers. *Oncidium altissimum* grows to the height of three or four feet. O. Papilio, the curious Butterfly-plant of Trinidad, has large yellow and red blossoms poised on slender footstalks, and dancing about in the air like some gaudy insects. All the species are cultivated without any difficulty in almost any soil, with plenty of heat and moisture.

12926 *Cyrtopodium*. From $\kappa\upsilon\tau\omicron\sigma$, convex, and $\tau\upsilon\sigma$, a foot, in allusion to the labellum of the original species. These are handsome bulbous plants, growing either upon the ground or upon trees. They are rather difficult to manage well, and are seldom seen in collections. Their flowers, which are handsome, are rarely produced.

12927 *Calogyne*. So named by Mr. Lindley, from $\kappa\alpha\lambda\omicron\sigma$, hollow, and $\gamma\upsilon\gamma\eta$, a female, on account of the form of the stigma, which is peculiar for an Epidendrum. Some of the species, natives of Nepal, which have not yet been introduced into our gardens, are the most beautiful bulbous epiphytes, with shining fleshy leaves, and spikes of gorgeous flowers proceeding from a rigid imbricated scaly base.

12928 *Macradenia*. From $\mu\alpha\kappa\rho\alpha\sigma$, long, and $\alpha\delta\eta\sigma$, a gland, on account of the long subulate process to which the pollen-masses are attached. A singular little epiphyte with yellowish brown flowers.

12929 *Aisopetalum*. From α , without, $\iota\omicron\sigma$, equal, and $\pi\epsilon\tau\alpha\lambda\omicron\sigma$, a petal, on account of the inequality of the sepals, or petals as they commonly called. A curious Nepal plant, with bulbous roots, and little erect spikes of brownish flowers.

12930 *Dendrobium*. From $\delta\iota\sigma\delta\epsilon\iota\sigma$, a tree, with reference to the habit of the species in growing upon trees. In the woods of the East Indies they climb and twist themselves about the branches of live trees, or throw

History, Use, Propagation, Culture,

down their long shoots almost in the same manner as the Mistletoe in England. The flowers are generally very beautiful, and frequently highly fragrant: they vary from a deep yellow to nearly white. All the species in the gardens are cultivated without the least difficulty by being planted in any light vegetable earth. Sometimes they are put in baskets among damp moss, but they do not succeed so well under that treatment as when planted in earth.

1901. *Camaridium*. Named by Mr. Lindley, from *καμαροεια*, an arched roof. The stigma of this genus has the upper lip vaulted in a remarkable degree. An elegant leafy caulescent bulbous epiphyte, with solitary white flowers.

1902. *Ornithidium*. From *ορνιθις*, a bird, in allusion to the resemblance which exists between the cuspidate upper lip of the stigma, and a bird's beak. The habit of this plant is like that of the last, but the flowers are red. They are both cultivated without difficulty in a stove, by being planted among rotten wood, or tan.

Mr. Salisbury says, *Ornithidium coccineum* is a parasite on old trees, near torrents, in the island of Martinico; its fibrous roots insinuating themselves into the crevices of their moist bark. Here it thrives exceedingly, in pots filled with the same, flowering at various seasons, but chiefly in October and November. During summer it should be placed in a shady part of the stove, and often sprinkled with water, but it requires little or none in winter, especially when plunged.

1903. *Ischilus*. From *ισος*, equal, and *χιλιος*, a lip, because the lip and the other divisions of the flower are of nearly equal breadth. The species grow in baskets of moss and old tan, or planted in pots of sandy soil, and chips of wood, and other dry rubbish. They are increased by divisions at the root.

1904. *Pholidota*. A singular bulbous epiphyte, native of Nepal, remarkable for the close manner in which the flowers are covered over by the imbricated scale-like bractea, from which circumstance (*φολις*, a scale), we

- 12926 Stems erect 2-3-leaved at end, Leaves oval obl. entire shorter than terminal many-fl. raceme
 12927 Stem round jointed striated moniliform naked quite simple, Leaves oblong lanceolate
 12928 Stems creeping, Leaves obl. lanceolate acute fleshy the length of the few-flowered spreading raceme

12929 The only species

12930 Flowers small and appearing in the axillæ of the long leaves, Stems branched bulb-bearing

12931 Spike terminal, Leaves distichous linear blunt emarginate, Stem simple
 12932 Flowers axillary, Leaves distichous lanceolate oblong, Stem prolificus, Bulbs axillary 2-leaved

12933 Lvs. solitary on a truncated conical naked bulb: lanceolate plaited, Raceme pendulous densely imbricated

12934 Leaves twin oblong seated on a bulb, Scape divided

12935 Outer sepals linear lanceolate acute 3 times as narrow as inner, Lip undivided
 12936 Sepals nearly equal obtuse, Lip 3-lobed with the middle lobe saddle-shaped
 12937 Sepals lanceolate: inner narrower wavy obtuse, Middle lobe of lip cordate lunate

12938 Leaves twin oblong seated on a bulb, Scape long, Lip cordate blunt
 12939 Leaf lanceolate seated on a bulb, Scape short many-flowered, Lip cordate acuminate
 12940 Stem simple, Leaves oblong emarginate, Peduncle terminal very long, Spike lax 1-sided
 12941 Stem simple, Leaves obl. or acuminate, Peduncle terminal long, Spike globose, Col. shorter than sepals

12942 Stem simple, Leaves oblong, Peduncle terminal long, Spike lax, Lip toothed ciliated
 12943 Stem simple, Leaves obl. somewhat emarginate, Flowers clustered in the bosom of a terminal leaf
 12944 Stem simple, Leaves ov. lanc. amplexicaul. Flowers spiked nodding, Lip 3-lobed: middle lobe 3-toothed
 12945 Stem simple, Fls. spiked erect, Lip 3-lobed: middle lobe retuse, Inner sepals narrower, Leaves lanceol.
 12946 Stem simple, Lvs. twin oblong veinless, Lip 3-parted: middle segm. subulate longest; lateral fringed
 12947 Stem simple, Leaves 3, Spike remote few-fl. Lip 3-parted: middle segm. linear; lateral cut fringed
 12948 Stem simple 2-edged, Leaves oblong, Panicle terminal much branched, Lip cordate acuminate
 12949 Stem simple, Leaves obl. veinless, Flowers terminal, Lip 3-parted entire: intermediate segm. linear long
 12950 Stem 1-leaved, Leaf ellipt. lanc. obt. Raceme few-fl. from the bosom of the leaf, Two inner sepals small
 12951 Stem creeping bulbiferous, Bulbs 2-leaved 1-flowered, Lip cordate

12952 Spike compound: spikelets alternate erect, Flowers smooth
 12953 Spike panic. thyriform, Leaves lanc. 7-nerved longer than scape, Fls. and ovaries downy, Bulbs ovate

12954 Leaves tufted lanceolate nerved shorter than erect spike

and Miscellaneous Particulars.

presume, Mr. Lindley has constructed the name. No explanation, however, of his names is ever given by this author, who seems to attach too little importance to the etymology of botany.

1905. *Broughtonia*. Named by Brown, in the Hortus Kewensis, without explanation. A handsome plant with fine scarlet flowers. It is very rare, and cultivated with little success.

1906. *Cattleya*. Named by Mr. Lindley, after William Cattley, Esq. a munificent encourager of botany, and his early friend. A superb genus of bulbous epiphytes, with fleshy leaves growing in pairs, and large violet or yellow flowers.

1907. *Epidendrum*. From *επι*, upon, and *δενδρον*. All the species are found naturally growing upon trees, not however, as De Theis tells us, sucking their sap, by insinuating their little roots beneath the bark, but vegetating in the soil which collects upon the forks of the branches. Many of the species have singular flowers, but none of those in the gardens are remarkable for their beauty. They are generally cultivated with less difficulty than most other epiphytes. Salisbury tells us, *Epidendrum ciliare* should be planted in pots, filled with porous stones, a few decayed leaves, and knobs of bark taken fresh from the woods: but it requires very little water; and if the leaves turn yellow, it is a sign that they have either too much wet, or too much sun. With such treatment, by keeping four or five pots of it, the stove will be enlivened with their long tubular flowers, slowly succeeding one another, at most periods of the year. It is easily propagated by dividing its stems.

1908. *Polystachya*. From *πολυς*, many, and *σταχυς*, a spike, on account of the compound nature of the inflorescence. Inconspicuous plants, requiring the treatment applied to similar kinds.

1909. *Cryptarrhena*. A pretty little stemless epiphyte with distichous leaves, and neat yellow flowers. It was named by Mr. Brown, from *κρυπτος*, concealed, and *αγενς*, a male, on account of the hooded apex of the column which covers up the anther. The plant is believed to be now lost to the gardens.

History, Use, Propagation, Culture,

1910. *Ornithocephalus*. A very curious little plant, only an inch or two in height, found in Trinidad growing upon rotten sticks in the woods. It bears two or three green flowers, which contain a column, the upper extremity of which is lengthened out into a fine subulate process, resembling a snipe's bill in miniature, whence the name, from *ορνιθίς*, a bird, and *κεφαλή*, a head. No successful method of cultivating this plant has yet been discovered.

1911. *Bletia*. Dedicated to Luis Blet, a Spanish apothecary, who has always, as we are informed by the authors of the *Flora Peruviana*, distinguished himself in his botanical studies. Very noble plants, growing in the earth.

Bletia Tankervillei is a common but beautiful species. The first plant which flowered in this country, was cultivated at Apperly Bridge, near Bradford, in Yorkshire, in May 1776, and had been sent there to Mrs. Hird, by her uncle, Dr. Fothergill, in a black Chinese pot full of stiff loam, in which it had been imported. Many small bulbs, with leaves like those of a snow drop, grew near the edge of the same pot in a regular circle, and these afterwards proved to be *Amaryllis Aurca*. The *Bletia Tankervillei* delights in warmth, fresh loam, and plenty of water, by which treatment, and attention to fecundate the stigma, it will ripen fruit abundantly.

1912. *Eria*. From *ερίος*, wool, on account of the wooliness of the flower of all the known species. Curious epiphytous plants, with bulbous roots, and flowers usually of a yellowish color. They differ from *Dendrobium* chiefly in the number of their pollen-masses, and in habit. *E. stellata* is a fine free-growing plant, with long broad fleshy leaves, and spikes of beautiful brown-yellow flowers nearly a foot and half in length.

1913. *Octomeria*. So called by Mr. Brown, with reference to the eight parts, *οκτώ*, and *μέρος*, into which the pollen is divided. A singular little plant, with filiform leaves and small nearly solitary flowers. The true limits between this genus and the last remain to be determined. The two seem to be separated by nature.

1914. *Brasavola*. Named after Antonio Musa Brasavola, an Italian botanist, born at Ferrara in 1500. Plants with long subulate fleshy leaves, and large white flowers. They are cultivated without difficulty in peat and sand, if good decomposed wood is not to be procured.

1915. *Sarcanthus*. A curious genus of plants not remarkable for their beauty. Their habit is various, but always caulescent; their flowers either yellow or yellowish, marked with various shades of purple. The name

12955 Leaves distichous obtuse compressed

12956 Lip spurred undivided: spur short, Leaves radical ovate lanceolate

12957 Lip not spurred: ribs of the disk branched; middle lobe broader than long, lateral narrower upwards

12958 Lip not spurred: ribs of the disk simple; middle lobe somewhat cuneiform, lateral broader at end

12959 Lip not spurred beardless, Pollen-masses 4, 2-lobed, Stem leafy, Flowers racemose

12960 Lip not spurred with a callus in the inside near the base, Stem leafy, Flowers capitate

12961 Leaves linear-lanceolate plaited, Sepals connivent, Scape higher than leaves

12962 Lvs. lanc. fleshy 5-nerved, Sep. ov. lanc. acum: midd. lobe of lip acum. Ovary and outer sep. ferruginous

12963 Bulbobl.-ov. Lvs. distich. lanc. smooth, Fls. loosely spik. Lip obl. 3-lobed, Three exterior sep. unit. at base

12964 Stem long 1-leaved, Leaf lanceolate, Peduncles twin 1-flowered, Root creeping

12965 Stem 1-flowered, Lip ciliated

12966 Stem paniced, Spur straight hanging down scarcely so long as ovary, Leaves bifid and unequal at end

12967 Leaves subulate, Lip spurred 2-celled, Raceme shorter than leaves

12968 Leaves lanc. flat somewhat recurved, Spike simple horizontal, Lip and anther rostrate

12969 Caulicent, Leaves remotely distichous broad linear channelled obtuse, Spikes opp. the leaves

12970 Sepals oblong obovate wavy, Leaves obliquely 3-toothed at end

12971 Lip without a spur, Sepals linear-lanceolate nearly equal, Leaves cylindrical

12972 Spur ascending conical subulate, Middle lobe of lip shorter than lateral ones, Leaves blunt

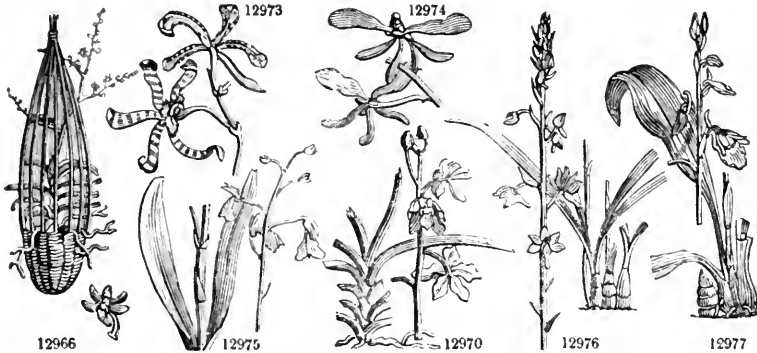

12973 Stem branched rooting, Leaves lanceolate, Sepals revolute dilated at the end, Lip bifid in front

12974 The only species

12975 Leaves lanceolate lined flat, Scape paniced, Sepals shorter than the lip

12976 Scape very slender 3 times as long as the lanceol. 3-nerved leaves, Spur clavate, Midd. lobe of lip obsolete

12977 Leaves lanceolate nerved, Spur ascending, Lip membranous complete

and Miscellaneous Particulars.

has been given by Mr. Lindley, from $\sigma\alpha\zeta\zeta$, flesh, and $\alpha\upsilon\delta\sigma\sigma$, a flower, in allusion to the texture of the sepals and labellum.

1916. *Fanda*. The Hindoo name of the original species. Noble caulescent plants adhering to old decayed arms of trees or fallen wood, by means of their tendrill-like fleshy tortuous roots. The flowers of all the species are large and showy. Their treatment is the same as the next.

1917. *Aeridea*. Derived from *aer*, the air; in allusion to the peculiar property the species possess of existing many months suspended in that element. This genus and the two last are those to which the name of Air-plant is most properly applied, very few others being capable of enduring for any considerable period such a removal from their natural places of growth. The true species of this genus are beyond all comparison the most delightful productions of the vegetable world. Their flowers are arrayed in long spikes or racemes of delicate colors and delicious fragrance. Hung up in a room in their native country, a little before flowering, they continue to unfold their blossoms in gradual succession for many weeks. In this country they are rarely seen in flower. The only genuine species, the *A. odoratum*, should be planted in rotten wood with a little peat, or a few decayed leaves, or any light black vegetable mould, and kept in the hottest and dampest place of the stove. If put in baskets among moss and kept very damp, the plants will succeed for a short time, but they soon languish, and put on a yellow appearance, the certain indication of unhealthiness.

1918. *Renanthera*. A name contrived by Loureiro, to express the kidney-form or reniform shape of the pollen-masses. This plant is not uncommon in good collections, where it has sometimes acquired the height of six or eight feet; but it has never yet produced its flowers. These appear, in the native country of the plant, in large loose panicles, and are individually of considerable size and of a rich crimson color, a little mottled with yellow.

1919. *Ionopsis*. So called by Mr. Kunth, from $\iota\sigma\sigma$, a violet, and $\sigma\upsilon\lambda\iota\varsigma$, resemblance. *I. utricularioides* is a pretty little epiphyte, with purplish falcate leaves. It succeeds ill under any management which has hitherto been applied to it.

1920. *Eulophia*. From $\epsilon\upsilon\lambda\omicron\phi\omicron\varsigma$, well crested, with reference to the surface of the middle lobe of the lip. The two species in the gardens are terrestrial tender stove plants, with bulbous roots, plaited leaves, and flowers, in *E. exaltata*, green and inconspicuous, in *E. guineensis*, whitish pink, and very handsome. They should be treated like *Cymbidium*.

History, Use, Propagation, Culture,

1921. *Angræcum*. A latinized form of the Malay appellation *angrec*, which is bestowed upon all epiphytous plants. This is a pretty genus, remarkable for the distinct spur to the lip. *A. maculatum* has handsome flat fleshy spotted leaves, and varies with flowers of a delicate pink and of a pale green color. *A. luridum* is an exceedingly rare species, with plaited leaves and conical bulbs covered with the vestiges of former leaves. *A. falcatum* is a little Japanese plant, whose flower has a spur nearly as long as the plant itself. It is easily grown among loose moss in a warm damp place, but there should always be some bits of rotten wood mixed among the moss for the tender roots to adhere to.

1922. *Aerantes*. A word with the same meaning as *Aerides*. Fine Madagascar plants. *A. sesquipedalis*, which has not yet blossomed, bears in its own country very large white flowers, with a spur a foot and half in length. The species are not caulescent as in *Aerides*, and the flowers appear singly, or two or three together; not in long racemes.

1923. *Calanthe*. From *καλος*, beautiful, and *ανθος*, a flower. The genus consists of robust terrestrial, not epiphytous, plants, with long plaited leaves, and fine white flowers, remarkable for the curious conformation of the labellum. They are easily cultivated as *Cymbidium*.

1924. *Stelis*. This was the Greek name of some parasitical plant found growing upon trees. The modern genus consists of little inconspicuous West Indian plants, with solitary leaves, and minute green flowers disposed in long filiform axillary spikes. They are not very easily managed; the best mode of cultivation is to plant them in very rotten wood with a little moss about them, and to keep them in a hot damp stove.

1925. *Malaxis*. From *μαλαξίς*, softness, in allusion to the delicate texture of the genuine species. They are natives of moist places in marshes, and are scarcely capable of successful cultivation.

1926. *Prescotia*. So called by Lindley in compliment to his friend John Prescott, Esq., an English gentleman resident at St. Petersburg, and highly distinguished for his botanical acquisitions. A curious little plant, with long spikes of green flowers. It is easily cultivated in peat and sand.

1927. *Microstylis*. From *μικρος*, little, and *στυλος*, a column, on account of the minuteness of the column. Little bog plants, resembling *Malaxis* in habit and manner of growth.

1928. *Liparis*. Probably derived from *λιπαρος*, unctuous, in allusion to the surface of the leaves of the original species, *L. Lœselii*. This genus consists of plants varying somewhat in habit, but agreeing in having pale green or greenish purple flowers, in terminal spikes or racemes. Part of the species are terrestrial, requiring the treatment of *Malaxis*; the remainder are epiphytes.

1929. *Calypso*. A poetical name, from *καλυπτω*, to conceal; not merely alluding to the covering of the stigma, but preserving an analogy between this botanical beauty, so difficult of access, and the secluded goddess, whose isle was fabled to be protected miraculously from the observation of navigators.

1930. *Vanilla*. An alteration of *vainilla*, which is a diminutive of *vaina*, a Spanish word, signifying a sheath. The fruit is a long cylindrical pod, very like the sheath of a knife. *Vanilla aromatica* produces the fruit of that name, which is used in England to flavor chocolate, and in Spanish America for that purpose, for perfuming snuffs, and as a medicine. The Spaniards have three different sorts, which they distinguish in com-

- 12978 Leaves lanceolate spotted flat entire
 12979 Leaves somewhat radical ensiform channelled falcate, Scares few-fl. Spur filiform very long
 12980 Stem compr. sheathing panicled, Branches quite simple spreading, Lip 3-lobed, Spur inflex. blunt emarg.
 12981 Leaves 2-lobed and very unequal at end shorter than the weak radical sheathed scape, Spur emarginate
 12982 Spur very long filiform, Spikes sheathed axillary
 12983 Leaves lanc. plaited nerved, Spike dense many-flowered, Bractes small lanceolate
 12984 Stem 1-leaved, Leaves oblong lanceolate the same length as raceme, Flowers 3-cornered
 12985 Stem long 1-leaved, Leaf broad-lanceolate shorter than raceme, Flowers 6-cornered
 12986 Lvs. about 4 at the base of the stem scabrous at the extremity, Scape pentagonal, Lip concave acute
 12987 Leaves oblong caesious flat nerved, Flowers in a long dense spike
 12988 Scape 1-leaved, Leaf amplexicaul. Lip truncate emarginate
 12989 Lvs. twin ovate-lanc. Scape 3-cornered, Inner sepals reflexed discolored, Lip concave obov. acute at end
 12990 Leaves twin ovate-lanceolate, Scape 3-cornered, Lip ovate at end recurved
 12991 Somewhat bulbous, Leaves 3-ovate plaited striated wavy, Lip reflexed with two tubercles at base
 12992 Radical leaves unequal lanceolate entire acute fleshy about the same length as raceme, Lip oblong retuse
 12993 Leaves lanceolate ensiform keeled, Raceme many-flowered, Lip 3-toothed at end
 12994 Lip narr. at base somew. clawed, Spur $\frac{1}{2}$ -bifid long. than lip with acute teeth, Pedunc. longer than ovary
 12995 Leaves ovate oblong nerved, Sepals wavy, Lip acute, Caps. cylindrical very long
 12996 Leaves oblong lanceolate flat obsolete striated, Lip retuse

and Miscellaneous Particulars.

merce, viz.; the *pompona*, the *ley*, and the *simarona*. When the fruit begins to turn yellow, it is gathered and fermented in small heaps, in the same manner as is practised with the cocoa or chocolate pods (*Theobroma*); it is then spread in the sun to dry, and when about half dried, pressed flat with the hand and rubbed over with the oil of Palma Christi, or of the cocoa; it is then exposed to the sun to dry, the oiling repeated, and the pods covered with the leaves of the Indian reed to preserve them. The fruits which are brought to Europe are of a dark brown color, about six inches long, and scarce an inch broad; they are wrinkled on the outside, and full of a vast number of black seeds, like grains of sand, of a pleasant smell, resembling Balsam of Peru.

The species of this genus, like many other *Epidendreae*, are falsely called parasitical; but are no more so than our *Polypodium vulgare*, which is often found growing on the trunks of old trees, especially pollards, rooted in the decaying bark. The *Vanillae* shoot out roots at every joint like the Ivy, and may be either grown on a piece of a rotten trunk of a tree, or planted in a pot of rotten tan mixed with rubbish, and the stem strained against any surface which it can root into. Like all the tribe, these plants require very little water.

Mr. Salisbury has the following observations upon *Vanilla planifolia*. "It was discovered by Father Plumier, in the island of St. Domingo, where it grows wild, climbing to the tops of the highest trees; and is easily preserved in our stoves, throwing out one or more roots at every leaf; but as it seldom flowers here, I would recommend the following treatment:—plant it at one end of a low bark stove, the temperature of which must be kept constantly hot and damp, never below sixty degrees of Fahrenheit in the night, during winter. Let the earth be fat loam, taken about an inch deep from the surface, in some old wood: mix this with a few decayed leaves and small pieces of rotten sticks, either in a tub bored full of holes, and sunk at the back corner of the bark pit; or pale off a space of two square feet for it, draining the bottom a foot in depth very effectually with hollow tiles and porous stones. Select a healthy young plant to place in this earth, and as soon as it pushes vigorously, divide the stem, by pinching off its top, into three or four principal branches, which train backwards and forwards over that end of the bark pit, at two inches and a half distance from each other, on stout rods of a rough-barked elm nailed firmly across; the roots which issue from the bottom of the stem or branches must be sufficed to penetrate into the earth, where they will swell and nourish the plants; but if those beyond attempt to strike downwards, wind them gently along the elm rods, to which they will soon cling by small fibres, like those of Ivy. When the principal branches have extended to fifteen or twenty feet in length, divide them again by pinching their tops, as you find it necessary, into about a dozen branches in all, which must be left to flower, guiding them first horizontally, and afterwards in every possible direction, upon smaller rods of rough-barked elm, stuck into the bark pit at various angles. From the twentieth of March to the twentieth of September, shade that end of the stove by the light foliage of a *Passiflora*, trained all over the top, but pruned so thin as to admit the rays of the sun to play on the bed underneath: I prefer this method to a mat, for many reasons. Let the earth be always damp by gentle sprinklings of water, but never very wet, except in the great heats of summer, when I should be inclined to give the plant two or three drenching showers all over from a fine-nosed watering-pot, shutting up the house at night full of steam."

History, Use, Propagation, Culture.

1931. *Cypripedium*. From *Κυπρις*, Venus, and *πῶδιον*, a slipper, in allusion to the elegant slipper-like form of the labellum. Handsome plants which will only thrive in a shady border in peat soil. The American species should be covered with some dry straw in very severe frosts, or if there should be too much wet; they are not easily increased, but will sometimes perfect seeds in favorable situations, particularly if pains be taken to apply the pollen to the stigma. (*Bot. Cult.* 358.)

1932. *Stylidium*. From *στυλος*, a column, in reference to the manner in which the stamen and style are united into one columnar mass. Beautiful little New Holland plants with pink flowers, remarkable for the singular elasticity of their column, which, being touched with a pin, starts with violence from the side to which it was turned when stimulated. The species grow in sandy loam and peat, and are increased by seeds, or dividing at the root; some of them by cuttings.

1933. *Gunnera*. So called after Ernest Gunner, bishop of Norway, who published a Flora of his country from 1766 to 1772. An uninteresting plant with orbicular leaves. May be planted in a pot of loam and peat, and thrived in water; it is increased by dividing at the root.

1934. *Aristolochia*. From *αἰσῖπος*, excellent, and *λαγός*, a female in child-birth; the plant was considered formerly to possess considerable powers in aiding the expulsion of the placenta, and in exciting the lochia

and Miscellaneous Particulars.

discharge. The root of *A. serpentaria* is said to be the substance which the Egyptian snake-jugglers chew, for the purpose of stupefying the snakes by the introduction of their saliva into the reptiles' mouths. *A. clematitis* (from *κλεματις*, a young shoot of the vine, in allusion to its appearance) is a species which furnishes one of the roots employed in European medicine. It is stimulant, stomachic, and emmenagogue; use has been made of it for various purposes, as for paleness of the countenance, fistula, sarcoma, &c. *A. pistoulchia* is also employed for the same purposes. It grows upon the dry stony places of Languedoc and Provence. It is used in cases of obstructed perspiration, and in disorders of the lungs. The roots should be chosen of a plump texture, and a yellowish color. They should be newly dried, and possess an aromatic flavor and a bitter taste.

Aristolochia trilobata and *odoratissima* have strong smelling roots, which are looked upon in Jamaica as powerful medicines, and used as stomachics by the slaves. The first species is called *Contraeryva* of the north side, from its growing in that part of the island; and the other *Contraeryva* of the south side, for a corresponding reason. The root of *A. serpentaria* retains a place in the *Materia Medica*. The dried root is imported into this country from North America; it has an aromatic odor, not unlike that of Valerian; and a sharp, warm, bitter, pungent taste, resembling in some degree that of camphor. Medicinally, it is stimulant, diaphoretic, and tonic.

CLASS XXI. — MONŒCIA.

Male and female organs in distinct flowers, but upon the same plant.

This class consists of a variety of plants of all kinds, natures, and affinities, combined by the character of having their flowers unisexual, but upon the same plant, in which respect Monœcia is distinguished from the next class, Dioecia. It contains nearly all the most important timber-trees of the temperate countries of the world, such as the oak, the pine, the birch, the beech, the walnut, the plane, the cypress, and many others. The bread-fruit, so important an article of food in some parts of the world, is placed in Monandria. Various palms occupy a station in other parts of the class. The dangerous Manchineel-tree, and many poisonous or medicinal plants, are also placed here. To Monœcia Polyandria belongs the famous Upas-tree of Java, to which so many fables are attached. It is described in Rumphius's Herbarium Amboinense (2. 87.), under the name of Ipo, and is now ascertained to be a species of Antiaris. From Siphonia elastica, a plant of Monœcia Monadelphica, and native of Brazil, one of the kinds of Caoutchouc or gum elastic of commerce is obtained.

Sprengel, and others, refer most of the genera of Monœcia to other classes, considering those only to be truly referable to it, of which the male and female flowers have some differences of structure.

Order 1. MONANDRIA.  Stamen 1.

1935. *Artocarpus*. Male. A cylindrical catkin. Cal. O. Petals 2. Filament the length of cor. Female. Cal. O. Cor. O. Ovaries numerous, collected in a globe. Style filiform. Drupe compound.

1936. *Casuarina*. Male. Catkin filiform. Calyx 2-valved. Cor. O. Female. Catkin globose. Calyx an ovate scale. Cor. O. Caps. 2-valved, 1-seeded. Seed winged at end.

1937. *Ceratocarpus*. Male. Cal. 2-parted. Cor. O. Filament long. Female. Calyx 1-leaved, 2-horned, attached to the superior ovary. Cor. O. Style 2. Seed 1, tightly enclosed in the calyx.

1938. *Zannichellia*. Barren fl. Perianth. none. Fertile fl. Perianth. single of 1 leaf. Germens 4 or more. Style 1. Stigma peltate. Capsules sessile.

Order 2. DIANDRIA.  Stamens 2

1939. *Lemna*. Male. Cal. 1-leaved. Cor. O. Female. Calyx 1-leaved. Cor. O. Style 1. Capsule 1-celled, 2-seeded.

1940. *Anguria*. Male. Calyx 5-fid. Petals 5. Female. Cal. 5-fid. Petals 5. Fruit inferior, 2-celled, many-seeded.

Order 3. TRIANDRIA.  Stamens 3.

1941. *Comptonia*. Male. A catkin. Calyx a scale. Petals 2. Filaments 2-forked. Female. A catkin. Calyx a scale. Petals 6. Styles 2. Nut ovate.

1942. *Hernandia*. Male. Calyx 3-parted. Petals 3. Female. Calyx truncate, entire. Petals 6. Drupe hollow, open at orifice, with a moveable kernel.

1943. *Ayria*. Male. Calyx 3-parted. Cor. O. Female. Calyx 5-leaved. Cor. O. Styles 2. Seed 1.

1944. *Tragia*. Male. Calyx 3-parted. Cor. O. Female. Calyx 5-parted. Cor. O. Style 3-fid. Caps. of 3 pieces, and 3 cells. Seed solitary.

1945. *Typha*. Flowers collected into cylindrical dense spikes or catkins. Barren fl. Perianth. O. Stam. 3 together, upon a chaffy or hairy receptacle, united below into 1 filament. Fertile fl. Perianth. O. Pericarp pedicellate, surrounded at the base with hairs resembling a pappus.

1946. *Sparanium*. Flowers in spherical dense heads. Barren fl. Perianth single, of 3 leaves. Fertile fl. single, of 3 leaves. Drupe dry, with 1 seed.

1947. *Carex*. Flowers collected into an imbricated catkin. Barren fl. Calyx of 1 scale, glumaceous. Cor. O. Fertile fl. Calyx of 1 leaf, glumaceous. Cor. of 1 leaf, urceolate, ventricose. Stigm. 2-3. Nut triquetrous, included within the persistent cor.

1948. *Cobresia*. Flowers in an imbricated catkin. Male. Calyx a solitary scale. Cor. O. Female. Cal. generally a double scale; one flat, the other involving the ovary. Cor. O. Stigmas 3. Nut somewhat three-cornered, naked.

1949. *Uncinia*. Flowers in an imbricated catkin, androgynous. Male. Cal. a solitary beardless scale. Female. Cal. bearded; beard hooked from the base of the inside of scale. Stigmas 3.

1950. *Zea*. Male in distinct spikes. Cal. a two-flowered blunt glume. Cor. a blunt glume. Female. Cal. a 2-valved glume. Cor. a 2-valved glume. Style 1, filiform, pendulous. Seeds solitary, immersed in an oblong receptacle.

1951. *Coix*. Male in remote spikes. Cal. a 2-flowered blunt glume. Cor. a blunt glume. Female. Calyx a 2-flowered glume. Cor. a blunt glume. Style 2-parted. Seed covered by the ossified calyx.

1952. *Tripsacum*. Male. Glume 2-flowered: outer male; inner neuter. Cor. a membranous glume. Female. Calyx a 1-fl. glume, surrounded by a 1-leaved involucre, perforated at the recesses. Cor. a 2-valved glume. Styles 2. Seed 1.

1953. *Heteropogon*. Spike simple, monœcious. Flowers male on one side, female on the other. Male. Cal. 2-valved. Cor. 2-valved, beardless: the inner valve setaceous. Nectary 2-lobed, turgid. Female. Cal. 2-valved. Cor. 2-valved, one thickish and bearded. Beard very long and hairy.

1954. *Olyra*. Male. Calyx a 1-flowered somewhat awned glume. Cor. O. Female. Cal. a 1-fl. spreading, ovate, awned glume. Cor. a 2-valved blunt glume. Style bifid. Seed cartilaginous.

Order 4. TETRANDRIA.  Stamens 4.

1955. *Alnus*. Flowers collected into imbricated catkins. Barren fl. Scale of the catkin 3-lobed, with three flowers. Perianth. single, 4-partite. Fertile fl. Scale of the catkin subtrifid, with 2 flowers. Perianth. O. Style 2. Fruit compressed.

1956. *Betula*. Barren flower in a cylindrical catkin, its scales 3-fl. Perianth. O. Stam. 10-12. Fertile fl. Scale of the catkin imperfectly 3-lobed, 3-flowered. Perianth. O. Styles 2. Germens compressed, 2-celled, one abortive. Nuts compressed, with a membranaceous margin, 1-seeded.

1957. *Burus*. Male. Calyx 3-leaved. Petals 2. Rudiment of an ovary. Female. Calyx 4-leaved. Petals 3. Styles 3. Caps. with 3 beaks and 3 cells. Seeds 2.
1958. *Cicca*. Male. Calyx 4-leaved. Cor. O. Female. Cal. 4-leaved. Cor. O. Styles 4. Capsule 4-coccos, not splitting, somewhat fleshy.
1959. *Morus*. Male. Cal. 4-parted. Cor. O. Female. Calyx 4-leaved. Cor. O. Styles 2. Calyx berried. Seed 1.
1960. *Bahmeria*. Male. Cal. 4-parted. Cor. O. Nut O. Female. Cal. O. Cor. O. Style 1. Seed 1.
1961. *Pilea*. Male. Cal. 4-parted membranous. Stamens 4 elastic. Female. Calyx 3-leaved, with one sepal fleshy and gibbous. Stigma sessile fringed.
1962. *Urtica*. Barren fl. Perianth. single, of 4 leaves, containing the cup-shaped rudiment of a germen. Fertile fl. Perianth. single, of 2 leaves. Pericarp 1-seeded, shining.
1963. *Pachysandra*. Male. Calyx 4-leaved. Cor. O. Female. Calyx 4-leaved. Cor. O. Styles 3. Caps. 3-horned, 3-celled. Seeds 2.
1964. *Diotis*. Male. Calyx 4-leaved. Cor. O. Female. Calyx 1-leaved, 2-horned. Style 2-parted. Seed 1, villous at base, covered with the 2-horned calyx.
1965. *Empicurum*. Male. Calyx 4-fid. Cor. O. Female. Cal. 4-fid, inferior. Cor. O. Stigma cylindrical, seated on a lateral tooth of the ovary. Caps. splitting at side. Seed 1, with an arillus.
1966. *Aucuba*. Male. Cal. 4-toothed. Petals 4. Recept. with a square hole. Female. Cal. 4-toothed. Petals 4. Ovary inferior. Style 1, short. Nut ovate, 1-celled.
1967. *Littorella*. Barren fl. Calyx of 4 leaves. Cor. 4-fid. Stam. very long. Fertile fl. Calyx O. Cor. unequally 3-cleft. Style very long. Nut 1.
1968. *Serpicula*. Male. Cal. 4-toothed. Petals 4. Female. Cal. 4-parted. Pericarp a downy nut.
1969. *Maclura*. Male. A catkin. Female. Cal. O. Corolla O. Style 1, filiform, villous. Ovaries numerous, coalescing into a compound globose berry of many cells; cells 1-seeded. Seed obovate, compressed.

Order 5. PENTANDRIA.

Stamens 5.

1970. *Exocarpus*. Male. Cal. 5-leaved. Cor. O. Stamens inserted in calyx. Female. Style simple, short. Stigma peltate. Drupe 1-seeded, placed on a fleshy receptacle.
1971. *Nephetium*. Male. Cal. 5-toothed. Cor. O. Female. Cal. 4-fid. Cor. O. Ovaries 2. Styles two to each. Drupe 2, dry, mucricated, 1-seeded.
1972. *Schizandra*. Male. Cal. 9-leaved in a triple row. Cor. O. Anthers subsessile, cohering at end. Female. Cal. of male. Cor. O. Ovaries numerous, capitate. Berries 1-seeded, inserted on a long filiform receptacle.
1973. *Franzeria*. Male. Cal. common, 1-leaved, many-toothed. Cor. 1-petalous, tubular, 5-toothed. Recept. naked. Female. Calyx many-leaved. Cor. O. Styles 4. Drupe dry, 4-celled, setose.
1974. *Xanthium*. Male. Common calyx imbricated. Cor. monopetalous, 5-fid, funnel-shaped. Female. Cal. a 2-leaved, 1-flowered involucre. Cor. O. Drupe dry, mucricated, 2-fid. Nut 2-celled.
1975. *Amaranthus*. Male. Cal. 3-5-leaved. Cor. O. Stamens 3-5. Female. Cal. of the male. Cor. O. Styles 3. Caps. 1-celled, cut round about.
1976. *Luffa*. Male. Cal. 5-parted. Cor. 5-parted, attached to calyx. Female. Cal. and cor. of male. Filaments 5, sterile. Ovary inferior. Stigma clavate. Gourd with a lid, 3-celled, furrowed.
1977. *Ambrosia*. Male. Common cal. 1-leaved. Cor. 1-petalous, 5-fid, funnel-shaped. Recept. naked. Female. Cal. 1-leaved, entire, 5-toothed beneath, 1-flowered. Cor. O. Nut formed by the indurated calyx, 1-seeded.
1978. *Securinega*. Male. Cal. 5-parted. Cor. O. Stamens 5, inserted under a rudiment of a pistillum. Female. Capsule 3-celled.

Order 6. HEXANDRIA.

Stamens 6.

1979. *Zizania*. Male. Cal. O. Cor. a 2-valved blunt glume, mixed with the females. Female. Cal. O. Cor. a 2-valved glume, cucullate, and awned. Style 2-parted. Seed 1, enveloped in the plaited corolla.
1980. *Pharus*. Male. Cal. a 2-valved 1-fl. glume. Cor. a 2-valved glume. Female. The cal. of the male. Cor. a long involute 2-valved glume. Seed 1.
1981. *Guetarda*. Male. Cal. cylindrical. Cor. 4-7-fid, funnel-shaped. Female. Cal. cylindrical. Cor. 4-7-fid. Ovary 1. Drupe dry.
1982. *Sagus*. Common spatha 1-valved. Spadix branched. Male. Cal. 3-leaved. Cor. O. Filam. dilated. Female. Cal. 3-leaved, with two of the leaves bifid. Cor. O. Style very short. Stigma simple. Nut tessellated-imbricated, 1-seeded.
1983. *Cocos*. Common spatha 1-valved. Spadix branched. Male. Cal. 3-leaved. Cor. 3 petals. Female. Cal. 2-leaved. Cor. 6 petals. Style O. Stigma a depression. Drupe fibrous.
1984. *Elate*. Common spatha 2-valved. Spadix branched. Male. Cal. 3-toothed. Petals 3. Anthers sessile. Female. Cal. 3-toothed. Petals 3. Stigmas 3. A drupe.
1985. *Bactris*. Common spatha 1-valved. Spadix branched. Male. Cal. 3-parted. Cor. 3-fid. Female. Cal. 3-toothed. Cor. 3-toothed. Style very short. Stigma capitate. Drupe fibrous, succulent.

Order 7. POLYANDRIA.

Stamens more than 6.

1986. *Ceratophyllum*. Barren fl. Cal. multipartite. Cor. O. Stam. 16-20. Fertile fl. Cal. multipartite. Cor. O. Stigma nearly sessile, oblique. Nut 1-seeded.
1987. *Miophyllum*. Barren fl. Cal. of 4 leaves. Petals 4. Stamens 8. Fertile fl. Cal. of 4 leaves. Petals 4. Stigmas 4, sessile. Nuts 4, subglobose, 1-seeded.
1988. *Sagittaria*. Male. Cal. 3-leaved. Petals 3. Stamens about 24. Female. Cal. 3-leaved. Petals 3. Ovaries many. Seeds many, naked.
1989. *Egonia*. Male. Cal. O. Petals 4: the two opposite the largest. Stamens numerous. Female. Cal. O. Petals 4 or 6, like the male. Styles 3, bifid. Caps. inferior, 3-angular winged, 3-celled, many-seeded.
1990. *Potterium*. Barren fl. Cal. of 4 leaves. Cor. 4-partite. Stamens 30-40. Fertile fl. Cal. of 4 leaves. Cor. 4-partite. Germens 2. Fruit 2-celled, invested with the cal.
1991. *Amirola*. Male. Calyx 5-fid: lower segm. cut down to the base. Cor. O. Stamens 8, declinate. Female as in the male. Style incurved. Caps. 3-coccos, inflated, 3-valved. Seeds globose.
1992. *Acidolon*. Male. Cal. 5-leaved. Cor. O. Stamens 33-40. Female. Cal. 6-leaved. Cor. O. Style 3-fid. Caps. 3-coccos.
1993. *Thelygonum*. Male. Cal. 2-fid. Cor. O. Stamens about 12. Female. Cal. 2-fid. Cor. O. Ovary 1. Caps. coriaceous, 1-celled, 1-seeded.
1994. *Castanea*. Barren fl. in a very long cylindrical catkin. Perianth. single, of 1-leaf, 6-cleft. Stamen 5-20. Fertile fl. 3, within a 4-lobed, thickly mucricated involucre. Perianth. single, urceolate, 5-6-lobed, having the rudiments of 12 stamens. Germen incorp. with the perianth. 6-celled, with the cells 2-seeded, 5 of them mostly abortive. Styles 6. Nut 1-2-seeded, invested with the enlarged involucre.

1995. *Ostrya*. Male, an imbricated catkin. Cal. a scale. Cor. O. Filaments branched, Female, a naked catkin. Cal. O. Cor. O. Caps. inflated, imbricated, 1-seeded at base.
1996. *Carpinus*. Barren fl. in a cylindrical catkin, its scales roundish ciliated at the base. Stamens 8-20. Fertile fl. in a lax catkin, its scales large, foliaceous, 3-lobed, 1-flowered. Invol. O. Perianth. of 1 leaf, urceolate, 6-dentate, incorporated with the 2-celled germen, of which 1 cell is abortive. Styles 2. Nut ovate, striated, 1-seeded.
1997. *Fagus*. Barren fl. in a globose catkin. Perianth. single, of 1 leaf, campanulate, 6-cleft. Stamens 5-12. Fertile fl. within a 4-lobed prickly involucre. Perianth. single, urceolate, with 4-5 minute lobes. Germen incorporated with the perianth, 3-celled, two of them becoming abortive. Styles 3. Nuts 1-seeded, invested with the enlarged involucre.
1998. *Corylus*. Barren fl. in a cylindrical catkin, its scales 3-cleft. Perianth. O. Stamens 8. Anthers 1-celled. Fertile fl. Perianth. obsolete. GERMENS several, surrounded by a scaly involucre. Stigmas 2. Nut 1-seeded, surrounded at the base with the enlarged united coriaceous scales of the involucre.
1999. *Juglans*. Male, an imbricated catkin. Cal. a scale. Cor. 6-parted. Filaments 4-18. Female. Cal. 4-fid, superior. Cor. 4-fid. Styles 2. Drupe coriaceous, with a furrowed nut.
2000. *Quercus*. Barren fl. in a lax catkin. Perianth. single, somewhat 5-cleft. Stamens 5-10. Fertile fl. invol. cup-shaped, scaly. Perianth. single, incorporated with the germen, 6-lobed. Germen 3-celled, 2 of them abortive. Style 1. Stigmas 3. Nut (acorn) 1-celled, 1-seeded, surrounded at the base by the enlarged cup-shaped involucre.
2001. *Liquidambar*. Male, a conical catkin, surrounded by a 4-leaved involucre. Cal. O. Cor. O. Filaments numerous. Female, a globose catkin, surrounded by a 4-leaved involucre. Cal. 1-leaved, urceolate, 2-flowered. Cor. O. Styles 2. Capsules 2, surrounded at base by calyx, 1-celled, many-seeded.
2002. *Platanus*. Male, a globose catkin. Cal. O. Cor. scarcely any. Anthers growing about the filament. Female, a globose catkin. Cal. many-leaved. Cor. O. Styles with a recurved stigma. Seeds roundish, mucronate with the style, papose at base.
2003. *Salisburia*. Male, a naked catkin. Cal. O. Cor. O. Anthers imbricated. Female. Cal. 4-fid. Drupe with a 3-cornered nut.
2004. *Carludovica*. Common spatha 4-leaved. Spadix cylindrical. Male. Common calyx a cubical 4-flowered receptacle: proper calyx many-toothed. Female. Cal. an edge. Styles 4, very long. Stigmas anther-like. Berry cubical, many-seeded.
2005. *Catadium*. Male. Cal. and cor. O. Anthers peltate, many-celled, disposed in a spike at the end of the spadix. Female. Cal. and cor. O. Ovaries inserted at base of spadix. Style O. Berry 1-celled, many-seeded.
2006. *Arum*. Spatha of 1 leaf, convolute at the base. Perianth. O. Spadix with germen at the base. Stem (sessile) near the middle of the spadix, which is naked above. Berry 1-celled, 1-seeded.
2007. *Caryota*. Common spatha compound. Male. Cal. 3-leaved. Petals 3. Female. Cal. 3-leaved. Cor. 3-parted. Style 1. Berry 1-celled, 2-seeded.

Order 8. MONADELPHIA.

Stamens united into a single body.

2008. *Nipa*. Palm. Male. Cal. O. Petals 6. Filament 1, 12-fid. Female. Stigma a lateral furrow. Drupe angular, 1-seeded.
2009. *Aveca*. Common spatha 2-valved. Male. Cal. 3-parted. Petals 3. Stamens 6, cohering at base. Female. Cal. 3-leaved. Petals 3. Nect. 6-toothed. Styles 3, very short. Drupe 1-seeded.
2010. *Betis*. Male. Anthers 2-celled. Female. Scales imbricated in a lupuliform cone, very short, crested, bracteate at back, trigynous. Lateral pericarps auricled, middle cuneate, deciduous with the cone.
2011. *Agathis*. Male. Anthers many-celled. Female. Scales imbricated in a round cone, naked at back, persistent monogynous. Pericarps winged, united to the inside of scale. Cotyledons 2.
2012. *Pinus*. Male. Anthers 2-celled. Female. Scales in a conical cone, bracteate at base, digynous. Pericarps attached to the inside of scale, more or less winged, deciduous. Stigmas 2-3-fid. Cotyledons 4-8.
2013. *Abies*. The same as *Larix*, excepting its habit and stigma, which is that of *Pinus*. Cotyledons 3-9.
2014. *Larix*. Male. Anthers 2-celled. Female. Scales imbricated in a round cone, bracteate at base, digynous. Pericarps attached to inside of scale, winged, deciduous. Stigma hemispherical, cupped, glandular. Cotyledons 5-9.

*History, Use, Propagation, Culture,*

1935. *Artocarpus*. From *αερος*, bread, and *καερος*, fruit, in allusion to the well-known name and uses of the bread-fruit. *Rime* or *Fruit-à-pain*, Fr., *Brodbaum*, Ger., and *Albero di pane*, Ital. *A. incisa* grows in the South Sea Islands to the size of a moderate sized oak, with alternate leaves, deeply gashed, glaucous, and two feet long. The whole tree and the fruit before it is ripe, abound in a very tenacious milky juice. The fruit is about the

2015. *Schubertia*.

2016. *Podocarpus*. Male. Cal. leaflets of the bud imbricated. Anthers many, adnate, bilocular, rostrate, fixed to the lengthened column of the filament. Female. An ovate 1-celled nut, half immersed in a firm receptacle.

2017. *Cupressus*. Male, an imbricated catkin. Cal. a scale. Cor. O. Anthers 4, sessile, without filaments. Female, a cone-like catkin. Cal. a l.f. scale. Cor. O. Stigma 2 concave dots. Nut angular.

2018. *Thuja*. Male, an imbricated catkin. Cal. a scale. Pet. 4. Anthers 4. Female, a cone-like catkin. Cal. a 2-f. scale. Cor. O. Nut 1, surrounded by an edged wing.

2019. *Trichosanthes*. Male. Cal. 5-toothed. Cor. 5-parted, ciliated. Filaments 3. Female. Cal. 5-toothed. Cor. 5-parted, ciliated. Style 3-fid. Gourd oblong.

2020. *Momordica*. Male. Cal. 5-fid. Cor. 5-parted. Filaments 3. Female. Cal. 5-fid. Cor. 5-parted. Style 3-fid. Gourd dropping off with elasticity.

2021. *Cucurbita*. Male. Cal. 5-toothed. Cor. 5-fid. Filaments 3. Female. Cal. 5-toothed. Cor. 5-fid. Ovary 3-fid. Seeds of gourd with a tumid edge.

2022. *Cucumis*. Male. Cal. 5-toothed. Cor. 5-parted. Filaments 3. Female. Cal. 5-toothed. Cor. 5-parted. Ovary 3-fid. Seeds of gourd with a sharp edge.

2023. *Sicyos*. Male. Cal. 5-toothed. Cor. 5-parted. Filaments 3. Female. Cal. 5-toothed. Cor. 5-parted. Style 3-fid. Gourd 1-seeded.

2024. *Bryonia*. Barren fl. Cal. 5, dentate. Cor. 5-cleft. Filaments 3. Anthers 5. Fertile fl. Calyx 5-dentate. Cor. 5-cleft. Style trifid. Berry inferior, globose, many-seeded.

2025. *Andrachne*. Male. Cal. 5-leaved. Petals 5. Stamens 5, inserted into the rudiment of a style. Female. Cal. 5-leaved. Cor. O. Styles 3. Caps. 3-celled. Seeds 2.

2026. *Stillingia*. Male. Cal. hemispherical, many-fl. Cor. tubular, crocd. Female. Cal. 1-flowered, inferior. Cor. superior. Style 3-fid. Caps. 3-coccous.

2027. *Phyllanthus*. Male. Cal. 6-parted. Cor. O. Filament columnar. Anthers 3. Female. Cal. 6-parted. Cor. O. Disk with 12 angles. Styles 3. Capsule 3-coccous.

2028. *Aleurites*. Male. Cal. 3-fid. Petals 5. Scales 5. Filament columnar. Anthers numerous. Female. Cal. 3-fid. Petals 5. Scales 5. Style O. Stigmas 2. Berry dicoccous.

2029. *Omphalca*. Male. Cal. 4-parted. Cor. O. Disk a fleshy ring. Filament columnar. Anthers 2-5. Female. Cal. 4-parted. Cor. O. Style very short. Stigma trifid. Caps. 3-coccous, 3-celled: cells with a solitary nut.

2030. *Hippomane*. Male. Cal. campanulate, emarginate. Cor. O. Filament columnar. Female. Cal. 3-leaved. Cor. O. Style very short. Stigma 7-fid. Drupe with a 7-celled nut.

2031. *Sapium*. Male. Cal. 2-fid. Cor. O. Filament 2-fid. Female. Cal. 3-toothed. Cor. O. Style very short. Stigma 3-fid. Caps. 3-coccous.

2032. *Croton*. Male. Cal. cylindrical, 5-toothed. Petals 5. Stamens 10-15. Female. Cal. many-leaved. Cor. O. Styles 3, bifid. Caps. 3-celled. Seed 1.

2033. *Jatropha*. Male. Cal. O, or 5-leaved. Cor. monopetalous, funnel-shaped. Stamens 10, alternately shorter. Female. Cal. O. Cor. 5-petalous, spreading. Styles 3, bind. Caps. 3-celled. Seed 1.

2034. *Ricinus*. Male. Cal. 5-parted. Cor. O. Stamens numerous. Female. Cal. 3-parted. Cor. O. Styles 3, bifid. Capsule 3-celled. Seed 1.

2035. *Hura*. Male. An imbricated catkin. Perianth truncate, 2-leaved. Cor. O. Filament cylindrical, peltate at end, surrounded by many double anthers. Female. Cal. cylindrical. Cor. O. Style funnel-shaped. Stigma 12-fid. Caps. 12-celled. Seed 1.

2036. *Sterculia*. Male. Cal. 5-parted. Cor. O. Filament columnar, surmounted by numerous anthers. Female. Cal. 5-parted. Cor. O. Anthers sterile, surrounding the base of the stalked ovaries. Follicles 5, many-seeded.

2037. *Heisteria*. Male. Cal. 5-toothed. Cor. O. Filament columnar, surmounted below the end with anthers. Female. Cal. 5-toothed. Cor. O. Sterile anthers at base of ovaries. Drupes 5, dry, 1-seeded.

2038. *Acalypha*. Male. Cal. 3-4-leaved. Cor. O. Stamens 8-16. Female. Cal. 3-leaved. Cor. O. Styles 3. Caps. 3-coccous, 3-celled. Seed 1.

2039. *Dalechampia*. Common involucre outside, with 4 leaflets: inside with 2, trifid. Male. Umbel 10-fl.; with a 2-leaved involucre and numerous paleae. Cal. 5-leaved. Cor. O. Filaments many, connate. Female. Florets 3, with a 3-leaved involucre. Cal. 11-leaved. Cor. O. Style filiform. Caps. 3-coccous.

2040. *Plukenetia*. Male. Cal. 4-parted. Cor. O. Stamens 20. Female. Cal. 4-parted. Cor. O. Style very long, with a peltate 4-lobed stigma. Caps. 4-coccous.

History, Use, Propagation, Culture,

resembling that of the crumb of wheat bread mixed with Jerusalem Artichoke. The plant was first brought to England by the unfortunate Captain Bligh. A fresh supply has been more than once received, and there are now a number of plants in the nurseries about London. The bread-fruit, according to Sweet, is generally supposed to be difficult of cultivation in this country. He considers that the plants have been, in general, treated too tenderly, and not allowed sufficient air. "They appear," he says, "to be of the same nature as the Fig, to which they are nearly allied. Large cuttings root freely in a pot of sand, plunged under a hand-glass, in a moist heat, with all their leaves entire: if the leaves are shortened, it is a great chance if they succeed." (*Bot. Cult.* 19.)

There are several varieties of the bread-fruit, as of all plants that have been long in cultivation. The principal of these varieties are without seeds; the natives of Otaheite reckon at least eight, differing in the form of the leaf and fruit. A. integrifolia is also by many considered a variety of the other; for the leaves are sometimes lobed, and the situation of the fruit varies with the age of the tree, being first borne on the branches, then on the trunk, and finally on the roots.

The bread-fruit is ripe in December, and is used boiled, or fried in Palm oil. Besides the use of the fruit, the economical purposes to which the other parts of the tree are applied are various. The wood is used in building boats and houses; a cloth is made of the inner bark; the male catkins serve for tinder; the leaves for wrapping up food, and for wiping the hands instead of towels; and the juice for making bird-lime, and a cement for filling up the cracks of vessels for holding water. According to Forster, three trees are supposed to yield sufficient nourishment for one person.

The bread-fruit tree is distributed very extensively over the East Indian continent and islands, as well as the innumerable islands of the South Seas. In 1793 it was introduced to the West Indies, and subsequently to different parts of South America. Much has been said in praise of it by Europeans, and certainly, to the inhabitants of the South Sea Islands, it may be a valuable food, as the acorn was to the inhabitants of Britain, when they were in a certain state of civilization. But whether a civilized and refined people would esteem this fruit for their own use as highly as they do for the use of the semi-barbarians of the South Seas, is a point which may reasonably be doubted.

1936. *Casuarina*. The name under which the tree is described by Rumphius, who probably called it so from the resemblance its foliage bears to the plumage of the *casoar* or *casowary* of the same country. By the Malays it is called *fitao*, and by the South Sea Islanders *club-wood*, on account of the use of it for warlike weapons. *Casuarina equisetifolia* is a large spreading and lofty tree, with leaves, or rather branchlets, hanging down in bunches from twelve to eighteen inches in length, like a long head of hair, or a horse's tail, all jointed from top to bottom. The appearance of the whole tree is very remarkable. It was introduced by the first Lord Byron.

- 13034 Branchlets flaccid round, Scales of cones unarmed villous
 13035 Dioecious, Branchlets erect furrowed, Scales of cones unarmed smoothish
 13036 Dioecious, Branchlets ovate round, Scales of cones unarmed ciliated
 13037 Dioecious, Branchlets flaccid, Scales of cones villous and rough with tubercles
 13038 Dioecious, Young branches somewhat flaccid, Scales of cones villous, Male sheaths submultifid ciliated
 13039 Branches erect, Scales of cones mucronate pubescent, in which it chiefly differs from *C. stricta*
 13040 Monoecious, Branchlets erect square, Scales of cones unarmed smooth

13041 Stem much branched diffuse making globose tufts

13042 Anthers 4-celled, Stigmas entire, Pericarp toothed on the back

DIANDRIA.

13043 Fronds thin elliptical-lanceolate caudate at one extremity, at the other serrate, Roots solitary

13044 Fronds nearly ovate compressed, Roots solitary

13045 Fronds obovate nearly plane above hemispherical beneath, Roots solitary

13046 Fronds obovate rotundate compressed, Roots numerous clustered

13047 Fruit small, Leaves 3-lobed

TRIANDRIA.

13048 Leaves oblong alternately sinuated

13049 Leaves peltate

13050 Leaves cordate ovate acuminate flat stalked at base

13051 Leaves ovate, Stem erect, Spikes simple

13052 Leaves ovate, Stem erect, Spikes paniced

13053 Leaves obovate, Stem somewhat divided, Flowers capitate

ana Miscellaneous Particulars.

1907. *Ceratocarpus*. Named from *κερας*, a horn, and *καρπος*, fruit, because the seeds have two horns. Useless weeds.

1908. *Zannichellia*. So called in honor of John Jerome Zannichella, a Venetian apothecary, who died in 1729. He left behind him a few works of little consequence. A plant found abundantly in the marshes of some parts of England.

1909. *Lemna*. Said to have been so called from *λεπτις*, a scale, in allusion to the form of the plants. Theophrastus describes under the same name an aquatic plant. Annual weeds, which float on stagnant water, their flowers are very obscure, and not produced freely in northern climates. *L. trisulca* has dichotomous, filiform, divaricated stems, having a lanceolate leaf at the angle of the branches, but proliferous ones terminating the branches; where these leaves are conjoined, there shoots out a pendant radicle, with a conical papilla at its base. Linnaeus observes, that the stems are flattened and proliferous, crossing each other, and thus resembling in the mode of growth the opuntia or Indian fig. The leaves of *L. minor* are very small, of a roundish ovate form, collected into heaps by twos or threes, and forming extensive green mats on stagnant waters; each leaf drops a single radicle. This plant affords nourishment not only to ducks, but to the fresh water polype, to *Phalena Lemnata*, &c. Its quick and extensive propagation makes it troublesome in some cases, but at the same time it is considered valuable as converting hydrogen gas into air adapted to respiration. *L. polyrhiza* is distinguished by its dropping bundles of thick black fibres from the lower surface of the leaves. The plants sink in the water in the winter season, and either these or new ones appear again in the spring.

1940. *Anguria*. One of the Greek names for the Cucumber. The plant now so called is also a kind of gourd. The species grow freely on light soil, and are propagated by seeds or roots.

1941. *Comptonia*. Named in honor of Henry Compton, Lord Bishop of London, by whom the fine collection of plants attached to the episcopal palace at Fulham was formed. A handsome shrub, which thrives in peat soil, or sandy loam, and is increased by suckers or layers.

1942. *Hernandia*. So called in honor of Francisco Hernandez, a Spanish botanist, and first physician to Philip the second of Spain, by whom he was sent to Mexico for the sake of investigating the natural history of that country. Linnaeus is said to have named it in allusion to the large leaves and little flowers of the plant, which may be supposed to represent the great means and small advantages which attended the expedition of Hernandez. This is an upright lofty tree, with an elegant head. The fruit is a nut, sustained and partly enveloped by a yellow persisting calyx. The nuts are very large, and as they move in the wind, produce sound enough to alarm unwary travellers. In our stoves the plants grow freely in loamy soil, and ripened cuttings, with their leaves on, root in sand under a hand-glass.

1943. *Azyris*. A word of unknown meaning. Plants of little beauty and the easiest culture.

History, Use, Propagation, Culture,

1944. *Tragia*. In honor of a German botanist named Jerome Bock, born in 1498, and died in 1554; *Tragus*, which was the name he bore in science, being a Greek translation of his real name, both signifying a goat. He published a history of plants, or *Kräuterbuch*, and several other works. Twining plants of no interest.

1945. *Typha*. From *τυφες*, a *kræuterbuch*, and several other works. Twining plants of no interest. The handsomest aquatics of the reed kind; its leaves are of a bluish color, an inch in width, and three feet long; the pollen of the flower is very abundant, and a light being applied to it, a flash of fire is produced. Haller says, that the roots are eaten in salads, and that the downy seeds serve for stuffing pillows. The leaves are sometimes used by coopers, and introduced between the staves of their casks; they are frequently used for making mats, baskets, chair bottoms, and sometimes for thatch. Rubens, and other

- 13054 Leaves cordate ovate acuminate serrated smoothish, Petioles ciliated, Female sepals hairy entire
 13055 Leaves hispid ovate-acuminate serrated, Female sepals pinnatifid setose hispid
 13056 Leaves lanceolate sessile blunt somewhat toothed at end; and stem, which is erect and branched, downy
 13057 Leaves linear lanceolate stalked blunt mucronate, Stem branched diffuse
 13058 Leaves deeply 3-lobed toothed, Middle lobe long

- 13059 Leaves linear nearly plane, Sterile and fertile catkins close together
 13060 Leaves linear plane twice as short as culm, Male and female catkins remote
 13061 Leaves linear convex below, Sterile and fertile catkins a little distant from each other

- 13062 Leaves triangular at the base their sides concave, Common flower-stalk branched, Stigma linear
 13063 Leaves triangular at the base their sides plane, Common flower-stalk simple, Stigma linear
 13064 Lvs. floating plane, Common fl.-stalk simple, Stigma ovate very short, Head of sterile fls. mostly solitary

§ Spikes dioecious.

- 13065 Spike simple dioecious, Fruit ascending ovate shortly acuminate striated rough at the margin upwards
 13066 Spike simple dioecious, Fruit ovate much acuminate recurvate-deflexed smoothish at the margin

§ 2. Spikes androgynous.

* 1. Spike simple.

- 13067 Spike simple androgynous, Flowers few, Fruit distant oblongo-lanceolate acuminate reflexed, Stigmas 2
 13068 Spike simple androgynous male at top, Stigmas 3, Fruit oblong with a short beak horizontal
 13069 Spike simple androgynous of very few fls. Fruit distant lanceolate subulate patenti-reflexed, Stigmas

* 2. Spikelets capitate.

- 13070 Spikes androgynous male below collected in globose involucreated heads, Stigm. 2, Fr. lanc. with 2 points
 13071 Spikes androgynous male above collected in an oblong head, Stigm. 2, Fr. ovate comp. nerved with 2 teeth
 13072 Spikes androgynous male above collected in an ovate form, Stigm. 2, Fr. ov. acumin. Culm branched at base
 13073 Spikl. ster. at extrem. collected into a roundish head, Fruit broad, rotund.-ov. short acum. swell. on both sides nearly entire at the point, Culm obt. angular, Leaves channelled
 13074 Spikes androgynous male above collected into an oval head, Stigm. 2, Fruit ellipt. roundish acuminate bifid

* 3. Spikelets spiked, many-flowered.

[Culm triang. Lvs. plane

- 13075 Lower spikel. fert. : upp. ones ster. all crowd. Fr. with membr. marg. Bract. membrane : low. ones subfoli.
 13076 Inferior and term. spikelets fertile : intermediate ones sterile, Fruit acutely margined, Culms triangular
 13077 Spike androgynous comp. Spikelets obl. altern. clust. male above, Stigmas 2, Fr. round, ov. edged 2 toothed
 13078 Spike androgynous comp. Spikelets ovate alternate clustered male below, Stigmas 2, Fr. ovate 2-toothed
 13079 Spike androg. comp. somew. distich. Spikel. about 5 altern. cun. obl. lanc. male bel. Stig. 2, Fr. ov. edg. bifid
 13080 Spikel. ster. at the base oval about 5 approxim. Fruit as long as the cal. ovate-acumin. convex on one side concave on the other, with a membranaceous margin bifid at the point
 13081 Spike androg. comp. Spikel. 12 altern. ellipt. blunt approxim. male below, Stigmas 2, Fr. ov. lanc. edg. bicusp
 13082 Spike androgynous comp. Spikel. about 5 altern. ellipt. blunt somewhat approxim. male below, Stigmas 2
 Fruit ovate lanceolate edged bicuspidate
 13083 Spike androgynous comp. Spikel. numer. collected in 3s or 5s ovate clustered male above, Stigmas 2, Fruit spreading ovate acuminate 2-toothed edged compressed
 13084 Spikel. ster. at their extremities thrice comp. collected into a cylind. crowded spike, Fruit ovate acuminat. convex-plane acutang.-diverg. Stem very acute triang. Leaves rather broad
 13085 Spike androg. comp. Spikel. about 5 obl. male above clust. Stigm. 2, Fr. spread. ov. acum. with 2 points nerv.
 13086 Spikel. ster. at their extremities crowded into a somewhat ovate head : lower ones with a leafy erect bractea at their base, Fruit roundish ovate convex on one side slightly concave on the other
 13087 Spikel. ster. at their extremities subcomp. collected into a rather long more or less interrupted spike, Fruit convexo-plano ovato-acuminate acutangular divergent rough at the margin upward
 13088 Spike androg. comp. Spikel. 4 altern. obl. male below somewhat approxim. Stigmas 2, Fr. obl. acutisb comp.
 13089 Spike long somew. decomposed branched at the base : lower spikelets remote, Fruit erect smooth at edge
 13090 Spikel. ster. at base 3 or 4 dist. Fr. ov. much attenuat. convexo-plane acutangul. divaricat. rough at margins
 13091 Spike androg. comp. Spikel. about 4 remote male above, Stigm. 2, Fr. ov. acum. 2-tooth. horiz. ciliat. at base
 13092 Spikes subternate remote sessile, Bractes long, Fruit bifid at end
 13093 Spikel. ster. at base dist. Fruit longer than cal. obl.-ovate-acuminate convexo-plane subcutang. obtuse at the marg. the point bifid, Bract. very narr. reaching beyond the culm

and Miscellaneous Particulars.

Italian painters after him, have put it into the hand of Christ as a sceptre, when he was saluted as a king in mockery by Herod's soldiers. The plant appears to be a native of every part of the world, in ponds, ditches, and by the sides of rivers and brooks.

1946. *Sparganium*. From *σπαργάνιον*, a band, in reference to the long ribbon-like leaves of the plants. *Sparganium ramosum* is the commonest species: it has a strong creeping root, and soon fills up a ditch or pond, if suffered to remain unmolested. It is common not only in Europe, but in Barbary, Siberia, and North America.

1947. *Carex*. From the Latin *carere*, to want. The upper spikes of these plants are constantly without seeds, consisting only of male flowers. This numerous family of plants grow mostly in wet swampy grounds,

History, Use, Propagation, Culture,

in bogs, fens, marshes, or in moist woods, where they yield a very coarse grass scarcely touched by cattle. With the exception of two or three species, they are of little use or beauty. Some unfortunately situated husbandmen have recourse to them as cattle fodder, or as thatch or fuel. In Kent, the leaves of the larger

- 13094 Spikes numerous obl. remotish naked, Fruit acuminate bifid recurved many-nerved longer than glumes
 13095 Spikel. ster. at base about 5 rather dist. ellipt. Bractees very minute, Caps. broadly ov. acum. conv. on one side and nearly plane on the other subobtusang. with 2 teeth at the extremity
 13096 Spike androg. comp. Spikelets about 4 male below and close together, Fruit ovate acumin. edged 2-tooth.
 13097 Spike androg. comp. Spikel. about 4 male below and close together, Stigmas 2, Fruit elliptical blunt nerved
 13098 Spike androg. comp. Spikel. about 5 roundish male below somew. approximated, Stigm. 2, Fr. round. ovate beaked 2-toothed ciliated at edge

* 4. Spikelets paniced.

- 13099 Spikes androg. narrow. panicl. male above obl. blunt, Stig. 2, Fr. ov. acum. with 2 points, Scales ov. mucron.
 13100 Spike supradecomponed contracted acutish, Spikelets clustered, Fruit spreading gibbous, Culm roundish
 13101 Spikes androg. narr. panic. male above, Low. branch. remote, Stig. 2 round. ov. beak. 2-tooth. cil. ser. at base
 13102 Spikel. ster. at extrem. thrice comp. and collect. into a panic. spike, Fr. broad. ov. acum. gib. on both sides
 13103 Spike decomp. longish, Scales acute, Fruit ovate plano-convex nerved on each side

* 5. Spikelets racemose.

- 13104 Spikes androg. in three stalked terminal male below erect, Stigmas 2, Fr. obov. blunt, Scales ov. obtuse
 13105 Fertile spikes pedunculated ovate pendulous: the terminal one with sterile flowers at the base, Fruit roundish ovate depressed with a short beak bifid at the point

§ 3. Terminal spikes male: the others androgynous.

- 13106 Male spike solitary stalked: androg. male above about 5 ellipt. remote sessile with a leafy bract, Stigm. 3, Fruit roundish 3-cornered downy

§ 4. Terminal spike androgynous: the others female.

- 13107 Spike androg. pedunc. obov. male below: female about 3 remote somewhat stalked, Stigm. 3. Fr. ellipt. 3-cornered blunt slightly 2-toothed
 13108 Spike androg. pedunc. obl. male below: female 2 sessile close obl. Stigm. 2, Fr. oblong narrowed with an undivided mouth as long as ovate scale

§ 5. Spikes of distinct sexes.

* 1. Male solitary: female sessile and subsessile.

+ 1. Scape sheathed, with membranous bractes.

- 13109 Male spike solit. stalk.: fem. twin stalk. about 5-fl. Stigm. 3, Fr. obov.-glob. furrow. beak. obliq. truncate
 13110 Bractes membran. nearly leafless sheath. Fem. spikes remote few-fl. included in sheath, Lvs. channelled
 13111 Bractes membranous nearly leafless sheathing, Spikes linear lax erect: male shorter, Leaves flat
 13112 Male spike sol. stalk.: fem. 4 dist. stalk. Stig. 3. Fr. ellipt. 3-corner. stalk-smth. short. than obov. cusp. scale
 13113 Leaves oblong lanceolate with a white scarios margin, Heads oblong, Scape not longer than leaves

+ 2. Culm leafy.

- 13114 Fertile spikes sess. roundish approxim. Scales mucron. Fr. obov.-glob. acute pubesc. Culms weak scabrous
 13115 Female spikes 2-3 ellipt. sess. supported by a foliaceous bract, Fruit somewhat downy with a long beak
 13116 Male spike solit.: fem. about 2 close ellipt. sess. Stig. 3, Fr. obl. with a short beak downy as long as ov. scale
 13117 Male spike solit.: fem. about 2 close obl. sess. Stig. 3. Fr. roundish-obov. downy larg. than obl. blunt scale
 13118 Sheaths short scarcely any equal to the flower-stalks, Fertile spikes oblong approximate, Scales elliptico-oblong, Fruit obovate subtriquetrous acute pubescent
 13119 Sheaths very short, Female spikes subsessile cylindrical blunt, Glumes elliptical acute, Fruit downy
 13120 Fertile spikes subsess. obl. Fr. ov. scarcely beaked striated bifid at point, Lvs. very narrow, Culm glabrous
 13121 Bractees long foliaceous, Fert. spikes roundish oval, Fr. obov. with a long recurved beak bifid at the point
 13122 Sheaths and peduncles very short, Female spikes roundish, Fruit spreading on each side globose, Beak straight, Culm smooth

* 2. Male spike solitary: upper female sessile and subsessile; lower stalked.

- 13124 Fertile spikes oblong erect, Scales mucronate, Fruit ovate somewhat inflated subtriquetrous depressed with rather a short beak bifid at the point
 13125 Sheaths long shorter than peduncle, Spikes cylindrical remote somewhat compound, Fruit 2-nerved
 13126 Male spike solit.: female twin; lower stalked obl. Stigmas 2, Fruit ellipt. blunt as long as blunt scale
 13127 Fertile spikes ov.: the lower one pedunculated, Scales obl. Fruit subglob. apiculate with a short bifid beak
 13128 Male spike solitary: female 3 distant; two lower stalked, Stigmas 3, Fr. oblong compressed 3-cornered hispid at edge, Mouth membranous 2-lobed
 13129 Fertile spikes 1-3 somewhat drooping, Fruit scarcely longer than the scale lax especially the lower ones ovate with a short beak bifid at the point
 13130 Male spike sol. obov.: female about 3 close; 2 lower on long stalks, Stigmas 3, Fruit compress. obov. downy beaked 2-toothed at end
 13131 Male spike sol.: female about 3 distant; two lower remote, Stig. 3, Fr. ov. beaked with a membran. mouth
 13132 Male spike sol.: fem. 3 rem.: two lower stalked, Stigmas 3, Fr. glob. ovate nerved ventric. shortly beaked
 13133 Fert. spikes subeynd. with dist. fls. Bract. foliaceous, Fr. subglob. somew. inflated obt. glab. entire at point
 13134 Male spike sol.: female about 4 remote; lower on a long stalk. the stalks of the others enclosed, Stigm. 3, Fr. globose shining with a short beak 2-toothed at end

and Miscellaneous Particulars.

species are used for tying the vines of hops to the poles; in Italy they are put between the staves of wine casks to make them tight, woven over Florence flasks, or in chair bottoms. The Laplander combs and dresses some species of sedge, as we do flax, and in winter stuffs his shoes and gloves with it, as a defence against the

History, Use, Propagation, Culture,

extreme rigour of his climate. *C. remota* is a very elegant plant. *C. paniculata* grows in bogs in immense tufts, making a firm support for the heaviest bodies. *C. Fraseri* is the handsomest species of the genus, from one to three feet long; in Italy the leaves are used by the glass-makers to bind their wine flasks; by the chair-makers to bottom chairs; and by the coopers to place in the junctures in the heads of casks, in the same manner as the leaves of the *Typha* are used in the same country, and the stalks of *Scirpus lacustris* in England. *C. arenaria* increases rapidly in loose sand, and is sometimes planted with a view of fixing soils of this description, along with *Elymus* and *Arundo*.

1948. *Cobresia*. Named by Willdenow, after a German nobleman of the name of De Kobres, who is said to have been a great promoter of natural history. The plants resemble *Carex*.

- 13135 Male spike sol. Scales obl. with very long beaks: female cylind. 2; stalk of the lower exerted, Stigm. 3, Fr. ovate inflated 5-nerved beaked
- 13136 Male spike sol.: fem. 2 obl. close; low stalk. Stigm. 3, Fr. ellipt. glob. shin. bifid at end larg. than ov. scale
- 13137 Male spike sol.: fem. 3 rem.; lower stalk. Stigm. 3, Fr. ov. nerv. memb. at mouth long than mucron. scale
- 13138 Male spike sol.: fem. 3 few-fl. 2 close sessile; lower rad. on a very long stalk, Stigm. 3, Fr. obov. obl. 3-cornered with a very short beak
- 13139 Sheaths none, Bractæas foliaceous auric. at base, Spikes sess. obl. or subcylind. obt. Fruit broadly elliptical
- 13140 Fertile spikes nearly sessile cylindric. filif. acum. Fr. ovate somewhat acute plane above on each side, Culm acutely angular straight
- 13141 Fert. spikes cylind. very long droop. Fr. ov. short. acum. bif. at extremity closely imbricated, Leaves broad
- 13142 Dignynous, Sheaths none, Spikes ovate: upper sessile, Leaves somewhat recurved rigid, Fruit compressed
- * 3. Male spike solitary, female all stalked.
- 13143 Fert. spikes few-fl. lax drooping, Fr. as long as ovate membranæ. decid. scales oblongo-ovate acuminate
- 13144 Fert. spikes pedunculated oblongo-cylind. pendul. Bract. subfoliac. Fruit ov.-ellipt. tumid obt. glabrous
- 13145 Sheaths elongated shorter than the flower-stalk, Fruit elliptical ovate beaked (black) bifid at the point
- 13146 Fert. spikes narrow obl. very few-fl. lax pendul. Bract. subsetaceous, Scales acute longer and broader than the fruit, Fruit ovate somewhat acum. striated
- 13147 Fert. spikes oblongo-ovate pendulous, Bractæas subsetaceous, Scales acute as long as the fruit, Fruit ellipt. rotundate striated shortly mucronate
- 13148 Fertile spikes upon long footstalks cylind. pendul. Bract. very leafy, Scales setaceous, Fruit oblong very much acuminate cloven at the tips striated
- 13149 Male spike sol.: fem. about 4 remote filiform stalked cernuous, Stigm. 3, Fr. dist. altern. obl. beaked bifid
- 13150 Fert. spikes filif. rather slender slightly drooping, Fr. broadly ov. much acum. cleft at point, Lvs. narrow
- 13151 Male spike solit.: fem. usually twin stalk. filif. Stigm. 3, Fr. lanc. hisp. scabr. 2-toothed long. than obl. scale
- 13152 Fert. spikes slend. filif. nearly erect, Fruit ov.-lanc. nerved slightly recurv. loose. imbric. Lvs. rather broad
- * 4. Male spikes more than one.
- 13153 Fertile spikes subcylindrical drooping, Fruit obovato-globose obtuse rather downy entire at the point
- 13154 Male spikes twin: fem. twin obl. sess. rem. Stigm. 3, Fr. ov. nerved forked ventric. larg. than ov. lanc. scale
- 13155 Male spikes 3: fem. twin on short stalks nodd. cylind. Stigm. 3, Fr. ellipt. ventricose with a short ent. beak
- 13156 Fert. spikes short. peduncul. oblongo-cylind. their cal. subcusp. Fr. ov. short. beak. bif. at point very pubes.
- 13157 Lvs. subsessile sublin. thickened, Stigm. 2, Fr. ellipt. with short beak ent. at end as long as rounded scales
- 13158 Fert. spikes long cylind. acum. slender erect when in fruit, Fr. oval swelling subacum. entire at point, Culm acutely angular scabrous
- 13159 Scal. of sterile spike obtuse, Fertile spikes cylind. obtuse, Fruit oblongo-ovate acute bifid at point striated
- 13160 Foliaceous, Scal. of sterile spike acum. Fertile spikes scarcely peduncul. broadly cylindrical acute, Fruit ovate subacum. bifid at the point
- 13161 Fert. spikes cylind. slightly droop. Scal. lanc. Fr. broadly ovate inflat. subulato-rostrate deeply bifid at point
- 13162 Fert. spikes cylind. long near. erect, Scal. lanc. Fr. crowd. subglob. inflat. setaceo-rost. slightly bif. at point
- 13163 Male spikes 2: female 3 obl. remote subsessile, Stigm. 3, Fr. obl. compr. rostr. bifid ciliate serrat. at edge
- 13164 Male spikes 2: female 3 obl. remote subsessile; lower subrad. Stigm. 3, Fr. ovate comp. 2-toothed hairy
- 13165 Bractæas long foliac. Fertile spikes short cylind. distant their seal. cuspidate, Fr. ov. with long beak hairy
- 13166 Fert. spikes droop. cylind. all the seal. acum. or mucr. Fr. ov. triang. with rather long acum. beak bif. at point
- 13167 Male spikes twin: fem. 4 dist. stalk. pendul. cylind. Stigm. 2, Fr. round. ellipt. ventric. with very short beak
- 13168 Male spikes 2: fem. 2 rem. on very long stalks erect obl. Stigm. 2, Fruit ellipt. with short beaks ent. at end
- 13169 Male spikes about 4: female 2 erect stalked cylind. Stigm. 3, Fr. obov. obt. shorter than obl. blunt scale
- 13170 Male spikes 3: fem. 2 cylind. stalked erect, Stigm. 3, Fr. ov. glob. beaked with 2 forks, Beaks hispid

13171 Spikes 3 or 4 alternate male above

13172 Fruit oblong 3-cornered smooth at edge

13173 Leaves entire
13174 Leaves serrated

13175 Culm half round at top and obtuse, Flowers naked, Fruit ovate
13176 Culm round, Flowers naked, Fruit nearly round

and Miscellaneous Particulars.

1949. *Uncinia*. So called from *εὐκός*, a hook, in allusion to the hooked awn, which in the fruit becomes hardened. Plants with the habit of *Carex*.

1950. *Zea*. The Greek name of corn of some kind. It is derived from *ζῆα*, to live, and applied to this nutritive plant with propriety. The word *Maize* is the denomination of the vegetable among the South Americans. *Zea* Curagua is the curious Valparaiso corn, to which a sort of religious reputation is attached, on account of the grains, when roasted, splitting regularly into the form of a cross. Of the well known Indian corn, *Z. Mays*, there are numerous varieties, some of which are sufficiently hardy to thrive in this climate.

1951. *Coix*. A name used by Theophrastus to designate a kind of grass. *C. Lacryma*, commonly called Job's tears, derives its name from the appearance of its shining pearly fruit, which, when suspended on its slender pedicels, resembles in no inconsiderable degree a falling tear. Tropical grasses, which flower and seed plentifully in rich light soil.

History, Use, Propagation, Culture,

1952. *Tripsacum*. So called by Linneus, from τριπέλας, to bruise or crush, in allusion to the purpose to which its grain may be applied. Forage grasses of the West Indies.

1953. *Heteropogon*. From ἑτερος, various, and πογών, a beard; in allusion to the various kinds of awns with which the flowers are furnished.

1954. *Olyra*. A name under which Homer speaks of a grain which was used as the food of horses, and which has been thought analogous to Barley. The plant now so called is a native of America, and has no resemblance to that of the ancients.

1955. *Alnus*. From the Celtic word *al*, near, and *lan*, the edge of a river, in reference to the places where the species grow. *A. glutinosa*, *Aulne*, Fr., *Eller*, Ger., and *Aino*, Ital., is a well known timber tree, which will grow in marshy situations. The timber is applied to a variety of purposes, and in general for all works intended to be constantly under water, for turnery and furniture. The bark is used by dyers and tanners; the sap being of a yellow color and very astringent. There is a variety with cut leaves sold by the nurserymen as an ornamental tree, though it is more curious than showy.

1956. *Betula*. *Betu* is the Celtic word for the Birch. *Bouleau*, Fr., *Birchenbaum*, Ger., and *Betulla*, Ital. *B. pendula* is the most graceful tree of the genus; it grows both in mountainous situations and bogs, from Lapland to the subalpine parts of Italy and Asia. *B. lenta*, the mahogany birch, mountain mahogany, or cherry birch of Canada, abounds in the middle states of Pennsylvania, New York, and the Jerseys; but disappears altogether in the higher latitudes of the northern states. It is thought a very fit tree for planting in the valleys of the mountainous districts of Britain. Its growth is rapid, and the timber is close grained, beautifully variegated, and well adapted for cabinet work. The leaves, which appear early in spring, possess

- 13177 Spikes 3 clustered : male above ; female below
 13178 Spike solitary : male above ; female below
 13179 Spike solitary hermaphrodite flexuose, Spikelets somewhat distant

 13201 Leaves roundish ovate nearly equally serrate smooth, Female catkins oblong
 13202 Lvs. deltoid acute subcord. doubly serr. beneath with branches pubesc. Scales of cones with lateral lobes [rounded
 13203 Leaves oblong, Petioles smooth, Anthers sagittate linear
 13204 Leaves ovate, Petioles hairy at edge, Anthers ovate sagittate

- 13205 Leaves opposite oblong : younger downy · old ones smooth, Fl. axillary solitary

and Miscellaneous Particulars

a peculiar fragrance, which they retain after being dried in a stove, affording by infusion an agreeable diluent, superior to some of the common teas of commerce.

B. populifolia and *papyracea* are elegant rapid growing trees, well deserving culture for their timber. All the species are ornamental, and more or less fragrant ; and *B. pumila* and *nana* are pretty little shrubs. Of the *Betula papyracea* the North American Indians construct their large portable canoes, from which circumstance that species is known by the name of canoe birch. *Betula lenta* is the most interesting of the genus, on account of the excellence of its wood. It is known by the names of mountain mahogany, black birch, cherry birch, and sweet birch. This last appellation it has from the sweet scent the branchlets give when bruised.

1957. *Burus*. An alteration of $\beta\alpha\beta\alpha$, its Greek name. *B. sempervirens*, *Buis*, Fr., *Euchsbaum*, Ger., and *Bosso*, Ital. is one of the most useful of evergreen shrubs ; edgings of the dwarf variety are of universal use in the walled gardens of Europe ; and what is called the tree box is not less valuable as an evergreen shrub, which will grow under the shade and drip of trees. The box is a native of most parts of Europe, from Britain southwards, and is very abundant in different parts of France and Switzerland. It abounds in many countries of Asia, as about Mount Caucasus, in Persia, China, Cochin China, and America. It was formerly very common in England, but has gradually disappeared as agriculture extended. Box-Hill in Surrey, Boxley in Kent, and Boxwell in Gloucestershire, are named from their abounding in this tree. The timber of the box tree is of considerable value. It is sold by weight, and being very hard and smooth, and not apt to warp, is very well adapted to a variety of nicer works. It is as extensively employed now as it appears to have been in the days of Evelyn, "for the turner, engraver, carver, mathematical instrument maker, comb and pipe or

History, Use, Propagation, Culture,

flute maker; and the roots for the inlay, and cabinet maker. Of box are made wheels and shivers, pins, pegs for musical instruments, nut-crackers, button-moulds, button-shuttles, hollar-sticks, bump-sticks, and dressers for the shoemaker, rulers, rolling-pins, pestles, mall-balls, beetles, tops, tables, chessmen, screws, bobbins for bone-lace, spoons, knife-handles, but especially combs."

The English wood is esteemed inferior to that which comes from the Levant, and the American box is said to be preferable to ours, for most purposes; but the English is superior for the purpose of the engraver.

The ancients made combs of box, and musical instruments to be played upon by the mouth. The Romans likewise clipped it into form, for which nothing, says Pliny, is more fit. And Martial mentions clipped box trees in the gardens at Bassus's country-house.

The tree box was second to the yew with us in former times for the purpose of being clipped into the shape of animals, &c.; but the dwarf box stood unrivalled "for bordering up a knot, and was esteemed a marvellous fine ornament to the flower garden."

The branches were in request among our ancestors for decking up houses; they are still seen among other evergreens in churches at Christmas, and in some countries they are borne by attendants at funerals.

Box has been much celebrated as a medicine in the venereal disease, colicks, intermittent fevers, and even madness. According to Dr. Blaine, it is the principal ingredient in Well's Watford Drink, which is given as a preventive to canine madness.

Pliny affirms, that no animal will touch the seed of box. Gmelin relates, that the branches are fatal to the camels that eat them. None of our animals seem to touch this tree. Corsican honey was supposed by the ancients to owe its infamy to the bees feeding on the box.

1958. *Cicca.* A word of unknown meaning. *Cicca disticha* thrives in light loamy soil, and is increased by cuttings with their leaves on, planted in sand, and covered with a hand-glass.

1959. *Morus.* *Moræa* was the Greek name of the Mulberry; it is derived from the Celtic *mor*, which signifies black. *Murier*, Fr., *Maulbeerbaum*, Ger., and *Moro*, Ital. *M. alba* is commonly cultivated in France and other countries for its leaves, to feed silk-worms; though in some parts of Spain and in Persia they are said to prefer the black mulberry. In China, it appears that both sorts are grown for the same purpose. The most valuable variety of *M. alba* is one grown in Italy, and especially in Lombardy, with vigorous shoots, and much larger leaves than the other. A number of plants of this variety have been lately imported for the purpose of making a plantation in the south of Ireland, with a view to try the growth of silk in that country. In France the white mulberry is grown as pollard elms are in England; in Lombardy it is grown exactly in the same way as we grow willows for baskets, and in similar soil; in China it is also grown in moist loamy soil, and both there and in the East Indies as low bushes, and the plantation rooted up and renewed every three or four years. In many parts of the continent, when the leaves are wanted for the worms, they are stripped off the young shoots, which are left naked on the tree; in other places the shoots are cut off, which is not so injurious to the tree, while the points of the shoots, as well as the leaves, are eaten by the worms. The plants are sometimes raised by seed, but more commonly by layers; the Italian variety is frequently grafted on seedling stocks of the common sort, in order to preserve it from degenerating. In the East Indies, the plants are raised from cuttings, three or four of which are placed together where they are finally to remain. (*Encyc. of Agr.* 854.)

The fruit of the white mulberry is white, and less acid than that of the black species. *M. nigra* is naturally a stronger tree than the other; the fruit is of a dark blackish red, and of an agreeable aromatic and acid flavor. It has a place in the *Materia Medica*, as cooling and laxative, allaying thirst, and being grateful in febrile diseases. Young trees, like most others of the Monœcia class, often produce

13206 Leaflets oblong, Racemes lateral

13207 Leaves deeply cordate unequal at the base ovate lobed unequally serrated smooth

13208 Leaves slightly cordate equal at base ovate or lobed equally serrated smooth

13209 Leaves cordate ovate or lobed unequally toothed scabrous

13210 Leaves cordate ovate acuminate or 3-lobed equally serrate scabrous soft beneath, Fem. spikes cylindrical

13211 Leaves oblong unequal at base, Spines axillary solitary

13212 Leaves opp. ovate-obl. acum. toothed smooth, Fl. dioecious, Male spikes clust. interrupt. : fem. cylindrical

13213 Lvs. altern. obl. narrow. at each end entire, Spikes axill. clustered interruptedly branched, Branches hairy

13214 Lvs. altern. broadly lanc. acum. serrated rugose, Fl. cluster. axill. and lateral monoecious, Males 3-androus

13215 Lvs. altern. ovate-lanceolate acuminate serrated scabrous, Fl. clustered lateral, Stem herbaceous

13216 Leaves ovate acute entire, Stem simple ascending

13217 Leaves opposite ovate or somewhat heart-shaped deeply serrated, Heads of fruit globose

13218 Leaves opposite cordate serrate, Fruit-bearing catkins globose

13219 Leaves opposite entire convex oblong, Fruit-bearing catkins globose

13220 Leaves opposite ovate nearly entire, Heads of fruit globose

13221 Leaves opp. ovate blunt-pointed 3-ribbed serrated, Fl. stalks somewhat corymbose shorter than footstalks

13222 Leaves opposite ovate rounded scabrous, Flower-stalks in the axillæ of the upper leaves

13223 Leaves opposite ovate pointed copiously serrated, Stipulas elliptical entire glauc. C. corymbs much branched axillary longer than the footstalks

ana Miscellaneous Particulars.

only male blossoms for many years after they are planted, and yet afterwards become fruitful. As the tree increases in age, it increases in fruitfulness; and in full grown trees the fruit is much larger and better flavored than in young ones. In some of the old gardens near London, there are mulberry trees of a great age, which are very healthy and fruitful. Bradley says, that most of these were planted in the times of James I., who attempted unsuccessfully to set up a silk manufacture in England. The fruit of the mulberry, like that of the strawberry and raspberry, is said not to undergo the acetous fermentation in the stomach, and therefore it may be safely eaten by gouty and rheumatic persons. It is a mistake, however, to suppose that these fruits are lighter than others which have not the same antifermentative qualities.

The mulberry is generally propagated by layers, but it may also be increased by seeds, cuttings, or grafting. It is generally grown as a standard in orchards; but will produce fruit sooner as an espalier or wall tree.

M. rubra has black shoots, rougher leaves than the black mulberry, and a dark reddish fruit, longer than the common sort, and of a very pleasant taste. The tree is cultivated in China for feeding silk-worms, but not so generally as the white mulberry. *M. indica* is also cultivated for the same purpose. *M. tatarica* bears pale red berries of an insipid taste, but eaten in Russia fresh, conserved, or dried; a wine and a spirit are also made from them, and the leaves are used for feeding silk-worms.

M. tinctoria is a tall branching tree, with a fine head, smooth leaves, and awl-shaped solitary spines. The whole plant abounds in a slightly glutinous milk of a sulphureous color. The timber is yellow, and a good deal used in dying that color, for which it is chiefly imported into Europe, under the name of Fustick-wood. The berries are sweet and wholesome, but not much eaten, excepting by birds.

All the species of *Morus* are remarkable for putting out their leaves late; so that when they appear, gardeners may safely set out their greenhouse plants, taking it for granted, that all danger from frost is over.

1960. *Bachmeria*. Named after George Rudolph Bohmer, a German botanist, and a member of the academy of Wittemberg. He published several works, besides an academical dissertation upon the cellular tissue of vegetables. Plants of little beauty, and easy cultivation and propagation.

1961. *Pilea*. So called by Mr. Lindley, from $\pi\lambda\iota\sigma$, a cap; in allusion to the nature of one of the divisions of the perianthium. A neat little creeping plant, which makes a good cover to hide the earth of large pots of tropical plants.

1962. *Urtica*. A word formed from *uro*, to burn, in allusion to the stinging properties of most of the species. The English term *Nettle* seems to be the Anglo-Saxon *Netel*, which is itself an alteration of *medl*, a needle, in the same language. *U. dioica* grows all over Europe, in Barbary, Siberia, and Japan, in hedges, neglected fields, gardens, and pastures. This species, *U. urens*, and *pulifera*, with one or two others, are furnished with stings.

The small projecting bristles or prickles with which they are covered are tubular, and stand on a bag filled with a poisonous juice; they are perforated at the point, and when they are gently pressed vertically, the pressure at once forces the poison to ascend the tube, and enables the point to lodge it in the skin. The tops of the tender shoots of *U. dioica* are sometimes used as a pot herb early in spring, and they have even been forced for that purpose. A strong decoction of the plant salted, will coagulate milk very readily and without any disagreeable flavor. The stalk is found to have a texture somewhat like that of hemp, and to be capable of being manufactured into cloth, ropes, and paper. The leaves are the only food of the caterpillars of three of our most beautiful butterflies, *Atalanta*, *Paphia*, and *Urtica*, the principal food of the lo, and the occasional food of the *Comma album*; the caterpillars also of the *urticata* and *verticalis* moths feed on it; a great number of other indiscriminate feeders devour its foliage; and the bases of the leaves in autumn are frequently disfigured by tubercles, which contain small maggots, probably producing *Musca Urticæ*. As a remedy for the

History, Use, Propagation, Culture,

sting of the nettle, its own juice, or that of the dock, may be applied. The exotic species are of easy culture.

13263. *Pachysandra*. From *παχυς*, thick, and *ανθε ανδρος*, signifying, in botanical language, a stamen; the stamens are very stout. A plant of easy culture in common light soil, and freely increased by suckers from the roots.

13264. *Diotis*. From *δις*, double, and *εσ ωτος*, an ear, on account of the two appendages which exist at the base of the florets. A shrub of no great beauty, which thrives in light soil, and is easily increased by layers or cuttings under a hand-glass.

13265. *Empleurum*. From *επ*, in, and *πλευρα*, the pleura, or membrane which envelops the lungs. The seeds of this plant are attached to a sort of coriaceous membrane.

13266. *Aucuba*. The Japanese name of the plant. It is a well known laurel-like evergreen shrub, with leaves mottled with yellow. Female flowers only have been produced in the gardens; but according to Kœmpfer.

- 13224 Leaves opposite elliptic-oblong acute serrated towards the point reticulated beneath, Stipulas ovate-entire, Clusters panicle about the length of the footstalks
- 13225 Leaves opposite elliptical acute serrated triple-ribbed their veins hairy, Stipulas roundish permanent, Clusters slightly branched, Stem shrubby shaggy with rusty hairs
- 13226 Leaves opposite elliptical with about 5 ribs, Clusters of flowers nearly simple
- 13227 Leaves ovate acuminate cordate at the base, Clusters of flowers much branched in pairs mostly dioecious
- 13228 Leaves opposite broadly ovate somewhat heart-shaped coarsely serrated, Fls. monoecious: male in twin upright unbranched stalked spikes with winged recept.; fem. in nearly sess. spikes shorter than footst.
- 13229 Leaves opposite ovate obl. acute 3-ribbed serrated thickish reticulated and pale beneath, Corymbs stalked forked longer than the leaves, Flowers tufted
- 13230 Stem petioles and lvs. covered with rigid dense stimuli, Lvs. ov. acum. doubly serrat. Spikes comp. whorled
- 13231 Leaves opposite in three deep pinnatifid segments, Clusters cylindrical in pairs erect
- 13232 Leaves opposite elliptical serrated 3-ribbed rugged, Clusters short dense terminal, Stem simple erect
- 13233 Lvs. chiefly term. opposite ellipt.-lanc. pointed 3-ribbed entire nearly smooth. Stem angul. leaf. below, Cluster lateral dioecious
- 13234 Leaves opposite ovate-lanc. serr. heart-shaped at the base, Stem and footstalks hispid, Flowers dioecious, Clusters in pairs somewhat branched about as long as the footstalks
- 13235 Leaves opposite ovate-lanc. entire, Stem much branched, Flowers dioecious
- 13236 Leaves opposite ellipt. 3-ribbed crenate fringed acute at each end entire at the base, Stem divaricate, Flowers aggregate on axillary stalks about the length of the footstalks
- 13237 Leaves long lanc. very rugose: glabrous above; beneath having a fine white down
- 13238 Stem downy roughish, Lvs. on long stalks ov. acute crenat. downy roughish 3-nerv. Stip. lanc. acute serr.
- 13239 Lvs. alternate ov. serrat. minutely heart-shap. at the base, Clusters axill. forked, Fruit in orbicular corymbs
- 13240 Lvs. alternate ovate somewhat hairy serrated, Stipulas obtuse, Clusters axill. compound spreading shorter than the leaves: the lower ones male sessile; upper female stalked
- 13241 Leaves alternate roundish-ovate pointed toothed 3-ribbed snow white and downy beneath, Clusters axill. repeatedly compound, Fl. fasciculate
- 13242 Leaves alternate heart-shaped toothed prickly as well as the shrubby stem, Calyx of the fruit pulpy
- 13243 Leaves altern. heart-shaped acutely crenate rough above soft and downy beneath, Panicles lateral leafless forked divaricate, Flowers capitate dioecious, Stem arborescent
- 13244 Leaves on long stalks cordate acuminate acutely serrated stinging, Spikes panicle
- 13245 Leaves stalked cordate acuminate serrated stinging, Racemes axillary
- 13246 Leaves cordate entire and 3-lobed coarsely tooth-serrated, Petioles and stem with long strigose prickles
- 13247 Stem with very long stimuli, Leaves pinnatifid with finely toothed segments, Spikes axillary compound
- 13248 Stem downy, Leaves on long stalks ovate-lanceolate acuminate subcrenate rough above soft beneath
- 13249 Stem procumbent, Leaves short oval crenate toothed above, Calyx minutely ciliated
- 13250 Leaves ovate lanceolate acuminate nerved

13251 Leaves lanceolate downy, Female flowers woolly

13252 Leaves lanceolate ensate crenate smooth, Capsules 1-celled

13253 The only species

13254 The only species

13255 Flowers tetrandrous, Leaves alternate linear lanceolate entire rough

13256 A small lactescent tree with alternate entire leaves and spiny branches

and Miscellaneous Particulars.

the fruit is a red oblong drupe, like a laurel berry, with a white sweetish pulp, and a kernel with a bitter taste.

1967. *Littorella*. From *litus*, in allusion to the places where it grows. A pretty little delicate plant, with long tremulous white stamens.

1968. *Serpucula*. From *serpo*, to creep, on account of the habits of the species.

1969. *Mactura*. Dedicated by Nuttall, to William Maclure, Esq. of the United States, a philosopher, whose devotion to natural history, and particularly to the geology of North America, has scarcely been exceeded by Ramond or Saussure in Europe. A spreading deciduous tree, about twenty or thirty feet high, with a yellow axillary berry the size of an orange, but not so succulent, and said to be as agreeable when fully ripe. It was originally found by Hunter and Dunbar, on the banks of the Little Missouri or Washita river, also near Natchitoches, and upon the banks of the Arkansa.

History, Use, Propagation, Culture.

1970. *Exocarpus*. So called from *εξω*, outside, and *καρπος*, fruit, because the nut appears to be seated on the outside of the pericarp, on account of the great receptacle on which it is placed.

1971. *Nephetium*. According to Dodoens, *Nephetium* was a name anciently given to the Burdock. The modern plant bears bristly fruit like the involucre of the Burdock. It is an excellent fruit, known in the islands of the Indian Archipelago by the name of Rambutan; grows in rich light loam, and is struck in pots or sand under a glass.

1972. *Schizandra*. From *σχιζω*, to cut, and *ανδρ*, a stamen; its stamens are split. A handsome plant, which grows in light loam and peat, and ripened cuttings root in sand under a hand-glass.

PENTANDRIA.

13257 The only species

13258 Leaves alternate pinnated, Racemes erect shorter than leaves

13259 Leaves lanceolate oval acute at each end end, rarely somewhat toothed

13260 Leaves bipinnatifid toothed, Petioles winged

13261 Leaves ovate-lanceolate cordate toothed, Petioles with an appendage

13262 Stem unarmed, Leaves cordate 3-nerved

13263 Stem unarmed, Leaves cuneiform ovate somewhat 3-lobed

13264 Spines ternate, Leaves 3-lobed

13265 Stem unarmed, Fruit oval aculeate, Prickles hooked echinate at base

1. Triandrous.

13266 Clusters axillary, Leaves linear-lanceolate cuneate retuse, Stem branched diffuse

13267 Clusters axillary, Leaves linear-lanceolate acute mucronate, Stem branched erect

13268 Clusters axillary, Leaves obovate retuse, Stem square simple

13269 Clusters axillary, Flowers trid, Leaves obovate emarginate, Stem roundish branched

13270 Clusters axillary stalked roundish, Leaves ovate-lanceolate colored

13271 Clusters sessile, Leaves oblong lanceolate colored

13272 Clusters sessile capitate, Leaves ovate acuminate blunt colored

13273 Clusters in short spikes, Cal. and bract. with hooked bristles, Leaves oblong lanceolate emarginate

13274 Clusters shortly spiked ovate, Leaves ovate lanceolate emarginate

13275 Clusters somewhat spiked axillary solitary, Leaves rhomboid roundish

13276 Clusters spiked, Spikes axillary and terminal, Leaves ovate-lanceolate emarginate

13277 Clusters spiked loosely, Leaves subcordate ovate emarginate shorter than petiole

13278 Clusters somewhat spiked and 3-leaved: axillary in pairs, Leaves rhomboid lanceolate

13279 Clusters spiked, Leaves rhomboid-ovate acute

13280 Clusters somewhat spiked rounded, Leaves elliptical retuse, Stem erect

13281 Clusters axillary branched, Leaves rugose oblong very blunt emarginate

13282 Leaves subrhomboid acute repand bellate, Spikes terminal, Sepals mucronate pungent

13283 Clusters somewhat spiked, Flowers 3-leaved, Leaves ovate retuse, Stem diffuse

13284 Clusters spiked, Flowers 3-leaved, Leaves rhomb.-ov. bluntish retuse, Stem prostrate branched

13285 Clusters spiked terminal, Leaves ovate-oblong, Stem erect somewhat branched

13286 Clusters axillary twin triandrous, Male flowers 3-leaved, Leaves elliptical emarginate wavy at edge

13287 Clusters 3-leaved, Female flowers funnel-shaped, Leaves rhomboid ovate emarginate

13288 Leaves ovate, Spikes interrupted compound, Spikelets inflexed, Stem weak

13289 Spike very short few-fl. Leaves rhomboid lanceolate, Capsules not dehiscent

2. Pentandrous.

13290 Leaves oval acute somewhat wavy toothed, Clusters axillary cymose

13291 Raceme decomposed clustered erect, Leaves ovate-lanceolate

13292 Raceme compound erect straight, Leaves ovate concave

13293 Racemes supra-decompound, Branches spreading pubescent, Leaves ovate-lanceolate

13294 Racemes supra-decompound erect, Branches spreading smooth, Leaves oblong acute

13295 Racemes supra-decompound erect clustered, Branches downy, Leaves ovate wavy

13296 Racemes compound erect, Leaves ovate blunt mucronate

13297 Racemes compound nodding, Leaves ovate lanceolate

13298 Racemes compound nodding, Leaves lanceolate

13299 Racemes compound erect clustered, Leaves oblong lanceolate mucronate

13300 Racemes decomposed naked spreading, Leaves lanceolate ovate

13301 Racemes simply spiked, Flowers axillary clustered, Leaves ovate acute

13302 Racemes decomposed pendulous, Leaves lanceolate ovate, Stem nodding

and Miscellaneous Particulars.

1973. *Franzeria*. A genus dedicated by Cavanilles to Antony Franzer, a botanical physician, whose merits are forgotten. Cuttings root in loam and peat under a hand-glass.

1974. *Xanthium*. From *ξανθός*, yellow, a color which it is asserted by Dioscorides, *lib. 4. cap. 153*, that an infusion of this plant communicates to the hair. Weeds of little beauty and easy culture.

1975. *Amaranthus*. From *α*, privative, and *μαρτυρο*, to wither, because the flowers of most of the species retain their bright colors when dead. Some of the species are very ornamental, and most of them might probably be used as spinage, as some sorts are in the East. *A. polygamus* is used in this way in Guiana and China, and *A. oleraceus*, *tristis*, and *viridis*, in India. *A. melancholicus* and *tricolor* are popular tender

History, Use, Propagation, Culture,

annuals, and *A. sanguineus* and *caudatus* common border flowers; like all the species, they are of easy culture in light rich soil. Most of the species are very prolific in seeds, which preserve their germinating quality several years.

1976. *Luffa*. Its name in Arabic is *luff*, according to Forskahl. A curious kind of gourd, not often seen on account of its offensive odor. It is cultivated in Arabia and China. It climbs up the Palm trees, covering and elegantly adorning their trunks. The fruit when young is pickled, like the Mango; but Europeans think it has a disagreeable taste, and is not very wholesome. *L. Charantia* has a fruit with a yellowish skin, but very red flesh, and when ripe, it bursts elastically. Culture as in *Cucumis*.

1977. *Ambrosia*. A poetical name. *Ambrosia* is the name of the food of the heathen divinities, as nectar was their beverage; of the former, the odor was delightful, whence its name has been applied to an herb, the leaves of which, when bruised, emit a grateful scent. Weedy plants of no beauty.

1978. *Securinega*. From *securis*, a hatchet. The name was given by Commerson, because the wood was so hard as to be capable of being manufactured into cutting instruments. It grows and flowers freely in loam and peat, and cuttings strike in sand under a hand-glass.

1979. *Zizania*. One of the Greek names of the rye-grass was *ζίζανιον*; according to Golius, the same plant was called by the Arabs *Zolân*. The modern plant has no relation to the ancient, being a native of America, where it is called Canada rice. This plant has been acclimated in Middlesex and Ross-shire; it grows on the margins of ponds, and is exceedingly prolific of bland farinaceous seeds, which afford a very good meal. It abounds in all the shallow streams of North West America, where its seeds contribute essentially to the support of the wandering tribes of Indians, and feed immense flocks of wild swans, geese, and other water fowl. Pinkerton says, this plant seems intended by nature to become the bread corn of the north.

1980. *Pharus*. From *φαγος*, a covering. Brown gave this name to the plants, because their long broad leaves are employed as wrappers for various purposes by the natives of Jamaica. Fine stove grasses.

1981. *Guettarda*. Etienne Guettard was a French botanist, who published in 1747, a catalogue of the plants growing in the vicinity of Estampes. Splendid plants, which grow in loam, peat, and sand; and are increased by cuttings in sand in a moist heat and covered.

1982. *Sagus*. So named in allusion to the nutritive properties of the substance obtained from it. From this palm is produced the Sago of the shops. The wood is full of white pith, like that of elder; the pith is taken out, bruised in a mortar, and then put into a cloth or strainer, held over a trough, and water being poured in, the pith is washed through the cloth into the trough; the water being then drawn off, the sago is taken out and dried for use or transportation. The fruit is eaten by the Japanese, but the tree is chiefly esteemed for its highly nutritive pith.

1983. *Cocos*. Linnæus regards this name as of Greek origin. In that language, *κοκκος* means a kind of fruit, but it does not appear that there was any relation between that and the modern cocoa nut. D'Herbelot

- 13303 Racemes pentandrous terminal compound, Axilla spiny
 13304 Clusters densely spiked somewhat whorled, Spikes decompound erect colored, Lvs. obt. ellipt. red beneath

and Miscellaneous Particulars.

says, (*Bibl. Or.* 278.) that in India the fruit is called *cozi*, whence the Turkish name *coz*, for a nut : but this requires confirmation. In Malabar it is called *tenga*, in the Moluccas *calappa*, and by the Brahmins *medo*. *C. nucifera* is a native of, and cultivated in, most places within the tropics. The trees grow to a great height, with a straight trunk, and, like almost every species of the Palm tribe, without branches. The leaves are from twelve to fifteen feet long ; the flowers come out round the top of the trunk in large clusters, inclosed in a sheath, and the nuts succeed them, commonly ten or twelve together.

There are few trees more extensively or variously useful. The leaves are employed as thatch to cover houses, and to make mats either for sitting or lying upon. The leaf, when reduced to fine fibres, is the material of such a beautiful and costly carpeting is fabricated for those in the higher ranks ; the coarse fibres are made into brooms. After these useful materials are taken from this leaf, the stem still remains, which is about the thickness of the ankle, and furnishes firewood.

The wood of this palm, when fresh cut, is spongy ; but becomes hard after being seasoned, and assumes a dark brown color. On the top of the tree a large shoot is produced, which, when boiled, resembles brocoli, but is said to be of a more delicate taste ; and though much liked, is seldom used by the natives, because on cutting it off, the pith is exposed, and the tree dies. Between this cabbage-like shoot and the leaves, there spring several buds, from which, on making an incision, there distils a juice differing little from water, either in the color or consistence. It is the employment of a certain class of men to climb to the top of the trees in the evening, with earthen pots tied to their waists, which they fix there to receive the juice, which is regularly carried away before the sun has had any influence upon it. This liquor is sold at the bazaars by the natives under the name of toddy. It is used for yeast, and forms an excellent substitute. In this state it is drank with avidity, both by the low Europeans and the natives, and is reckoned a cooling and agreeable beverage. After being kept a few hours, it begins to ferment, acquires a sharp taste, and a slight intoxicating quality. By boiling it, a coarse kind of sugar is obtained ; and by distillation, it yields a strong ardent spirit, which being every where sold, and at a low price, constitutes one of the most destructive annoyances to our soldiers. The name given to this pernicious drink by Europeans, is Pariah arrack, from the supposition that it is only drank by the Pariahs, or out-casts, that have no rank.

The trees from which the toddy is drawn do not bear any fruit, on account of the destruction of the buds ; but if the buds be left entire, they produce clusters of the cocoa nut. This nut in the husk is as large as a man's head, and when ripe falls with the least wind. If gathered fresh, it is green on the outside ; the husk and the shell are tender. The shell, when divested of the husk, may be about the size of an ostrich's egg, and is lined with a white pulpy substance, which contains about a pint and a half of a liquor like water ; and though the taste be sweet and agreeable, it is different to that of the toddy.

In proportion as the fruit grows old, the shell hardens, and the liquor diminishes, till it is at last entirely absorbed by the white milky substance, which gradually acquires the hardness of the kernel of the almond.

History, Use, Propagation, Culture,

and is almost as easily detached from the shell. The natives use this nut as their victuals; and from it they also express a considerable quantity of the purest and best lamp oil. The substance which remains after this operation, supplies an excellent food for poultry and hogs. Cups and a variety of excellent utensils are made of the shell.

The husk of the cocoa nut tree is nearly an inch thick, and is, perhaps, the most valuable part of the tree; for it consists of a number of strong fibres, easily separable, which furnish the material for the greatest part of the Indian cordage; but is by no means the only substitute which the country affords for hemp. This the natives work up with much skill.

Plants of the cocoa nut tree are frequent in our stoves, being easily raised from the nuts sold in the shops, planted in rich earth, and on a moist heat; but the plants are seldom allowed room enough to come into flower; though it has been observed, that this is almost the only palm that could be cultivated in this country for perfecting its fruit; all the others being dioecious plants. Sweet observes, that they seldom succeed well in our collections; perhaps from being too much exposed to the sun: he is "informed they thrive best in the shade in the West Indies, where cultivators of them plant tall trees near them for that purpose." (*Bot. Cult.* p. 42.)

C. aculeata has a trunk the thickness of the human body; its pinnæ of the fronds are longer than in the cocoa, and prickly like the bark of the trunk. The fruit is as large as a crab, and of the same shape; under a green skin it has a thin sweetish astringent pulp; and within that, a nut full of a white sweet eatable kernel. The nut is said to yield the true palm oil. The outside of the trunk is made into laths, haws, and darts.

1984. *Elate*. This was one of the names given by the Greeks to the membrane which envelops the female flowers of the date; that is to say, to its spathe. Modern authors have applied the word to a kind of Indian palm. The fruit of *E. sylvēstris* resembles a wild plum. The poorer sort of people chew it in the same manner with the *Areca* nut, with the leaf of the betel pepper and quick-lime. The elephants are fond of the fruit-stalks, which are very sweet. In our stoves the plants require a sandy loam, and a strong heat.

13353 Thorns none, Stem somewhat angular, Stamens much longer than the calyx

13354 Unarmed, Stems angular, Terminal flowers female : lower male ; intermediate hermaphrodite

and Miscellaneous Particulars.

1865. *Bactria*. So called by Jacquin, from $\beta\alpha\kappa\tau\iota\sigma$, a cane, because the small stem is made into walking-sticks, which are much valued. B. minor produces a fruit of a dark purple color, the size of a common cherry, containing an acid juice, of which the Americans make a sort of wine. It is also eaten raw, but is not pleasant. Canes are made of the stem; they are dark-colored, shining, jointed, and very light; the French call them *Canes de Tobago*. B. major has a large nut with a solid kernel, which is eaten in Carthagen. In our stoves they form handsome plants, and grow freely in sandy loam; like other palms, they are only to be increased by seed.

1866. *Ceratophyllum*. So called from $\kappa\epsilon\rho\alpha\varsigma$, a horn, and $\phi\upsilon\lambda\lambda\omicron\varsigma$, a leaf, on account of the numerous horned divisions of the leaves. Aquatic weeds of no beauty.

1867. *Myriophyllum*. From $\mu\upsilon\tau\iota\omicron\varsigma$, a myriad, and $\phi\upsilon\lambda\lambda\omicron\varsigma$, a leaf, on account of the infinite number of divisions of its leaves. Aquatics of some beauty, and the easiest culture.

1868. *Sagittaria*. So called from *sagitta*, an arrow, in reference to the arrow-headed form of the leaves. S. sagittifolia is one of the handsomest of British aquatics, and is common in Siberia, China, Japan, and Virginia. The bulb, which fixes itself in the solid earth below the mud, constitutes an article of food among the Chinese, and upon that account they cultivate it extensively. The roots are larger in those countries than with us. All the species are of common culture.

1869. *Begonia*. Named in honor of Michael Begon, a Frenchman, born in 1638; he was an intendant of Marine, and a promoter of botany. These are universally plants remarkable for the neatness of their foliage, and their succulent habit. B. argyrostigma and discolor are the two most beautiful species. They are all cultivated without difficulty either from seeds or cuttings.

1920. *Poterium*. Literally, this word signifies a drinking vessel, and in the same sense, a kind of beverage. A drink was made of it, which was reckoned useful in many complaints; it is also an ingredient in cool tankards. P. sanguisorba is sometimes sown along with clover as an herbage plant; it is now, however, out of

History, Use, Propagation, Culture,

repute. The leaves when bruised smell like cucumbers, and taste something like the parings of that fruit; they are sometimes put into salads. All the species are of the easiest culture.

1991. *Amiro'la*. A word with an unknown meaning. The Peruvians form the shining black seeds of *Amiro'la nitida* into rosaries.

1992. *Acidoton*. From *ακιδωτος*, pointed; in allusion to the stinging pointed hairs of the leaves.

1993. *Thelygonum*. A name under which Pliny described a plant which appears to have been *Mercurialis*. It was derived from *θηλυς*, a woman, and *γονυ*, a knee, because of its joints, which were thought to resemble a woman's knee. *Cyno-crambe*, literally interpreted dog-cabbage, was the Greek name of *Mercurialis perennis*.

1994. *Castanea*. A native of the territory of Castanea, a town of Thessaly, near the borders of the river Peneus, where magnificent chestnut trees still are found. The chestnut, *Châtaigner*, Fr., *Castanienbaum*, Ger., *Castagno*, Ital., is, like the walnut, both a timber and a fruit tree; some of the oldest trees in the world are of this species; as that mentioned by Brydone on Etna, and the chestnut at Tortworth, in Gloucestershire. The fruit is generally eaten roasted; abroad, it is not only boiled and roasted, but ground into meal, and puddings, cakes, and bread are made from it. The timber is thought to have been formerly in very general use for house carpentry, though some consider what is generally called chestnut in our old buildings as oak. It is one of the best trees for hop poles, and scarcely any other is now planted in Kent and other hop districts for that purpose. Some excellent fruit-bearing varieties have been lately imported from France; these are increased by grafting or budding in the usual methods, but the plants for coppice woods or timber are best raised from nuts. There is a variety with striped leaves which is very ornamental. The most esteemed of the French kinds are called *Marron*, a word which in old French literally signifies a substance, which it must be confessed the fruit is not unlike.

The American chestnut differs so little from the European, that no specific distinction can be drawn. It is one of the largest and most useful trees of the forests, the wood being extremely durable, and in high esteem for posts and rails to construct fences. The nuts are very delicious. The *Castanea pumila* or Chinquapin nut, is a small tree, or rather shrub, growing to the height of thirty feet in the southern states, but scarcely exceeding seven or eight in cold latitudes. The fruit is very sweet and agreeable to eat.

1995. *Ostrya*. So called from *οστρεον*, a scale, in allusion to the scaly catkins of the fruit, which resemble those of the hop, when the plants are called Hop-Hornbeam. The wood of *Ostrya virginica* is exceedingly hard and heavy, whence it is generally known in America under the name of Iron-wood. In some parts it is called Lever-wood.

1996. *Carpinus*. From the Celtic words *car*, wood, and *pin*, the head; that is to say, wood fit for the yokes of cattle. The wood is white, and of a fine close texture, which makes it peculiarly fit to be wrought into the

 13366 Scales of cones 3-parted: middle segment oblique ovate lanceolate 1-toothed on one side
 13367 Scales of cones ovate unequal at base undivided somewhat angular unequally serrated
 13368 Leaves ovate glabrous obsolete dentate, their margins ciliated
 13369 Leaves ovate acuminate downy beneath coarsely toothed ciliated at edge
 13370 Stip. obl. obt. Lvs. roundish-cordate pointed, Invol. of fruit campanulate rather spreading torn at margin

13371 Stip. obl. blunt, Cal. of fruit tubul. cylind. contracted at end cut toothed, Leaves roundish cord. acuminate

and Miscellaneous Particulars.

various forms with which the country people of all nations have delighted to ornament their yokes. Our English word Horn-beam has evidently the same meaning. *C. Betulus* is a tree of little merit or beauty, having persistent leaves like the beech; it is well adapted for hedges or separation, where the object is shelter.

1397. *Fagus*. From the Greek $\varphi\gamma\gamma\omega\varsigma$, which also signifies catable. We all know that mast was the original food of man. The *Fagus* of Virgil, was the *Quercus Esculus*. *Witc*, Fr., *Buche*, Ger., *Faggio*, Ital. *F. sylvatica* is a handsome tree in every stage of its growth. It seems to thrive best in a chalky clay or loam, rather sheltered. It is one of the handsomest single trees for parks, and is well adapted to form lofty hedges. The timber is brittle, and not of long duration; but it is much used by turners, joiners, and mill-wrights. The bark is remarkably thin, and has been used for making baskets and hand-boxes. The leaves are used in France by the country people, on account of their elastic quality, instead of straw for the pailasse to lay under their mattresses. The mast is readily eaten by swine and deer.

F. cuprea, the copper colored, and *F. purpurea*, the purple beech, are two of the most striking of timber trees, from the color of their foliage. They are propagated by grafting, and grow as freely as the common beech.

Fagus ferruginea is distinguished by the Americans from the common kind by the name of Red Beech, the wood being of a darker color.

1398. *Corylus*. From $\kappa\omicron\upsilon\lambda\omicron\varsigma$, a bonnet; to which the enveloping calyx may be very well compared. Our word Hazel is in like manner derived from the Anglo-Saxon *Hazel*, which signifies an head-dress. *Noisette*, Fr., *Nussbaum*, Ger., and *Avellano*, Ital. *C. avellana* has the specific name from Avellino, a city of the kingdom of Naples, near which, in a valley, it grows to a great extent, and in Swinburne's time, brought in an annual profit of near £2,000 sterling. It is said they were originally imported into Italy from Pontus, and known among the Romans by the appellation of *nux Pontica*, which in process of time, was changed into that of *nux Avellana*, from the place where they had been propagated with the greatest success. The common Hazel-nut is wild in many woods and coppices in Britain, whence the fruit is gathered in plenty and sent to the neighbouring markets. As underwood, the plant is of some value for hoops, fishing-rods, walking-sticks, withes for faggoting, crate-making, hurdles, wattling-fences, and springles to fasten down thatch. Formerly the roots were used by the cabinet-makers; and where yeast was scarce, they twisted the twig, steeped them in ale during its fermentation, hung them up to dry, and when they brewed put them into the wort.

There are several varieties of the cultivated filbert. What is called the frizzled filbert is esteemed the best. The plants do not require a rich soil, but one with a dry bottom. They are generally propagated by suckers, and grown as dwarf standards, each plant with a single clean stem, from six feet high down to twelve inches. When allowed to throw up suckers from the root and form a thick bush, they cease to bear fruit in any quantity. The filbert bears principally upon the sides of the upper young branches, and from small shoots which proceed from the bases of side branches cut off the preceding year. Hence the sprurring-in method of

History, Use, Propagation, Culture,

pruning is the most successful in the production of fruit. C. Colurna may be treated in the same manner as the other, but the plants kept at a somewhat greater distance apart.

The nuts of the American Hazel-nut, *Corylus americana*, are very excellent.
 1999. *Juglans*. That is to say, *Jovis glans*, the nut of Jove, on account of its excellence, which must have been great indeed, when gods had nothing but oak or beech-mast to eat. *J. regia*, walnut, from *gaul*-nut, the tree being introduced from France, *Noyer*, Fr., *Walnussbaum*, Ger., and *Noci*, Ital., is cultivated both as a fruit and timber-tree. The fruit in a green state, before the stone hardens, is much used for pickling, and also as an adulteration of soy sauce. An oil, which supplies the place of that of almonds, is expressed from the kernel in France. In Spain they strew the gratings of old and hard nuts, first peeled, into their tartrs and other meats. The leaves strewed on the ground, and left there, annoy worms; or macerated in warm water, afford a liquor, which from its bitterness may effect their death. The unripe fruit is used in medicine for the same purpose. Pliny says, "the more walnuts one eats, with the more ease will he drive worms out of the stomach." The timber is used in this country for gun-stocks, being lighter in proportion to its strength and elasticity than any other. It is used in cabinet-work in most parts of the continent: the young timber is held to make the finest colored work, but the old to be finer variegated for ornament. When propagated for timber, the nut is sown; but when fruit is the object, inarching from the branches of fruit-bearing trees is preferable. Budding has also been successfully adopted by Mr Knight; the buds succeed best when taken from the base of the annual shoots; ordinary-sized buds from the upper parts of such shoots generally fail. Walnut trees that have not been grafted or budded, may be induced to produce blossoms by ringing the bark.

Juglans nigra, the black walnut, is a tree of large size, and its nuts are eaten by men and several species of animals. The wood is put to various mechanical and economical uses. *J. cathartica* is known under the name of butter-nut, oil-nut, and white walnut: the nuts are used by the American Indians medicinally. The fruit of *J. olivæformis*, or the Pekan-nut, is delicious; sometimes it is exposed in the fruiterers' shops for sale. The nuts of *J. sulcata*, which is called thick shell-bark hickory, and Springfield and Gloucester nut, are large and well-tasted. The shell-bark hickory, shag-bark, or scaly-bark hickory, *J. alba*, is so called on account of its bark, which is torn lengthwise in long loose strips, as in *J. sulcata*. The wood of *J. tomentosa*, the Mocker-nut, white-heart hickory, or common hickory, is excellent for mechanical purposes, and particularly esteemed as fire-wood; but the nuts are hard, with but little kernel in them. The Americans make very good and durable brooms by slitting into narrow slips the very tough wood of *J. glabra*, which is called pig or hog-nut, also broom hickory.

 13397 Leaves roundish ellipt. nearly sess. undulated with deep spin. divaricat. teeth densely downy beneath somewhat heart-shaped at the base

and Miscellaneous Particulars.

2000. *Quercus*. This name is derived from the Celtic *quer*, fine, and *cuex*, a tree: it was so called, in distinction to other trees, because the holy misseltoe grew upon it: otherwise the common name of the oak in Celtic was *deru*, whence *druida*, and the Greek *δρυς*. *Phellos* was the Greek name of the cork, *Q. suber*. Gramuntia has derived its name from growing in the wood of Grammont, near Montpelier. *Suber* is generally thought to have been formed from the Latin *sub*, under, because the bark was used by the Roman women as sandals, both for keeping their feet dry, and increasing their stature; but Vossius is of opinion, that it comes from *εὐξαι*, the Greek name of any kind. *Coccifera* has been so called because the little insect, coccus, which affords the well-known kermes dye, is found upon it. Kermes itself is an alteration of *germes*, which signifies in Arabic, a little worm; the same people called the red dye *germesy*, whence our Norman-English word *cramoisy*. *Robur* is an alteration of *rore*, a Celtic synonym of the oak. *Ægilops*, literally goat's-beard, was so called on account of the long truss or beard-like lichens which were frequently found hanging suspended from it.

The oak is a genus of trees familiar to man in the temperate zones of both hemispheres. *Q. Robur*, now valued for its timber and bark, and formerly for its acorns, is familiar to every Briton. There are two distinct varieties or subspecies; *Q. sessiliflora* and *pedunculata*, and another *Q. pubescens*. *Q. pedunculata* is thought to be the common oak of England, being much more frequent in natural woods than the others. The timber of this variety is said to be whitish and hard, while that of the sessile-fruited is reddish and brittle. The bark of this and all the hardy species of oak is or may be used by the tanner. Oak saw-dust is the principal indigenous vegetable used in dyeing fustian; and different shades of drab and brown are also made from it. Oak-apples are used in dyeing as a substitute for galls; the black got from them by the addition of copperas is more beautiful than that from galls, but not so durable. These galls are occasioned by an insect of the Cynips kind, which deposits its eggs in the substance of the leaf. When the bark of the oak has performed its office to the tanner, it is employed by the gardener to produce heat by its fermentation. Oak leaves are also used for the same purpose. When a great proportion of the island was in forest, acorns were of importance for feeding swine; they are still valued for this purpose in districts where the oak abounds, as in Hampshire and Northamptonshire. *Q. cerris* is a very handsome tree, and the timber is considered nearly as valuable as that of the common oak. The Lucombe (from the name of the nurseryman who raised it and Fulham from the name of the nursery where it was first originated) varieties are nearly evergreens; they retain their verdure till Christmas, and remain on the tree in a brown or withered state till April or May following.

Q. coccinea is one of the handsomest of the American oaks; the leaves, which are six inches long, change in

History, Use, Propagation, Culture,

autumn to a beautiful scarlet color, and unless hard frost comes on early, they do not fall off the tree till near Christmas. *Q. rubra* bears a near resemblance to the last species. *Q. tinctoria*, *Quercitron*, Fr., has been recommended to be cultivated on account of its bark, which affords a valuable yellow dye. (*Caled. Hort. Mem.* iii. 378.

Q. suber is cultivated in Spain, Portugal, and the south of France, for its cork-bark. The exterior bark is the cork, which is taken from the tree every eight or ten years; but there is an interior bark which is left on to protect the tree, so that stripping off the outer bark is so far from injuring the trees, that it is necessary to their continuation. Trees that are never barked are said to die at the age of fifty or sixty years. The bark is taken off for the first time when the tree is about fifteen years old; it soon grows again, and may be rebarked three times, the bark improving every time till the tree attains the age of thirty years. It is taken off in sheets or tables, much in the same way as oak or larch bark is taken from the standing trees in this country. After being detached, it is flattened by presenting the convex side to heat, or by pressure. In either case it is charred on both surfaces to close the transverse pores, previously to its being sold. The carbonized surface produced by this charring, may be seen in bungs and taps; but not in corks, which being cut in the lengthway of the wood, the charring is taken off in the rounding.

13398 Leaves elliptic, with deep point, serratures downy beneath, Fruit racemose, Cal. hemispherical, Nut obl.
13399 Lvs. on short stalks obov. acutely and coarsely toothed at base glaucous ben. Cup hemispheric. Acorn ov

C. Leaves sinuated.

- 13400 Leaves oblong mucronate-toothed smooth on each side
13401 Leaves oblong coarsely mucronate-toothed smooth on each side cuneate at base, Branchlets hairy

13409 Lvs. wedge-shaped with 3 terminal bristly-pointed lobes: the midd. one longest downy beneath, Cal. of the fruit flattish, Nut nearly round
13410 Leaves oblong sinuated downy beneath: lobes blunt; upper dilated 2-lobed, Cups hemispherical
13411 Leaves evergreen oblong-lanceolate undivided 3-lobed or sinuated smooth on both sides, Lobes pointed
13412 Lvs. downy ben. sinuat. with 3 or more somew. falc. brist.-point. lobes: term. one elong. jagg. Cal. hemisph. [undern. Nut globose
13413 Lvs. downy ben. obov. obl. dilat. wide. sinuat. Lobes short obt. slight. toothed bristle-point. Cal. of fruit flat
13414 Leaves downy beneath oblong pinnatifid toothed bristle-pointed, Calyx turbinate, Nut ovate
13415 Lvs. smooth obl. sinuat. on long stalks, Lobes ac. sharply tooth. bristle-point. Cal. of fr. flat undern. Nut ov.
13416 Lvs. on long stalks ovate lanc. or obl. entire or unequally lobed, Cup hemispherical, Acorn nearly globose
13417 Lvs. smooth obl. deeply and widely sinuated on long stalks, Cal. of the fruit turbinate $\frac{1}{2}$ as long as the nut
13418 Lvs. smth. obl. wedge-shap. at base deeply and widely sinuat. on short stalks, Cal. of fr. turbin. $\frac{1}{2}$ as long as nut
13419 Lvs. smooth obl. deeply and widely sinuated on long stalks, Forks of the veins densely woolly beneath, Cal. of the fruit flattened, Nut nearly globose
13420 Lvs. obl. lyr. downy ben.: term. lobe very large 3-cleft sinuat. Cal. of fr. hemisph. scaly fring. with bristles
13421 Leaves obovate cuneiform 3-5-lobed, Lobes setaceous mucronate downy beneath [elong. spread. scales
13422 Lvs. ov. obl. with bristle-pointed tooth-like lobes hoary ben. Cal. of fr. very large hemispherical with lanc.
13423 Lvs. obl. deeply pinnatif. glaucous ben. Lobes lin. obl. obt. ent. dilated upw. Fr. stalked, Cal. depress. warty [hemispherical
Leaves slightly lobed green on each side
13424 Lvs. ov. obl. sinuat. smooth paler ben.: segm. bluntish somew. angular at base, Fruit nearly sess. Cal. scaly
13425 Lvs. decidu. oblong smooth dilated upwards stalked, Lobes obtuse, Stalks of fruit elongated, Nut oblong
13426 Leaves oblong subsessile smooth sinuated: lobes round, Fruit oblong stalked [Fruit nearly sessile
13427 Lvs. obl. obov. stalked sinuat. downy ben.: lobes obt. angul. wavy somew. heart-shap. and unequal at base,
13428 Leaves subsessile smooth oblong ovate pinnatifid sinuated blunt, Branches ascending
13429 Leaves softly villous deeply pinnatifid: segm. oblong blunt sinuated, Cups warty [hemisph. bristly
13430 Lvs. on very short stalks obl. deeply and unseq. pinnatif. hairy ben. Stip. longer than footst. Cal. of the fruit

13431 Lvs. on longish stalks ovate obl. slightly but copiously sinuated downy and hoary ben.: lobes short ovate acute entire, Stipules shorter than the footstalks, Cal. of the fruit hemispherical bristly

and Miscellaneous Particulars.

The uses of cork in Britain are well known. It was used as sandals by the Greeks, whence our cork soles, and probably the Venetian choppins (*cioppini*, Ital.), or shoes so high heeled, as to raise the women above the men. The poor people in Spain lay broad planks of it by their bed-side to tread on, as great persons use Turkey and Persian carpets to defend them from the floor; and sometimes they line the walls and insides of their houses built of stone with this bark, which renders them very warm, and corrects the moisture of the air. Both in Spain and Barbary bee-hives are made of cork; for this purpose, they roll the bark into a cylinder of five or six feet long, and six inches in diameter, boring holes for the entrance and exit of the bees, as in the Polish hive. (*Encyc. of Gard.* 1738.)

Q. coccifera, *Cusajo*, Span., has prickly leaves like those of the holly, or *Q. ilex*, from this species is collected the kermes or scarlet grain, a little red gall, occasioned by the puncture of the *Coccus ilicis*. With these galls scarlet color was dyed, till the discovery of America, when another species of *Coccus*, the cochinifer, was found in the Mexican woods upon the *Cactus*.

Q. phellos is remarkable for the form of the leaves, which differ in character from those of the rest of the species. *Q. ilex*, the holly, or holm oak, *Chêne vert*, Fr., *Elice*, Ital., and *Enzina*, Span., is a handsome ever-green tree, and the timber is supposed equal to that of the common oak. *Q. gramuntia* is thought by some

History, Use, Propagation, Culture,

to be only a variety of this species. The acorns of *Q. esculus* are sweet, and, it is said, are frequently eaten by the poor in the south of France: the tree very much resembles the common English oak.

The willow oak grows to the height of about fifty or sixty feet. The *Q. virens*, or live oak, grows to the height of forty or fifty feet, spreading its branches, in open places, extremely wide; it yields the finest and most durable ship-timber of any species known; for which reason it is considered one of the most valuable trees in America. The laurel oak, or, as it is sometimes called, swamp willow oak, is about fifty or sixty feet high; its wood, according to the elder Michaux, is very valuable, and almost preferable to that of *Q. virens*. The water oak, *Q. aquatica*, is about forty feet high when full grown: its wood is but little valued. Its leaves vary according to the soil and age, *ad ignitulum*. There is scarcely one tree found having leaves like the other; and the same tree is almost as variable in its different branches. The downy black oak, *Q. triloba*, is from twenty to forty feet high, according to Michaux, of very rapid growth, and extremely well calculated for inclosing land. The barren oak, or black jack of the Virginians, *Q. nigra*, is of low growth, especially in the more northern states; it bears very abundantly, and furnishes a fine mast for hogs; the wood is small, but excellent for fuel. The black oak, or Quercitron, *Q. tinctoria*, is one of the largest trees of the American forest, and highly valuable on account of its timber as well as bark, which is very superior for tanning to any other oak. *Q. falcata* is a very large tree, commonly called Spanish oak. The wood of the upland white oak, or iron oak, is of great value in ship-building. The fruit of the *Q. Prinus*, known by the name of the chestnut white oak, swamp chestnut oak, and, in the southern states of North America, white oak, is large, and of a sweet taste. The bark of the rock chestnut oak, *Q. montana*, is excellent for tanning. The yellow oak, *Q. castanea*, is a large and beautiful tree with eatable acorns.

2001. *Liquidambar*. From this tree flows a strong balsamic substance, which has been compared to ambergris, and named from *Ambar*, amber, and *liquidum*, fluid. *L. styraciflua*, in its general form and leaves, bears a considerable resemblance to the lesser Maple, (*Acer campestre*) as the wood is good timber and beautifully variegated. Between the wood and the bark issues a fragrant gum, which trickles from the wounded trees, and by the heat of the sun congeals into transparent drops, which the Indians chew as a preservative to their teeth. It smells like the balsam of Tolu. The species are propagated by layers, or from seeds.

The sweet gum-tree, or *Liquidambar styraciflua*, is sometimes found of an immense size, particularly in the southern states; its wood is of an exquisite hard texture and fine grain, and furniture made of it has a handsome appearance.

2002. *Platanus*. From *πλατυς*, ample, broad, in allusion to the shadow afforded by the foliage. The species are trees of peculiar grace and elegance, and from that circumstance, and the classical associations attached to them, they are eminently adapted for pleasure grounds. The Chenar, or eastern plane, is very much employed

- 13432 Leaves oblong sinuate serrated downy beneath, Bark fungous
 13433 Lvs. obl. smooth glaucous ben. deeply and unequally pinnatif. Fruit ellipt.-ovate, Cal. cup-shaped ferrug.
 13434 Lvs. obl. deeply sinuate smooth much contracted in the middle: lobes acute; the upper ones obtuse angular and abrupt, Calyx of the fruit globose mucicated nearly covering the nut
 13435 Leaves palmate-lobed, Recesses at the base of the veins villous
 13436 Leaves palmate-lobed, Recesses at the base of the veins smooth
 13437 Leaves 5-lobed palmate cuneate at base, Segm. lanceolate sinuated, Stipules nearly entire
 13438 Leaves 3-5-lobed toothed cuneate at the base smoothish
 13439 Leaves cordate 5-lobed remotely toothed truncate at base
 13440 Leaves 5 angular obsolete lobed toothed cuneate at base downy beneath

13441 The only species

- 13442 Fronds forked: segments ensiform narrow, Stems round
 13443 Fronds forked: segments lanceolate, Stems channelled
 13444 Fronds flabelliform 3-5-parted

- 13445 Stemless, Leaves pedate entire, Spadix as long as spathe [contracted in the middle-
 13446 Stemless, Lvs. pelt.-cordate sagittate colored in the disk, Spadix shorter than the hooded spathe, which is
 13447 Stemless, Lvs. peltate-cordate sagittate, Spadix longer than the cylindrical spathe sagittate at end
 13448 Stemless, Leaves peltate-cordate, Spadix shorter than ovate-lanceolate spathe
 13449 Stemless, Leaves sagittate acuminate, Spadix shorter than ovate-cucullate spathe
 13450 Stemless, Leaves pinnatifid
 13451 Caulescent suberect, Leaves oblong cuspidate, Spadix shorter than oblong spathe
 13452 Caulescent rooting, Leaves cordate sagittate, Spadix as long as the cucullate ovate spathe
 13453 Caulescent erect, Leaves sagittate, Spadix shorter than the cucullate ovate spathe
 13454 Caulescent rooting, Leaves ternate, Petioles naked, Spadix as long as the cucullate ovate spathe
 13455 Caules. root. Lvs. tern.: lat. leaflets eared at base on outside, Petiol. winged bel. Spad. shorter than spathe
 13456 Caulescent rooting, Leaves cordate sinuate
 13457 Caulescent, Leaves cordate with rounded lobes, Spadix as long as cymbiform spathe
 13458 Caulescent suberect, Leaves oblong acuminate cuspidate cordate at base finely spotted with clear white
 13459 Caulescent scandent, Leaves ovate oblong acuminate, Spadix longer than cucullate spathe
 13460 Caules. erect, Lvs. cord. sagittate, Spadix shorter than spathe, which is cucullate and contracted in middle

and Miscellaneous Particulars.

in the gardens of Persia and India; it was highly esteemed by the Greeks and Romans, and was planted near their houses in the form of avenues and groves. Groves of these trees are still equally revered in India, and are commonly found near the native temples and burial places of the princes. The timber is considered of similar quality to that of sycamore. All the species are of easy culture by layers, and they will also grow by cuttings.

The *Platanus occidentalis* is known in America by the name of the button-wood, water beech, sycamore, and plane-tree; in Canada it is called cotton-tree. It is, perhaps, the largest tree in North America; on the fertile banks of the Ohio and Mississippi there are trees measuring from ten to sixteen feet in diameter.

203. *Salisburia*. So called in honor of Richard Anthony Salisbury, F. R. S., a modern distinguished botanist. A large tree remarkable for its fan-shaped leaves, cloven like some of the *Adiantum* species. The fruit is a pale brown drupe of a globular form; it has never been produced in this country, though there are trees of a considerable size. The fruit is yellow when ripe, with a fleshy, juicy, white pulp, adhering closely to the drupe, which is like that of an apricot. The kernel is white, rather firm, sweet, with a mixture of austerity or bitterness when raw, but agreeable when roasted. Dr. Abel says, he saw the fruit exposed in the markets in China, but could not find out to what purpose it was applied.

204. *Cartudovica*. Named by the authors of the Flora Peruviana, in honor of Charles IV., king of Spain, and Luiza, his queen; both of whom were noble patrons of botany, and deserving of a finer genus to commemorate their virtues. The species are low palm-like herbs, of little beauty, but of great botanical interest.

205. *Caladium*. A name originally employed by Rumphius, to designate some species of *Arum*, and revived by Ventenat. Its meaning is unknown. The species have the appearance of *Arca*, and are only cultivated for their singularly spotted stems, or neat green leaves, which are rarely disfigured by any of the accidents to which other stove plants are liable. The species are plants of the same general appearance as *Arum*. *C. sagittifolium*, *Chou-de-Brcsil*, Fr., and *Essbare Arum*, Ger., bears a near resemblance to *Arum Colocasia*, and is carefully cultivated in the West Indies for the leaves, which are boiled and eaten as cowworts, being extremely pleasing to the taste. The roots are also eaten there, but they are in less esteem than the leaves. This is generally supposed to be the species of the *Arum* family the most universally cultivated. It is found in the East and West Indies, China, Japan, New Zealand, and the South Sea Islands. The root is extremely acrid, and when eaten raw, will excoriate the mouth; but baked in hot ashes, it loses its acrimonious quality, and becomes mild and well tasted; it is, however, heavy on a weak stomach, and is apt to occasion costiveness. The leaves, which are very soft, glaucous, and covered with a very fine silky nap, are used in many places instead of plates and dishes.

History, Use, Propagation, Culture,

2006. *Arum*. Formerly *aron*; supposed to be an ancient Egyptian word by which the *A. colocasia* was known. The last mentioned name is an alteration of its Arabic denomination *gofqás*, according to Forskahl. Perennial herbaceous plants, mostly natives of hot climates. The roots are fleshy, hot, and acrid, but in many species catable; they are generally without stems, and altogether, with the Caladiums, form a very singular family. *A. Draconculus*, *Serpentaire*, Fr., *Drachenwarz*, Ger., and *Dracuncuto*, Ital., is a very remarkable plant; the stalks of the leaves being spotted with brown and purple, like the belly of a snake. The flower, which, like others of the genus, has a very singular appearance, smells so strongly of carrion, that few persons can endure it. It might be used in medicine and domestic economy for the same purposes as *A. maculatum*. *A. Colocasia* has a tuberous thick large oblong root, and leaves resembling those of the water-lily. In Egypt and the Levant, this plant is esteemed a wholesome food, though not very delicate. The roots and petioles are boiled, and the leaves when young are sometimes eaten raw. *A. trilobatum*, and various others, are similarly used in the West Indies. There and in Europe the culture of all the species is of the simplest kind.

A. maculatum, *Gouet*, Fr., *Aronswartzel*, Ger., and *Aro*, Ital., has a tuberous whitish root about the size of a large nutmeg, which is used both as food and medicine. On tasting them, they seem to be merely mucilaginous and insipid, but they soon affect the tongue with a pungency as if pricked by needles; this uneasy sensation may be alleviated by milk, butter, or oil. The acrimony is lost in drying, and the roots become farinaceous, insipid, and fit for boiling or baking. In the Isle of Portland, where the plant is very abundant, the roots are generally eaten by the country people; they are macerated, steeped, and the powder so obtained is dried and sent to London, and sold under the name of Portland sago. Medicinally, the root in its recent state is stimulant, diaphoretic, and expectorant. Though retained in the *Materia Medica*, it is seldom used. The berries which succeed the flower are devoured by birds; and Mr. Curtis thinks, that even the roots are eaten by them, particularly pheasants. Dried and powdered, they are used by the French as a wash for the skin, under the name of cypress powder.

2007. *Caryota*. The Greeks gave this name to a kind of cultivated date. Pliny says, it was so called,

- 13461 Leaves pedate entire, Spadix cylindrical shorter than ovate flat spathe, which is hairy inside
 13462 Leaves pedate entire, Spadix lanceolate shorter than the ovate flat smooth spathe
 13463 Leaves pedate entire, Spadix subulate longer than the oblong convolute spathe
 13464 Leaves pedate entire, Spadix shorter than lanceolate spathe
 13465 Stemless, Leaves ternate entire, Spadix clavate shorter than ovate acuminate flat stalked spathe
 13466 Stemless, Leaves ternate ovate twice as short as spadix
 13467 Stemless, Leaves ternate, Spadix longer than spathe
 13468 Stemless, Leaves peltate ovate repand emarginate at base
 13469 Stemless, Leaves peltate cordate repand 2-parted at base
 13470 Stemless, Leaves cordate hastate, Spadix subulate longer than the reflexed ovate-lanceolate spathe
 13471 Stemless, Leaves sagittate 3-lobed, Flowers sessile
 13472 Leaves all radical hastate-sagittate : lobes deflexed, Spadix club-shaped obtuse shorter than the spathe
 13473 Leaves hastate 3-parted, Spathe stalked 2-colored longer than spadix : the end lanceolate and deflexed
 13474 Stemless, Lvs. veiny with white hastate sagit. : lobes auricled divaricating, Spad. clav. shorter than spathe
 13475 Stemless, Lvs. hastate sagittate mucronate : lobes deflex. Petioles dotted, Spad. cylind. shorter than spathe
 13476 Stemless, Leaves hastate cordate acute : angles obtuse [cucullate spathe
 13477 Stemless, Lvs. hast. sagittate mucron. : lobes deflexed oblong obtuse, Spadix cylind. incurved shorter than
 13478 Stemless, Leaves linear-lanceolate, Spadix subulate longer than lanceolate spathe
 13479 Cauliscent erect, Leaves peltate cordate : auricles cucullate
 13480 Cauliscent suberect, Leaves ovate ligid at base rounded, Spadices axillary
 13481 Cauliscent, Leaves peltate cordate acute cut out at the base with a wide recess
 13482 Leaves sagittate acute rounded at base
 13483 Leaves peltate cordate sagittate, Spathe roundish oblong acute, Spadix obtuse much shorter than spathe
 13484 Leaves lanceolate acute entire, Edge of petiole sheathing, Spathe cucullate
 13485 Leaves peltate cordate
 13486 Cauliscent rooting, Leaves cordate oblong acuminate, Petioles round
 13487 Cauliscent creeping, Leaves cordate lanceolate, Petioles with a membranous edge
 13488 Stemless, Leaves decomposed bulbiferous, Spadix oblong ovate shorter than the obtuse veiny spathe
 13489 Stemless, Leaves linear lanceolate, Spadix lanceolate shorter than the oblong lanc. spirally twisted spathe
 13490 Steml. Lvs. ov. ent. or 3-lob. Spathe urceol. at base : reflex. and taper-point. at end, Spadix length of spathe
- 13491 Unarmed fronds bipinnate, Leaflets cuneiform obliquely bitten off
 13492 Fronds bipinnate, Petioles nodding, Fruit 1-seeded

MONADELPHIA.

- 13493 Frond pinnated, Female flowers terminal capitate : male lateral with dichotomous peduncles

- 13494 Fronds pinnated, Leaflets plaited terminal bitten off, Stems and spadices smooth
 13495 Fronds pinnated, Leaflets cuneiform truncate, Fruit globose ovate acute
 13496 Fronds pinnated, Leaflets linear acute, Fruit oblong incurved

and Miscellaneous Particulars.

because a wine was prepared from it which soon got into the head, *xaca*, head. *C. urens*, a fine species of palm, produces flowers in long pendulous spikes, which are succeeded by strings of succulent globular berries, dark red when ripe, with a thin skin, soft pulp, and very sharp and acrid to the taste. In Ceylon, it yields a sort of liquor, sweet, wholesome, and no stronger than water. It is taken from the tree twice or thrice a day, and an ordinary tree will yield three or four gallons. They boil this liquor, and thus make a kind of brown sugar of it, called Jaggory. The fruit is not eatable. When the tree has come to maturity, there comes out a bud from the top; this bud they cut and prepare by putting salt, pepper, lemons, garlic, leaves, &c. over it, which keep it from ripening. They daily cut off a thin slice from the end, and the liquor drops into a vessel, which they set to catch it. The buds, like those of the Cocoa and Betel-nut, are excellent in taste, resembling walnuts or almonds. *C. mitis* is a very beautiful palm, with fronds four feet long and a branched spike of flowers, succeeded by berries, round, coriaceous, smooth, black, the size of a musket bullet, but not eatable. Both species grow freely in sandy loam.

2088. *Nipa*. The name given to this fine palm in the Moluccas.

2089. *Areca*. The name which this palm bears in Malabar is, when it is an old tree, *Arecc*; when young it is called *Paynga*. A. Catechu produces the nut which is cut in slices, wrapped in the aromatic leaves of the betel-pepper, and chewed as we do toluacco. These leaves are previously covered with a thin layer of shell-lime (Ehunam), to preserve the flavor longer in the mouth. In most parts of the East Indies the natives are continually chewing it, swallowing their saliva tingured with the juice, and spitting out the rest. The inside of their mouths appears as red as blood, and it gives their teeth a dark color: but it preserves the teeth, sweetens the breath, and is a stomachic and diuretic. This palm is very generally cultivated in the East Indies.

A. oleracea is the highest of the American palms, and is very distinct from the East Indian *Areca*. The sheaths of the leaves are very close, and form the green top of the trunk a foot and a half in length. *Tac*

History, Use, Propagation, Culture,

inhabitants cut off this top, take out the white heart of two or three inches in diameter, consisting of the leaves closely folded together, and eat it, either raw with pepper and salt, or fried with butter like the artichoke.

2010. *Belis.* Named by R. A. Salisbury, in the Transactions of the Linnean Society, from *βελος*, a javelin, on account of the form and texture of the leaves, which are not unlike a javelin head. *B. lanceolata* is a beautiful evergreen shrub, with distichous neat leaves, easily cultivated in any good conservatory.

2011. *Agathis.* From *αγαθης*, a cluster, because the flowers are collected in clusters. This genus is formed of the Dammar Pines, of which the *A. australis*, or New Zealand Cowdie Pine, is one of the finest trees in the world, often growing perfectly straight to the height of 100 feet or more, and yielding one of the best descriptions of wood for masts.

2012. *Pinus.* This name is of Celtic origin, and is the same in all the dialects of that tongue. *Pin* or *pen*, a rock or mountain, has given rise to *pin*, in Armorican; *peinge*, in Erse; *pinua*, in Welsh; *pinu*, in Anglo-Saxon; *pinic*, in English; *pynaum*, in German; all signifying the fir-tree: hence also the Appennines (*Alpes pennines*), Pennafiel, Pennafor, &c. towns of Spain embosomed in mountains. The fruit of *P. Pinea* was formerly called *Nux pinea*, the pine nut. *Pinaster* is Pliny's name for the wild pine. *Cembra* is an alteration of the word *cembro* or *cirmoto*, the name given by the inhabitants of Trentin and Valteline to the plant. *Tæda* is derived from the Greek *ταειδα*, which signifies a torch, for which the wood of *P. tæda* is particularly adapted. *Strobis* is a name employed by Pliny for an eastern tree, which was used to perfume apartments. The moderns have applied it to a noble North American species.

The trees which compose this genus are not less remarkable for their grandeur and beauty, than for their valuable timber. They are all evergreens, and of lofty and erect growth. The trunk of the Scotch pine is more generally employed and more universally applicable as timber than any other tree in the temperate zone of the northern hemisphere. *P. sylvestris*, *Pin*, Fr, *Keifer* or *Föhre*, Ger., and *Pina*, Ital., is erroneously called a fir; and has the term Scotch applied to it, because it is the only species of the genus indigenous to Britain, and there only in the northern parts of Scotland. It is also indigenous in the Alps, in the north of Germany, Russia, and abundantly so in Sweden and Norway. The finest pine woods in Britain, are at Invercauld, Inverness-shire, and Gordon Castle in Aberdeenshire. The timber of the Scotch pine is the red or yellow deal of the north of Europe, and is the most durable and valuable of any of the genus, unless we except, in point of durability, the larch. That grown in cold elevated situations in the highlands of Scotland, is found to be not inferior in quality to any imported from Norway; but that which has been planted in the low districts, is greatly inferior in point of durability, and can seldom be used in house carpentry and joinery. The tree is of great value as a nurse plant to others less hardy. The trunk of the tree produces resin by incision, and the roots tar by distillation. Several varieties of the wild pine have been noticed by botanists. According to Saug, the variety commonly cultivated is least worth the trouble. "The *P. sylvestris*, *var. montana*," he says, "is the variety which yields the red wood: even young trees of this sort are said to become red in their wood and full of resin very soon. The late Mr. Don, of Forfar, exhibited specimens of cones of each variety to the Highland Society of Scotland, and likewise to the Caledonian Horticultural Society. The variety preferred by Don, is distinguished by the disposition of its branches, which are remarkable for their horizontal direction, and for a tendency to bend downwards close to the trunk. The leaves are broader and shorter than in the common kind, and are distinguishable at a distance by their much lighter and beautiful glaucous appearance.

- 13477 Fronds pinnated, Stems hirsute, Spadixes branched spiny, Spines incurved
 13478 Fronds pinnated, Leaflets plaited bitten off, Stems and spadixes branched smooth, Fruit roundish gibbous
 13499 Leaves solitary lanceolate flat spreading, Cones round, Scales acuminate
 13500 Leaves elliptical lanceolate striated
 13501 Leaves ovate oblong smooth not striated
 13502 Leaves in pairs rigid, Cones conico-ovate acute as long as the leaves, generally in pairs
 13503 Leaves in pairs, Trunk ascending, Cones ovate erect
 13504 Lvs. twin very long of two forms, Scales narrowed at base very thickened at end not angular
 13505 Leaves twin short acute, Cones ovate conical, Prickles of scales long sulculate incurved: lower reflexed
 13506 Leaves twin divaricating oblique, Cones recurved twisted, Crest of anthers dilated
 13507 Leaves double or triple rigid, Cones oblong generally in pairs rounded at base
 13508 Leaves twin roughish at edge, Cones oblong conical shorter than leaf narrowed at base, Scales echinate
 13509 Leaves twin: the first ciliated, Cones ovate blunt somewhat unarmed longer than leaf, Nuts hard
 13510 Leaves twin very fine, Cones ovate-conical very smooth solitary stalked
 13511 Leaves twin, Cones ovate-conical rounded at base somewhat shorter than leaf, Scales blunt
 13512 Leaves twin, Cones oblong-conical the length of leaves solitary rounded at base, Scales echinate
 13513 Leaves twin, Cones ovate-conical rounded at base solitary half as short as leaves, Scales unarmed
 13514 Leaves twin or ternate, Cones ovate-conical subsolitary, Prickles of scales incurved
 13515 Leaves 5, Cones deflexed: spines inflexed, Sheath of leaves long
 13516 Leaves in 5s very long slender lax toothletted, Cones cylindrical smooth pendulous longer than leaves
 13517 Leaves 3 very long, Cones roundish ovate mucronate
 13518 Leaves 3, Cones ovate clustered, Spines of scales reflexed, Sheath of leaves short

and Miscellaneous Particulars.

The bark of the trunk is smoother than in the common kind. The cones are thicker, and not so much pointed. The plant is more hardy than the common sort, grows freely in almost any soil or situation, and quickly arrives at a considerable size."

P. laricio is said to be nearly allied to the Scotch pine, but a much handsomer and finer tree. Professor Thouin considered it equally hardy with *P. sylvestris*; its wood is more weighty and resinous, and consequently more compact, stronger, and flexible. It grows wild on the summits of the highest mountains in Corsica. *P. resinosa*, the red Canadian pine, is not unlike the Scotch pine, but rather redder in the bark. The timber of this tree is frequently imported as masts, and is considered valuable. Grown on a damp and fertile soil, it is much less durable than from elevated situations; it is equally hardy with *P. sylvestris*. *P. pinaster* is a grand and picturesque tree, and is a great favorite with the Roman and Florentine painters. The timber is of less value than that of any of the others that have been mentioned; in Switzerland it is cut into shingles for covering their houses. It is highly deserving of culture as an ornamental tree, but not for timber.

P. pinea is very common in the south of Italy; there is an immense forest of them at Ravenna, and they are much planted in the gardens of the villas of Rome and Florence. The seeds of this and the last species are eaten throughout Italy, both by the poor and rich. They are as sweet as almonds, but with a slight flavor of turpentine. The wood is not so resinous as that of most of the other sorts, and the tree can only be considered as deserving culture for its pictorial effect. *P. cembra*, the Tannenbaum of Lord Byron (Childe Harold), and the Aphenousli pine of Haarte (Essays), grows higher up the Alps than other pines, and is even found at elevations where the larch will not grow. The wood is very soft, and having scarcely any grain, is very fit for the carver. The peasants of the Tyrol, where this tree abounds, make various sorts of carved works with the wood, which they dispose of in Switzerland among the common people, who are fond of the resinous smell which it exhales.

P. taeda has longer leaves than the wild pine, and larger cones than *P. pinea*; the timber is like that of the Scotch pine, but has more resin. There are a number of these trees at Woburn Abbey, which grow as freely as the Scotch pine, and the timber, as far as it has been tried, is superior.

P. palustris is remarkable for the length of its leaves, which often exceed a foot, and hang down in tufts at the end of the branches, having a singular appearance. It grows in a warmer climate than most other pines; produces a valuable timber in America, but has been but little cultivated in this country. *P. strobus* forms the connecting link between the pine and the larch tribe, and is the tallest tree of the genus. The bark is smooth and elegant, and the leaves numerous, soft, and of a bluish green. The timber is imported in vast quantities under the name of white pine; it is much used in house carpentry, but is considered less durable than the red deal of Norway (*P. sylvestris*), or the pitch pine of Canada (*P. resinosa*). The tree seems to be of so delicate a habit, as to prevent our expecting it ever to become very large or valuable in Britain. It has been a good deal cultivated, having formerly been supposed the most valuable tree of the genus, next to the common pine.

The *Pinus canariensis* seems never to have been well described or understood. Some have taken it for the *Pinus Larix*, others for the *Pinus taeda*, whilst others had confounded it with the *Pinus maritima*. Von Buch, and the late Christian Smith, named it in their catalogue of the vegetation of Teneriff, *Pinus canariensis*, and they state, that it inhabits that island from the edge of the sea to an elevation of 6760 Parisian feet above the level of the sea; but that the region where it is most abundant may be reckoned at from 4050

History, Use, Propagation, Culture,

to 5000 feet, where snow falls for about a month. The temperature of the zone M. Decandolle estimates to be similar to that of Scotland, or to the north of France, or of Germany. The wood is resinous, highly inflammable, and is excellent for constructing buildings, being known to continue sound for ages.

The Pinus mops, Jersey pine, pitch or scrub pine, is of middle size, straggling growth, and full of resin. Its branches are tougher than those of any other pine, and might be used for many purposes if its wood were not subject to so early a decay. The pitch pine, P. resinosa, is generally known in its native country by the name of Norway pine; sometimes, particularly among the Canadian French, red pine. It grows in close forests, is very tall, and its bark remarkably smooth and red; the timber is very heavy; for which reason it is rejected for masts, though its shape and size appear to recommend it for that purpose. The scrub pine, P. Banksiana, is a small straggling tree, which in some instances, when growing among barren rocks, does not rise above five or eight feet high, though it will grow to a considerable size when by accident or culture it is brought on good soil; trees of this species now in England exude a great quantity of resin from their branches. The yellow pine, P. variabilis, is most in use for building houses as well as shipping. P. taeda, the loblolly or Oldfield pine, is found in large tracts in the southern states of North America; all the woods seem to be filled with its seeds; for when any piece of cleared land is neglected for any space of time, it will be covered with these pines. It is difficult, and in some cases almost impracticable, to recover lands so run over, as the ground appears to have lost all fertile properties for other vegetation. The long leaved, yellow, pitch, or brown pine, P. palustris, is a beautiful as well as very useful tree. The white or Weymouth pine grows in the state of Vermont to an enormous size; it is the best timber in America for masts.

2013. *Abies*. According to Bullet, this name is derived from one of the dialects of the Celtic, *abeton*, whence *abete*, Italian, *abeto*, Spanish, &c. Heschius, the Greek grammarian, calls it *αβειν*.

Abies communis, *Sapin*, Fr., *Fichtenbaum*, Ger., and *Abiete*, Ital., is one of the tallest of European firs, with a very straight but not thick trunk. It is a native of the north of Germany and Russia, and particularly abundant in Norway; its timber being the white deal, and, at an earlier age, the long spars imported from that country and the Baltic. The timber is inferior to that of the common pine in durability and bulk; and being often knotty, is not proportionally strong for horizontal bearings with that timber. White Norway deal, however, is used for a great variety of purposes in building; and the entire trees are more prized than any other for masts for small craft, for spars both for marine purposes and on land. What constitutes the value of this fir is, that its timber is equally durable at any age, like that of the larch; and what renders it peculiarly adapted for masts, spars, scaffolding, poles, &c. is its habit, almost in every case, whether standing single or detached, of growing perfectly erect and straight. The tree may be cut for rods, stakes, and scythes, or other implement handles, when the trunk at the base is not more than two inches in diameter, and the bark being kept on it, it will prove almost as durable as the larch. Pontey whole, that poles of spruce are so far inferior to those of larch, that they are more apt to crack when exposed wholly to the influence of the sun and air; but in all other respects they are nearly equal to it, and in straightness surpass it. The tree is peculiarly valuable as a nurse, from being evergreen and closely covered with branches, by which radiated heat is retained; from its conical shape and rigid stem, by which it does not suffocate or whip the adjoining trees; from its being valuable at whatever age it is thinned out; and from its being an excellent shelter for the most valuable game. It will not, however, grow in elevated situations, where the common pine and larch will flourish. It is also an excellent hedge plant for shelter, but is deficient in point of defence and durability. By incision, it yields a resin, from which, by various preparations, turpentine and Burgundy pitch are formed. The tops or sprouts give the flavor to what is called spruce beer.

A. alba, *rubra*, and *nigra*, are American firs of the spruce kind, resembling in their general properties those of Europe. The black spruce is reckoned the most durable; in America it is used for knees for ship-building, where neither oak nor larch can be easily obtained. These knees are not prepared from two diverging branches, as in the oak, but from a portion of the base of the trunk connected with one of the largest diverging roots. The timber of the red spruce is universally preferred throughout the United States for sail yards, and, indeed, imported for this purpose into Liverpool from Nova Scotia, where it is also used for constructing casks for salted fish. It is chiefly from the decoction in water of young shoots of the black spruce, and not exclusively from those of the white species, as supposed by Lambert, that the celebrated beer is prepared by fermentation, with a due proportion of sugar and molasses. The essence of spruce of the dealers is prepared by evaporating this decoction to the consistence of honey.

A. picea displays a more stately and majestic form than any of the firs. The upper surface of the leaves is of a fine vivid green, and their under surface has two white lines running lengthwise on each side of the

- 13519 Leaves 3 very long, Cones subcylindrical muricated, Stipules pinnatifid ragged persistent
 13520 Lvs very fine and slender of a bright glaucous green, Cones oblong pendulous, Scales obtuse spreading
 13521 Leaves 3 very fine very long, Sheath long, Stipules entire deciduous, Crest of anthers convex entire
 13522 Leaves quinate, Cones cylindrical longer than leaf lax
 13523 Leaves quinate, Cones ovate obtuse, Scales appressed, Nuts hard

- 13524 Leaves solitary glaucous beneath emarginate, Cones ovate obl. erect, Bractes oblong reflexed emarginate
 13525 Leaves solitary flat emarginate pectinate, Scales of cone very blunt appressed

 13528 Leaves solitary 4-cornered, Cones ovate cylindrical, Scales rhomboid
 13529 This is a stunted variety of *Abies communis*
 13530 Leaves solitary 4-cornered, Cones cylindrical, Scales rhomboid flattened repand at end eroded
 13531 Leaves solitary 4-cornered incurved, Cones subcylindrical lax, Scales obovate entire

and Miscellaneous Particulars.

midrib, giving the leaves that silvery look which has given rise to the name. The timber is reckoned much inferior in value to that of the common pine, or of the white spruce. It should not be cut till after forty or fifty years growth; at this age, if it has grown in a sheltered rocky steep or doli, it will be found to have produced a great bulk of timber. It is more prolific in resinous matter than any other tree of the fir kind.

A. balsamea is a tree of more delicate habits than the silver fir: its timber is of little value, and the balsam or resin procured from it possesses no medicinal properties superior to those of common turpentine. During summer, the tree sends out a pleasing terebinthine odor.

A. canadensis is a drooping low evergreen tree, elegant in appearance, and valuable as growing under the shade or drip of other trees.

All the species of the pine, fir, and larch families, with the exception of one or two, as yet rare in this country, are raised from seeds. The cones are gathered in the winter season, and exposed to the sun, or to a gentle heat on a kiln, in order to facilitate the separation of the seeds. The cones of the cedar should be kept for a year at least after they are taken from the tree, before the seed be attempted to be taken out. This is necessary on account of the soft nature of the seeds, and the great quantity of resinous matter which the cones contain when growing, and which is discharged by keeping. Cedar cones are generally imported from the Levant, and the seeds retain their vegetative powers for many years. The cones of the Scotch pine, spruce, and larch, are the principal kinds which are opened by kiln heat. The cones of the Weymouth pine, silver fir, and balsam of Gilead fir, give out their seeds with very little trouble. April is the best season for sowing all the species. The soil should be soft and rich, well mellowed by the preceding winter's frost and snow, carefully dug and raked with a long toothed rake as finely as possible. The rarer sorts are generally sown in pots, but the more common in beds. The manner of sowing is by first drawing off the surface of the bed to the depth of half an inch; then drawing a light roller along it to render the surface perfectly even; next depositing the seed; and afterwards replacing the earth drawn off with a space as evenly as possible. This is what is technically called *bedding in*, and is one of the nicest operations of nursery culture. The seed of the Scotch pine and Pinaster require a covering of half an inch in depth; those of the Weymouth pine, three quarters of an inch; and those of the stone pine, an inch and a quarter. The Cedar is generally sown in broad pots, or boxes of light sandy loam, and covered half an inch. The seeds of the larch require a covering of only a quarter of an inch; those of the spruce fir, an inch; those of the silver fir and balsam of Gilead fir, from half to three quarters of an inch. The seeds of the American spruce fir are smaller than those of any of the preceding kinds, and therefore require a lighter covering than any of them; one-fifth of an inch is quite sufficient. The strictest attention is required, both in regard to quality of soil, and thickness of covering the seed; for though resinous trees are extremely hardy when grown up, yet they are all very tender in infancy. In sowing the seed, a considerable loss will be sustained by the smothering of young plants if it is deposited too thick, and by the want of plants if too thin. The judicious gardener will be regulated by the goodness of the seed, and the size of the foliage of the different species. The raising regular crops of the pine family is reckoned a master piece of nursery culture in the open ground; and as it has been most extensively practised in the Scotch nurseries, it is generally considered as best understood there. (See *Sang. Plant. Kat.*)

The pine, fir, and larch families benefit less by transplanting in the nursery than the non-resinous trees. And in general, where circumstances admit, the better plan is to remove them at once from the seed-bed at two years old, to where they are finally to remain. The more delicate species, including the cedar and most of the pines, are best transplanted into pots, unless they can be pined at once where they are to remain. The more common pines and firs are transplanted at two years of age into nursery lines, about the middle of April for all the true, excepting the larch, which, being deciduous, should be transplanted in February. No description of tree-plants receive so much injury as this tree from the loss of roots, from the roots being exposed to the air by being kept long out of the soil, or from compression and exclusion of air and moisture by being kept in close bundles, or thick layers. They should, therefore, be finally planted as soon as possible after removal from the nursery; and, indeed, whenever it is practicable, no more should be taken up in one day than can be planted that day or the next. Nor are any plants more easily deprived of the vital principle, by packing and carriage either by sea or land; though, being all evergreens, excepting the larch, they do not readily show it. This has been stated to us by experienced planters in Wales and different parts of England, as the reason why so few trees are finally produced from the immense numbers of Scotch pine and larch fir annually sent to the south by the Scotch nurserymen.

Abies Balsamea forms an elegant tree forty or fifty feet high. It grows in high and cold situations in the northern states of North America, where it is called balsam of Gilead fir, fir balsam, and American silver fir.

History, Use, Propagation, Culture,

The hemlock spruce is a very elegant tree, and grows in some situations to an enormous size: its bark is a fine substitute for oak-bark in tanning.

2014. *Larix*. This has also for its root the Celtic word *lar*, which signifies fat, in allusion to the abundance of resin afforded by the plant. Even Dioscorides remarks, that *Larix* is the Gallic name for resin. The authors of the Dictionary of Trevoux make the word *Cedrus* come from *κεδρεος*, sweet-scented, on account of the balsamic odor exhaled by the wood when burned.

L. Cedrus, *Cèdre*, Fr., *Cederbaum*, Ger., and *Cedro*, Ital., is unquestionably the most celebrated tree of the genus, and not less remarkable for the irregular grandeur of its form. The general character of its shoot, even when the tree is young, is singularly bold and picturesque, and quite different from that of every other species of the tribe. It is a native of the coldest parts of the mountains of Libanus, Amanus, and Taurus; but it is not now to be found in those places in great numbers. Maudrell, in his journey from Aleppo to Jerusalem, in 1806, could reckon only sixteen large trees, though many small ones; one of the largest was twelve yards six inches in the spread of its boughs. The forest of Libanus never seems to have recovered the havoc made by Solomon's forty score thousand hewers: so that we have now, as Professor Martyn observes, probably more cedars in England than there are in Palestine.

From the branching head of this tree, and its aversion to pruning, it is not likely ever to become valuable as timber in this country. When planted for that purpose, it should, as Sang recommends, be sown in groves, and thus by proximity drawn up with few branches. Much has been said of cedar timber, which borders on the miraculous; as far as experience has gone, it is greatly inferior to that of the common larch, or the wild pine. The great use of the cedar is to plant singly on lawns, or in the margin of plantations, where one or two specimens will give force and character to the dullest front of round-headed trees.

L. Communis, *Mètze*, Fr., *Lerchenbaum*, Ger., and *Laricio*, Ital., is a deciduous tree, and there are two or three species or varieties not yet distinctly ascertained. There is a variety with red and another with white flowers; one with cinerous bark, called the Russian larch, and one with pendulous branches. *L. pendula* and *L. microcarpa* are considered species or subspecies; the timber of both is said to be harder than that of the common white larch; but these trees have never yet had a fair trial in this country. As there are a few large specimens at Dunkeld and Athol, seeds will probably soon be obtained, and from their progeny a practical estimate may be formed of their merits in this country. The red larch trees on the Athol estates do not contain one-third as many cubic feet of timber as the white larch of the same age. The wood is so ponderous that it will scarcely swim on water. (*Hort. Trans.* iv. 416.) The timber of the white larch has been as much extolled as that of the cedar, and with much more reason. The rapidity of its growth is not less remarkable than the durability of the timber. Both have been experimentally proved in the Highlands of Scotland. It is stated by the Duke of Athol, that on mountainous tracts there, at an elevation of 1500 or 1600 feet, the larch, at eighty years of age, has arrived at a size to produce six loads (300 cubic feet) of timber; appearing in durability and every other quality to be likely to answer every purpose both of civil and naval architecture (*Hort. Trans.* iv. 416.) The tree will arrive at a timber size in almost any situation or soil. Sang, a forest manager of extensive practice, has paid great attention to this tree. "It bears," he says, "the ascendancy over the Scotch pine in the following important circumstances: that it brings double the price, at least, per measurable foot; that it will arrive at a useful timber size in one-half, or a third part of the time, in general, which the pine requires; and, above all, that the timber of the larch, at thirty or forty years old,

- 13532 Leaves solitary subulate, Cones oblong blunt, Scales rounded somewhat 2-lobed entire at edge
 13533 Leaves solitary 4-cornered erect straight, Cones ovate, Scales elliptical wavy at edge erect

- 13534 Leaves fasciated deciduous, Cones ovate-oblong, Edges of scales reflexed lacerated, Bractes panduriform
 13535 Leaves fasciated deciduous, Cones oblong, Edges of scales inflexed, Bractes panduriform sharply acuminate
 13536 Leaves fasciated deciduous, Cones roundish few-fl. Scales reflexed, Bractes panduriform bluntly acuminate
 13537 Leaves fasciated rigid evergreen acute, Cones roundish, Scales truncate appressed

13538 Leaves distichous spreading

- 13539 Leaves solitary lanceolate remote
 13540 Leaves whorled linear falcate
 13541 Leaves lanceolate, Branches whorled
 13542 Leaves solitary linear cuspidate remote

13543 Branches quadrang. Lvs. imbric. in 4 rows blunt appr. convex, Cones glob. Scales unarm. Branches straight

- 13544 Branches quadrang. Lvs. imbric. in 4 rows appr. glauc. keel. Cones subglob. Sc. mucron. Branches pendulous
 13545 Branches compressed, Leaves imbricated 4 ways ovate warted at base
 13546 Leaves linear much spreading decussate
 13547 Leaves linear crossing appressed, Branches very slender

- 13548 Branches 2-edged, Leaves imbricated in 4 rows ovate rhomboid appressed naked warted, Cones obovate
 13549 Branches 2-edged, Lvs. imbricat. in 4 rows ovate rhomboid appressed furrowed in middle, Cones elliptical

and Miscellaneous Particulars.

when it has been planted in a soil and climate adapted to the production of perfect timber, is in every respect superior in quality to that of the pine at 100 years old. In short, it is probable, that the larch will supersede the Scotch pine in most situations in this island, at no very distant period."

The chief objections to the timber of the larch are its liability to warp and twist; but this Monteath and others have proved may be effectually prevented by barking the trees in spring while growing, and not cutting them down till the following autumn, or even for a year afterwards. This is also said to prevent the timber from being attacked by the dry rot. The bark of the larch is more than half as valuable as that of the oak in tanning; turpentine is extracted from it in the Tyrol by incision; but that being always injurious to the timber, can never be recommended for adoption in this country. (See *Encyc. of Gard.* 7053. *Monteath's Forester's Guide*, 2d edit. p. 231.)

Like all other trees, and especially the resinous tribe, the timber of the larch is much affected by climate and soil. A certain elevation of surface, coldness of climate, and inferiority of soil, is absolutely necessary to produce the timber in perfection. Sang has known it in many places make the most rapid progress for thirty or thirty-five years, and though there was no external signs of disorder, yet when it was felled, the wood had begun to rot in the hearts of the trees, and some were quite hollow a good way upwards. (*Plant. Kal.* 59.)

Larix pendula, black larch, *Tamarack* or *Hackmatack* of the Americans, is a beautiful tree, resembling the European larch in appearance, as well as in the excellent qualities of its wood and bark.

2015. *Schubertia*. Named in honor of M. Schubert, a Polish botanist. The deciduous cypress grows in extensive swamps, and on the banks of large rivers, from Indian river, Delaware, to Florida, and on the Mississippi; it is one of the largest trees of the new continent, and one of the most valuable timbers that country produces; it grows to a considerable height in this country, though the extremities of the young shoots are almost every autumn destroyed by frost. The finest specimens are at Lion-house and Blenheim.

2016. *Podocarpus*. From *πυξ τοδος*, a foot, and *καρπος*, fruit; in allusion to the stalk of the fruit. The species are increased by ripened cuttings in sand under a hand-glass

2017. *Cupressus*. In Greek *κυπαρισσος*, from the isle of Cyprus, where this tree is very abundant. *Cupressus sempervirens* is a common timber tree in some parts of the Levant. It was employed by the Moors round their palaces, and both by the ancient and modern Romans in their villas and gardens. The timber of this tree is said to resist the worm, and to be of great durability. The doors of St. Peter's church at Rome were formed of this material, and have lasted eleven hundred years. The Greeks made their coffins of it; and the mummy chests of Egypt are many of them of this wood. In Crete, Malta, and other places, it is used for the common purposes of building, and when imported into this country it is employed by the cabinet-maker and turner. Near buildings, where the prevailing architectural lines are horizontal, it forms very suitable combinations; it is also considered an appropriate tree for burial places. *C. Thuyoides* is an abundant tree in the swamps of New Jersey and Pennsylvania. It is used for fencing and house-building, and is in the highest esteem for shingles and pipe staves. *C. lusitanica* is a native both of Goa and Japan, and the handsomest tree of the genus. It is easily distinguished from all the evergreens of the Coniferae by its abundance of very long dichotomous pendent branchlets. The culture of the hardy species of this genus, and also of *Thuja*, is the same as that of *Pinus*.

2018. *Thuja*. An alteration of *thya*, its real name; from *θυω*, to sacrifice. Its wood, which gives out when burnt an agreeable perfume, was used in sacrifices. *Thuja occidentalis*, *Cedre blanc*, Fr., is a well known

History, Use, Propagation, Culture,

popular evergreen, which, though it seldom rises above the height of a shrub here, yet in Upper Canada attains the height of a timber tree, and the wood is considered more durable than any other. The trunk is sawn up into planks and boards for houses and boat-building, and the branches used for posts and fencing. The smaller branches and spray form besoms, and the leaves, made into a salve, are used by the Indians to cure the rheumatism. In England, the timber has been chiefly employed by the turner and cabinet-maker. In its native country the Arbor-vite succeeds best in soils where the roots have abundance of moisture. It grows tallest in swamps and marshes; in very dry places it never comes to any degree of perfection. The first tree of this species sent to Europe, was planted in the royal garden of Fontainebleau, in the reign of Francis the first. T. orientalis is a shrub resembling the other in general appearance. Both these species are readily increased by seeds, cuttings, or layers.

2019. *Trichosanthes*. From $\tau\rho\iota\chi\omicron\varsigma$, hair, and $\alpha\nu\tau\omicron\varsigma$, a flower. The limb of the flower is divided into ten parts, of which the five outer are reversed and acute, the five interior ciliated. T. Anguina is a popular annual, with the habit of the common cucumber. The flowers are cut into many small threads, and the fruit is taper, and nearly a foot long. T. cucumerina has smooth fruit of a red or orange color, the size of a pear. In the popular medicine of Malabar, the seeds are used for disorders of the stomach and bowels. Culture as for the common gourd.

2020. *Momordica*. From *mordeo*, *momordi*, to chew; its seeds have an irregular rugose surface, and the appearance of having been chewed. M. elaterium has a large fleshy perennial root, somewhat like that of Bryony. The stems are thick, rough, trailing, branching, with rough leaves on long footstalks. The fruit is an inch and a half in length, swelling like a cucumber, of a grey color like the leaves, and covered with short prickles. When fully ripe, it quits the peduncles, and casts out the seed and juice with great force and to a considerable distance through the hole in the base, where the footstalk is inserted. For medicinal use, the fruit is gathered in September, just before it is ripe; and the clear juice which runs from it and that obtained by the expression of the fruit are misapplied, and form the elaterium of the shops. This fruit is a very violent cathartic. It was much employed by the ancients, who regarded every part of the plant as purgative; but Dr. Clutterbuck has proved that this is an error. (*Thomson's Lond. Disp.* 3. 8.)

M. balsamina has a fleshy ovate fruit, remotely tubercled in longitudinal rows, smooth in the other parts, red when ripe, bursting irregularly, and dispersing the seeds with a spring. This fruit in Syria is famous for curing gonorrhoea. They cut it open when unripe, and infuse it in sweet oil, exposed to the sun for some days, until the oil is become red. It may then be applied to a fresh wound dropped on cotton. M. operculata has a green fruit, the top of which falls off when it is ripe like a lid; within it has no pulp, but is dry, and filled with netted fibres, very much interwoven.

2021. *Cucurbita*. A Latin word signifying a vessel. It is said to be derived from the Celtic *cuce*, a hollow thing. C. lagenaria has a fruit shaped like a bottle, with a large round sh belly, and a neck very smooth; when ripe of a pale yellow color, some near six feet long and eighteen inches round; the rind becoming hard, and being dried contains water; seeds quadrangular oblong, cut off and emarginate at top, three-cornered and beaked at bottom; edge keeled with a double raised line, smoothish, of a pale bay color. The Arabians call the bottle gourd *Unarah*. The poor people eat it boiled, with vinegar, or fill the shell with rice and meat, and thus make a kind of pudding of it. It grows in all parts of Egypt and in Arabia, wherever the mountains are covered with rich soil. In Jamaica, the shells are generally used for water cups, and frequently serve for bottles among the negroes and poorer sort of white people in the country. A decoction of the leaves

13550 Branches compressed, Lvs. imbricated in 4 rows lanc. acute appressed warded under end, Cones 4-cornered
 13551 Branches round, Leaves imbricated in 4 rows oblong appressed smooth, Cones 4-cornered roundish

13552 Fruit rounded oblong incurved, Leaves cordate repand mucronate toothletted

13553 Fruit ovate acute, Leaves roundish cordate angular repand

13554 Fruit oblong acute, Leaves 5-lobed palmated entire

13555 Fruit roundish ovate narrowed at each end angul. warded, Bract cordate toothed above midd. of pedunc.

13556 Fruit oblong acuminate angular warded, Bract cordate entire below the middle of the peduncle

13557 Fruit elliptical angular warded beaked, Beak deciduous forming a lid

13558 Fruit cylindrical oblong, Furrows chain-like, Bract cordate entire at the base of the peduncle

13559 Fruit elliptical hispid, Leaves cordate hispid blunt toothed, Stem without tendrils

13560 Leaves cordate angular 5-lobed toothletted downy, Fruit obovate striped with lines lengthwise

13561 Leaves cordate roundish obtuse downy toothletted with 2 glands at base beneath, Fruit woody clavate

13562 Leaves subcoriaceous about 3-lobed cuspidate finely toothletted rough, Fruit globose smooth

13563 Leaves coriaceous obtuse about 5-lobed toothletted, Fruit roundish or oblong smooth

13564 Leaves cordate deeply 5-lobed: the middle lobe narrowed at base, Fruit roundish elliptical warded

13565 Leaves cordate deeply 5-lobed: middle lobe narrowed at base toothletted, Fruit clav. ellipt. somew. warded

13566 Leaves cordate obtuse about 5-lobed toothletted, Fruit depressed umbonate tumid at edge

13567 Leaves 5-lobed, Lobes sinuate pinnatifid blunt, Fruit elliptical smooth

13568 Leaves multifid, Fruit globose smooth

13569 Leaves cordate 5-lobed toothletted blunt, Fruit globose spiny mucronated

13570 Leaves palmate sinuated, Fruit round echinate

13571 Fruit oval echinate, Leaves palmate sinuated, Stem angular

and Miscellaneous Particulars.

is recommended much in purging clysters; and the pulp of the fruit is often employed in resolute poultices: it is bitter and purgative, and may be used instead of Coloquintida.

C. pepo, *Patisson*, Fr., has hispid branchy tendrils stems, which in good soil will extend forty or fifty feet in a season, and cover an eighth part of an acre. The fruit is oblong, ovate, varying in form and size; some not less than four feet in circumference: in some parts of England the pompon (corruptly pumpkin) is sometimes planted by cottagers on dunghills, and suffered to trail at length over the grass of an orchard. When the fruit is ripe, they cut a hole on one side, and having taken out the seeds, fill the void space with sliced apples, adding a little sugar and spice, and then, having baked the whole, eat it with butter, under the name of pumpkin pie. On the continent the fruit, both unripe and ripe, is used in soups, stews, and fried in oil or butter. The tender tops of the shoots boiled as greens are much more delicate than the fruit. *C. aurantia* is more tender than the common pompon. The fruit is small, round, of a bright yellow when ripe, and may be used like those of the other species. *C. verrucosa* has a small round fruit, with a woody rind. In America it is gathered when half grown, and boiled to eat as a substitute for greens; but for this purpose this and most of the species are inferior to the succale Gourd.

C. melopepo, *Potiron*, Fr., *Pfebin Kürbiss*, Ger., and *Popone*, Ital., has a large fruit, reddish yellow or yellowish-white within and without, roundish, but often flattened at top and bottom; torulose, and sometimes warded. It is cultivated in America as a culinary vegetable. *C. Citrullus*, *Pastèque*, Fr., *Wassermelone*, Ger., and *Cocomero*, Ital., is readily distinguished from all the other species by its deeply cut leaves. The fruit is roundish, large, smooth, often a foot and a half in length, with a white icy flesh, streaked with dark red and black seeds. It is much cultivated: in the warm countries of Europe, and also in Asia, Africa, and America, for its cooling quality. It serves the Egyptians for meat, drink, and physic. It is eaten in abundance during the season, which is from the beginning of May until the overflowing of the Nile; that is, to the end of July or beginning of August. It is the only medicine the common people use in ardent fevers. For this purpose they have a variety that is softer and more juicy than the common sort: when this is very ripe, or almost putrid, they collect the juice, and mix it with rose-water and a little sugar. This fruit should be eaten by Europeans with great caution; when taken in the heat of the day, whilst the body is warm, colics and other bad consequences often ensue, and it is well known that persons are much troubled with worms at the time this fruit is in season.

The Succale Gourd, a variety of *C. ovifera*, has an elliptic oblong pale-yellow fruit, by far the best for culinary purposes of any species of the genus. When very young, it is good triued with butter; when about half grown, it is excellent either boiled as a substitute for greens, or stewed in slices with rich sauce; when full grown, it is used for pies. Salme, who has cultivated most species of Cucurbita, considers the vegetable marrow without a rival (*Hort. Trans.* vol. ii. 255)

All the species may be raised on a hot-bed in April, and transferred to the open garden at the end of May, under a warm aspect and in a rich soil; or they may be sown in a trench filled with hot dung, where they are finally to remain. Their after culture is of the easiest description.

It is not very generally known, that the tender tops of all the species of the Cucurbita and Cucumis families, whose fruit may be eaten, when boiled form a very tender substitute for greens.

2722. *Cucumis*. A word with the same derivation as the last. *C. colocynthis* has fruit the size and color of orange; the pulp light, spongy, and white, and most intolerably bitter. When ripe, it is peeled and dried in a stove, and in this state it is imported from the Mediterranean under the name of coloquintida. Medicinally, it

History, Use, Propagation, Culture,

is a very powerful drastic cathartic, requiring to be employed with caution, on account of its violent effects. When given alone, even in moderate doses, it purges vehemently, producing violent gripings, bloody ejections, and not infrequently convulsions and inflammations of the bowels. (*Thom. Lond. Di p. 271.*)

C. sativus and Melo (*melon*, an apple) are too well known to require farther notice in a work of this description. C. anguria has hispid angular stems, and small flowers like those of Bryony. The fruit is of the size and shape of a pullet's egg, of a dark-green color, and prickly like a hedgehog. It is eaten green, or with other herbs in soups in the West India Islands, and is esteemed an agreeable and wholesome ingredient. C. prope-tarium has a striped fruit smaller than a melon; the odor nauseous, and the taste as bitter as Coloquintida. The fruit of C. acutangulus is very insipid, but in India is eaten boiled and pickled. C. Chate has a roundish fruit almost like that of the melon; the taste is somewhat sweet and cool, but not so cool as the water melon. In Egypt it is eaten as the most pleasant fruit they have, and that from which delicate persons have least to apprehend. The culture of all the species is similar to that of the common cucumber.

2023. *Sicyos*. Σικυος was one of the Greek names of the cucumber, from σικκος, unpleasant. The species are trailing plants like those of Cucumis, but with much smaller fruits.

2024. *Bryonia*. From βρυον, to push or grow rapidly, in allusion to the manner of its growth. B. alba and dioica, differ in little else besides the color of the berries, and by some are considered one species. Goats are

- 13572 Leaves roundish angular, Fruit with 10 acute angles
 13573 Angles of leaves rounded, Fruit torulose
 13574 Angles of leaves rounded, Fruit spherical with a retuse nipple
 13575 Hirsute, Angles of leaves entire toothed, Fruit fusiform narrowed at each end hairy
 13576 Leaves cordate subangular acutish finely toothed scabrous, Fruit elliptical blunt downy
 13577 Angles of leaves straight, Fruit oblong rough
 13578 Leaves angular somewhat lobed, Fruit cylindrical furrowed curved
 13579 Leaves lobed, Fruit cylindrical very long smooth doubled up
 13580 Leaves cordate entire toothletted, Fruit globose smooth

- 13581 Leaves cordate with an obtuse angle, 5-angular toothletted smooth
 13582 Leaves roundish-cordate with a recess 5-lobed toothed hairy viscid

- 13583 Leaves cordate angular toothed rough with callous dots above and hairs beneath, Fl. in umbels
 13584 Leaves 3-lobed smooth above rough beneath
 13585 Leaves cordate angular above and the veins beneath covered with callous dots, Tendrils simple
 13586 Leaves cordate angular entire smooth with callous dots above and 5 glands at the base beneath
 13587 Leaves 3-lobed rough toothed, Lateral lobes angular somewhat 2-lobed, Fl. axillary somewhat umbellate
 13588 Lvs. 3-lobed toothed hispid on each side, Lat. lobes dilated angular: middle elong. Stem muricato-hispid
 13589 Leaves somewhat 3-lobed hairy narrowed at base
 13590 Leaves cordate palmate 5-lobed toothed with callous dots, Fl. racemose dioecious
 13591 Leaves cordate 5-lobed toothed rough with callous dots, Flowers racemose
 13592 Leaves cordate 5-lobed apiculate hairy, Peduncles in umbels
 13593 Leaves cordate 5-lobed entire with callous asperities on each side
 13594 Leaves 5-lobed toothletted scabrous above, Peduncles 1-flowered
 13595 Leaves 5-lobed somewhat toothletted, Lobes obtuse, Petioles and stem hispid
 13596 Leaves palmate smooth 5-parted: segments lanceolate repand serrated
 13597 Leaves 5-parted palmate, Segm. oblong lanc. acuminate serrated, Petioles muricated, Peduncles 1-flowered
 13598 Upper leaves 5-parted palmate, Segments oblong cut-toothed: lower cordate angular toothed
 13599 Lvs. 5-parted palmate, Segm. pinnatifid linear revolute at edge rough, Flowers in umbels, Berries acute

13600 Procumbent herbaceous

- 13601 Leaves sessile oblong blunt narrowed at base serrulate, Stem herbaceous
 13602 Leaves petiolate lanceolate narrowed at each end entire, Stem shrubby
 13603 Leaves stalked rhomboid acuminate entire, Stem arborescent

- 13604 Leaves obovate bluntish, Flowers twin axillary stalked, Stem branched round erect
 13605 Leaves lanceolate cuneate blunt mucronate, Flowers solitary stalked axillary, Stem shrubby branched
 13606 Leaves ovate-oblong blunt mucronate, Flowers axillary in threes, Branches compressed 3-cornered
 13607 Leaves elliptical ovate blunt narrowed at base, Fls. axillary aggregate dioecious, Branches square compr.
 13608 Leaves simple orbicular-ovate lucid, Flowers axillary: male turbinate nodding
 13609 Leaves oblong obtuse netted with red veins beneath, Flowers racemose and fasciculate
 13610 Leaves elliptical acute at each end, Stipules ovate acute as long as petiole, Flowers fasciated
 13611 Lvs. pinn. flower-bearing: leaflets oblong attenuated at base and narrower on one side, Fls. axill. aggreg.
 13612 Lvs. ovate acute, Fls. axill. somew. unbellid, Pedunc. filiform with 2 bractes at base, Branchlets compr.
 13613 Leaves lanceolate acute, Flowers terminal about 3, Branches pinniform 2-edged
 13614 Lvs. pinn. fl. bearing: leaf. elliptical obtuse, Pedunc. axill. lower usually twin and male: upp. solit. fem.
 13615 Lvs. pinn. fl. bearing: leaflets linear obtuse mucronate, Flowers axillary solitary; the female uppermost
 13616 Leaves pinnate fl. bearing: leaflets linear sharpish, Flowers axillary clustered, Petioles round downy

and Miscellaneous Particulars.

the only quadrupeds said to eat this plant. The root grows to a vast size. Gerard says, "the queene's chiefe chyrurgeon, Master William Godorow, shewed me a roote hereof, that waied halfe an hundred waight, and of the bignesse of a childe of a yeere old." To this Linnaeus ascribes the quickness of its growth, though it springs late. The roots have been formerly by impostors brought into an human shape, carried about the country, and shewn for mandrakes to the common people. The method which these people practised, was to open the earth round a young thriving Bryony plant, being careful not to disturb the lower fibres of the root; to fix a mould such as is used by those who make plaster figures close to the root, fastening it with wire to keep it in its proper situation, and then to fill in the earth about the root, leaving it to grow to the shape of the mould, which is effected in one summer. This root is a famous hydragogue, and highly purgative and acrid.

225. *Andrachne*. The Greek name of the Purslane. The modern plant bears some analogy to that of the Greeks, in its thick and fleshy leaf. Plants of little beauty, and the easiest culture.

206. *Stillingia*. Named after Dr. Benjamin Stillingfleet, an English botanist. *S. Schifera* is the tallow-tree of China. An oil is expressed from the kernel, which hardens by cold to the consistence of common tallow, and by boiling becomes as hard as bees' wax. *Stillingia sylvatica* is considered a specific in cases of syphilis.

207. *Phyllanthus*. From $\phi\upsilon\lambda\lambda\alpha\sigma$, leaf, and $\alpha\epsilon\iota\sigma\omega\varsigma$, a flower, because the flowers grow upon the edges of the

History, Use, Propagation, Culture,

leaves. Many of the species of this genus are remarkable for the neatness of their foliage and general aspect. The abolished genus *Xylophylla*, which is now included in *Phyllanthus*, is very generally cultivated on account of the pretty and at the same time singular appearance of its leafless leaf-like branches, covered over at the edges with multitudes of pink flowers. All the species require common stove culture.

2028. *Aleurites*. From *αλευρε*, flour, all the parts of the plant seeming to be dusted with a farinaceous substance. A handsome plant of easy culture, and ripe cuttings with their leaves untouched, root in sand under a hand-glass.

2029. *Omphalea*. A curtailment of *Omphalandra*, a name under which Dr. Patrick Browne, in his History of Jamaica, first described the plant. He formed it from *ομφαλος*, a navel, and *αυγ*, a stamen; because the male organs are collected in a fleshy navel-like mass occupying the centre of the flowers. It grows freely in light loamy soil, and cuttings, with their leaves unjured, root in sand under a hand-glass.

2030. *Hippomane*. From *ιππος*, a horse, and *μανια*, madness; the name was given by the Greeks to a plant which grew in Arcadia, and which possessed the dangerous property of making horses furious. This *Hippomane* must not, however, be confounded with that of Virgil (third *Georgic*), which is an animal substance.

The *Manchineel*-tree grows to a vast size on the sea coast of the Caribbean Islands and neighbouring continent. The leaves are ovate, serrated, acute, and very shining. The fruit fall off from the tree spontaneously, and pave all the ground with their numbers. They are highly poisonous, and are said to be eaten by the sea-crabs, which collect about the trees in vast numbers. But this is supposed by Jacquin to be a vulgar error. The whole tree abounds with a white milk, which is highly poisonous, and so very caustic, that a single drop placed upon the skin instantly causes the sensation of a hot iron, and in a short space raises a blister. It is a common belief that to sleep beneath the branches is death; but Jacquin and his companions reposed under it for three hours at a time without inconvenience. The wood is a most beautiful material for furniture, being finely variegated with brown and white, and susceptible of a high polish. The workmen who fell the trees, first kindle a fire around the stem, by which means the juice becomes so much inspissated as not to follow the blows of their axes. Whole woods on the sea-coast of Martinique have been burnt, in order to clear the country of such a dangerous pest.

- 13617 Leaves pinnate lanceolate acuminate subrenate coriaceous, Flowers stalked
- 13618 Leaves pinnate linear-lanceolate lined crenate, Flowers stalked hermaphrodite
- 13619 Leaves scattered linear-lanceolate subfalcate crenate, Flowers subsessile
- 13620 Leaves 3-lobed
- 13621 Leaves oblong blunt very smooth, Flowers triandrous, Stem arborescent
- 13622 Leaves ovato-serrated
- 13623 Leaves oblong acuminate serrulate, Petioles with 2 glands at the end
- 13624 Leaves lanceolate entire smooth variegated stalked
- 13625 Leaves linear entire stalked downy beneath
- 13626 Leaves elliptical entire bluntish hoary downy beneath stalked, Spikes terminal few-flowered
- 13627 Leaves ovate lanceolate plicated serrated scabrous
- 13628 Leaves ovate bluntish entire smooth, Fruit stalked
- 13629 Leaves ovate rhomboid repand entire at base hoary on each side, Pedunc. terminal about 3-fl.
- 13630 Leaves ovate serrated at end hoary downy beneath, Stipules ciliated, Spikes terminal subcapitate bracteate
- 13631 Leaves ovate acuminate serrated smooth with 2 glands at base, Petioles shorter than leaf, Racemes term.
- 13632 Leaves ovate acuminate entire smooth silvery with scales ben. Racemes comp. axillary, Stem arborescent
- 13633 Leaves cordate ovate attenuate somewhat toothletted warted and green above, silvery and shining beneath
- 13634 Leaves cordate acuminate serrulate rough above downy beneath with 4 glands at the base
- 13635 Lvs. round-lanceol. acum. ent. glandular-ciliated downy beneath, A fascicle of stalked glands at base of lvs.
- 13636 Leaves oblong subcordate serrulate scabrous downy beneath with 2 glands at the base, Raceme terminal
- 13637 Leaves ovate acute subcordate entire scabrous above downy beneath
- 13638 Leaves subcordate angular blunt repand scabrous downy beneath
- 13639 Leaves obl.-lance. subcordate scabrous downy beneath and with 2 glands at base, Branches densely downy
- 13640 Leaves 3-5-lobed serrated with hairy petioles, Stem herbaceous
- 13641 Leaves oblong-lanceolate obtuse at base variegated and stained with red, Spikes axillary suberect
- 13642 Downy, Leaves cordate roundish blunt repand greenish above hoary beneath

- 13643 Leaves palmate 7-lobed hispid beneath stinging: lobes pinnatifid, Petiole with 1 gland at end
- 13644 Lvs. cord. 5-lobed serrated fringed with glands, Branched glandular hairs in axillæ of leaves and petioles
- 13645 Leaves ovate acuminate entire very smooth, Racemes subcymose
- 13646 Leaves oblong subpanduriform acuminate entire angular at base with 2 teeth on each side
- 13647 Leaves cordate angular
- 13648 Leaves palmate 11-lobed smooth: lobes pinnatifid cuneate, Stipules setaceous multifid

and Miscellaneous Particulars.

2031. *Sapium*. A name under which Pliny indicates a sort of pine, so named from the abundance of resin which it produces; from *sap*, fat or greasy in Celtic. The Americans employ the juice of *Sapium aucuparium* as bird-lime, for catching parrots and other birds. For this purpose they cut off a limb of the tree, and the next day collect the sap which has flowed out and become inspissated. They call it *Mangle cautivo*. The juice is also burned in lamps. Cuttings root freely in sand under a hand-glass.

2032. *Croton*. The Greek name of a certain insect called *vicinus* by the Latins, which the fruit of *Croton* resembles.

Croton Tiglium affords an oil used in medicine, which is so powerfully irritating, that a small drop placed upon the tongue, has the effect of exciting an irritation along the whole intestinal canal, which does not soon subside. It is usually employed in mixture with oil of almonds, in order to weaken its too violent powers. C. linearis in its general appearance resembles rosemary, and is called wild rosemary in Jamaica. C. tinctorium is used to dye both silk and wool of an elegant blue color, and the juice is used to color wines and jellies. The substance for this purpose is called Turnsol, and is made of the juice which is lodged between the calyx and the seeds: this, if rubbed on cloths, appears at first of a lively green, but soon changes to a bluish purple; if these cloths are put into water, and afterwards wrung, they will dye the water of a clear color; the rags thus dyed are brought to England, and sold in the druggists' shops by the name of Turnsol.

C. *Eleutera* furnishes the *Cascarilla* bark, which is chiefly imported from Eleutheria, one of the Bahama Islands. It consists of pieces of about six or eight inches long, scarcely one-tenth of an inch thick, gulled, and covered with a thin whitish epidermis. It has a pleasant spicy odor, and a bitter warm aromatic taste. It is very inflammable, and is easily distinguished from all other barks by emitting, when burnt and extinguished, a fragrant smell resembling that of musk. Medically, this bark is a valuable carminative and tonic, and is an excellent adjunct to the Cinchona bark in fevers. C. *lacciferum*, a plant not yet in gardens, is one among several species on which the gum lac is said to be produced. Some of the spines we are in possession of, are much admired for their variegated leaves: all of them are freely propagated by cuttings with the leaves on, planted in sand, and plunged in moist heat under a hand-glass.

2033. *Jatropha*. From *ιατρον*, a remedy, and *φαζα*, to eat. The J. Manihot (*Mundooka*, Brazilian) or *Cassia*

History, Use, Propagation, Culture,

root, yields an excellent nutritious article of food when the juice has been expressed, which is a strong poison. *J. gossypifolia* is considered a beneficial plant in the West Indies, on account of the seeds, which are much relished by and very nourishing to poultry. *J. Manihot*, the Cassava of the West Indies, and the Mandioca and Tapioca of Brazil, formerly supplied the greater part of the nourishment of the natives of South America, and is now very generally cultivated there and in the West Indies. It yields an agreeable wholesome food; is of rapid growth, the roots arriving to perfection in about eight months, and it will thrive in any soil or situation. The juice of the root is sweetish, and when swallowed, or when the root is eaten without preparation, it brings on convulsions, and occasions violent retching and purging. It acts only on the nervous system; it produces no inflammation on the stomach; but the stomach of a man or other animal poisoned by it, appears to be contracted one half. A little mint-water and salt of wormwood, timely administered, will prevent all bad consequences. In preparing the roots for use as food, they are washed, scraped, and grated to a pulp; this pulp is then pressed, and when dried is a powder resembling sugar starch or flower fit for use. It is generally baked as bread, and bears a considerable resemblance to that made from wheat flour. The roots entire, or in a powdered state, form an article of considerable export from different parts of Brazil. All the species, thrive well in our stoves, and are increased by cuttings, which Sweet states, succeed best when stuck in the tan in a good heat.

2034. *Ricinus*. A name with the same derivation as Castor, No. 2032, which see. *R. communis*, though an annual and herbaceous plant in our gardens, becomes a tree in Africa of several years' standing. In Candia it continues many years, and, according to Belon, requires a ladder to come at the seeds. The seeds furnish the well known Castor-oil of medicine. This oil is obtained both by cotion and expression. The former method is performed by tying up the seeds, previously decorticated and bruised, in a bag, which is suspended in boiling water, till all the oil is extracted and rises to the surface, when it is skimmed off. Oil so obtained is apt to become rancid, and, therefore, the better mode is to subject the seeds to the press, in the same manner as is done with almonds to procure almond oil. (See *Amygdalus*.) The oil obtained is equal to one fourth of the weight of the seeds employed. It is often adulterated with olive oil, linseed oil, and poppy oil. The great value of castor oil as a purgative is the mildness and rapidity with which it operates. It is peculiarly adapted for infants,

- 13649 Leaves undivided 3-5-lobed palmate entire glaucous beneath
 13650 Leaves 5-lobed cordate toothed hispid stinging
 13651 Prickly, Leaves 3-lobed, Stem herbaceous

- 13652 Leaves peltate palmate: lobes lanceolate serrated, Stem herbaceous frosted, Capsules prickly
 13653 Lvs. pelt. palm.: lobes oblong toothed; middle obsolete 3-lobed, Stem herbaceous frosted, Caps. prickly
 13654 Leaves peltate palmate: lobes oblong serrated, Stem shrubby smooth, Stigmas 6, Caps. prickly
 13655 Leaves peltate palmate colored: lobes obl. serrate-toothed, Stem shrubby smooth colored, Caps. prickly
 13656 Leaves peltate palmate: lobes oblong serrated, Stem shrubby frosted, Capsules unarmed
 13657 Leaves peltate deeply palmate 9 cut serrated, Petioles glandular, Caps. with herbaceous spines
 13658 Leaves peltate ovate acuminate repand toothed, Caps. prickly

- 13659 Leaves ovate oblong slightly cordate toothed: lower teeth long entire at end
 13660 Leaves ovate deeply cordate equally serrate, Male catkin ovate

- 13661 Leaves ovate lanceolate, Capsules obovate
 13662 Hermaphrodite, Leaves ovate entire, Flowers panicle decandrous, Caps. smooth
 13663 5-lobed: lobes acuminate, Calyxes campanulate, Caps. ovate hispid
 13664 Leaves palmate 5-lobed, Calyxes rotate reflexed
 13665 Leaves digitate

- 13666 Leaves ovate simply veiny

- 13667 Female flowers at base of male spike, Invol. ovate acuminate toothed, Leaves obl. lanc. remotely toothed
 13668 Fem. fls. at base of male spike, Invol. cordate toothed, Leaves subrhomboid ovate serrated entire at base
 13669 Spikes axill. male upwards: female downw. Invol. cordate acuminate with imbricated serratures ciliated
 13670 Female flowers solitary or twin at base of the male spike, Invol. cordate serrate, Leaves rhomboid ovate
 13671 Female flowers at base of the male spike without an involucre, Leaves roundish ovate subcordate serrated
 13672 Spikes axill. male above female below, Invol. smoothish serrated, Leaves ovate acum. serr. cuneate at base
 13673 Female spike cylind. solitary terminal, Invol. 3-parted awned ciliated, Leaves roundish-ovate acuminate
 13674 Female flowers twin axillary, Involucres entire, Leaves ovate acuminate serrulate, Stem shrubby
 13675 Flowers dioecious: male spikel; female axillary, Invol. roundish entire, Leaves smooth lanc. subcord.
 13676 Spikes male above; fem. below, Invol. cuneiform toothed at edge, Styles multifid, lvs. obl. subcord. serr.
 13677 Spikes axillary male above; female below, Invol. cordate hispid, Leaves ovate acute hispid
 13678 Male spikes axillary female at base, Invol. O, Leaves ovate cordate acuminate serrated
 13679 Spikes axillary erect, Female involcs. cordate toothed very large, Leaves ovate-lanceolate serrated smooth
 13680 Flowers dioecious spiked, Spikes axill. Invol. of females cordate cut, Leaves obl. lanceolate serrated smooth

- 13681 Leaves 3-lobed serrated: lobes oblong serrated, Bractes 3-lobed ciliated, Petioles shorter than peduncle

and Miscellaneous Particulars.

women in childbed, and persons bed-ridden. Sown in pots on heat early in the season, and transplanted as soon as the frosts are over into a mass of light rich soil, the plant makes one of the most magnificent of border annuals, often attaining the height of ten or twelve feet.

2655. *Hura*. Its American name. *H. crepitans* is a rapid growing tree. From the quickness of its vegetation, its parts are of so loose a texture, that a loud clap of thunder, or a sudden gust of wind, frequently causes the largest boughs to snap asunder. The wood is only fit for joists and spars: the sap of the leaves and bark is corrosive, and the seeds when roasted purge both upwards and downwards. The species are propagated by large ripened cuttings, planted in sand, plunged in heat, and covered with a hand-glass. Its fruit when ripe bursts with a loud crack, whence the specific name of crepitans; they are of a very elegant form, resembling a depressed sphere with many rounded ribs, arranged with the utmost symmetry.

2636. *Sterculia*. Sterculius was the god of the privy, from *stercus*, excrement. It has been well observed by a French author, that the Romans, in the madness of paganism, finished by deifying the most immodest objects and the most disgusting actions. They had the gods Sterculius, Crepitus, Priapus; and the goddesses Caca, Pertunda, &c. &c. The flowers of one species and the leaves of the other are highly fetid. The species are lofty trees with large leaves, and some of them very showy flowers: they all thrive in light loamy soil; and ripened cuttings, with their leaves on, root in sand, plunged in moist heat, and covered with a hand-glass. The famous Cola nut of Guinea is the produce of *S. acuminata*.

2637. *Heritiera*. Named in honor of Charles Louis L'Heritier de Bruttelle, a distinguished French botanist, who was unfortunately assassinated in a street of Paris in 1800. He published many works, which will always have a high reputation for the excellence of their text, and the magnificence of their illustrations. A fine tree, which may be treated like *Sterculia*.

2658. *Acalypha*. A Greek name for the nettle, which this genus much resembles. It is compounded of α . privative, $\kappa\alpha\lambda\omicron\varsigma$, beautiful, and $\alpha\pi\tau\eta$, touch. Plants of no beauty and the easiest culture.

2638. *Dalechampia*. So called after James Dalechamp, a French botanist, born in 1513, died in 1588. He left a General History of Plants, and some commentaries upon Pliny. May be treated as *Plukenetia*.

2040. *Plukenetia*. *W.* *PLUKENETIA*. *Euphorbiaceæ*. *Sp.* 1—5.

History, Use, Propagation, Culture,

2040. *Plukenetia*. Named after Leonard Plukenet, an English botanist, who published some valuable works, with an immense number of copperplates, of singular merit for their time. The names of two of these works are so singular as to deserve explanation. One was called *Amaltheum botanicum*. This word in Greek, *Amaltheia*, was the name of the goat which suckled Jupiter. As its milk was exquisite and abundant, the word came to signify, among the ancients, the symbol of richness and abundance. The famous library of Atticus was called *Amaltheum*, on account of the number and variety of the books which it contained. In

CLASS XXII. — DIOECIA.

Male and female flowers upon different plants.

To this class many of the observations made upon the last are equally applicable. Like it, the genera would have been more conveniently distributed among previous classes. The genera it contains are chiefly trees, and many of them form the most valuable portion of the forests of all parts of the world.

In Monandria is found the celebrated Pandanus or screw pine, which, with its strange spiral branches, constitutes one of the most singular features of the vegetation of the Isle of France. Diandria contains the valuable *Salix*; Pentandria, the hop, the hemp, and the spinage. The black Bryony, and various palms have a station in Hexandria; the poplar in Octandria; the Papaw and the Bonduc tree in Decandria. Monadelphia is richly endowed with valuable trees, such as the yew, the Norfolk Island pine, the juniper, the nutmeg; and it also contains the wonderful pitcher-plant of China.

Order 1. MONANDRIA.  Stamen 1.

2041. *Pandanus*. Male. Cal. O. Cor. O. Anthers cuspidate. Female. Cal. O. Cor. O. Style bifid. Drupe compound or simple.

Order 2. DIANDRIA.   Stamens 2.

2042. *Salix*. Barren fl. Scales of the catkin single-flowered, imbricated, with a nectariferous gland at its base. Perianth, O. Stam. 1-5. Fertile fl. Scales of the catkin single-flowered. Perianth, O. Stigmas 2, often cleft. Caps. 1-celled, 2-valved, many-seeded. Seeds comose.

2043. *Cecropia*. Male. Spatha falling off. Catkin cylindrical. Cal. turbinate 4-cornered scales. Cor. O. Female, as in the male. Style 1. Stigma torn. Ovaries imbricated. Berry 1-seeded.

2044. *Borya*. Male. Cal. 4-leaved. Cor. O. Stamens 2-3. Female. Stigma capitate. Berry 1-seeded.

Order 3. TRIANDRIA.   Stamens 3.

2045. *Empetrum*. Barren fl. Cal. tripartite. Cor. of 3 petals (7 in E. B.). Stam. 3 (9 in E. B.), upon long filaments. Fertile fl. Cal. tripartite. Cor. of 3 petals. Style very short. Stigma with 6-9 rays. Berry superior, globose, with 6-9 seeds.

2046. *Willowenia*. Male. Cal. of many glumes. Petals 6. Nectary fleshy, 6-parted, surrounding the corolla. Female. Ovary superior. Style 1. Stigmas 2-3. Drupe 1-seeded.

2047. *Restio*. Spike imbricated. Cal. 6 equal glumes. Cor. O. Female. Styles 2-3. Nut stony, 1-celled, 1-seeded.

2048. *Elegia*. Cal. 6 unequal glumes. Female. Styles 3. Caps. 6-celled. Seeds solitary

13682 Angles of capsules compressed keeled

and *Miscellaneous Particulars.*

this sense Plukenet applied it to a work in which a great variety of curious plants was assembled. The other work was called *Almagestum*. This also came originally from the Greek. Claudius Ptolemaeus, an astronomer and mathematician, published about the middle of the second century a work on astronomy, called *Συγγραμματα μαθηματικά*, which may be Englished "Great work." Ishac ben Honain translated it into Arabic at the beginning of the ninth century, by order of the Caliph Mahmoud; to its title he added the Arabic article *Al*, and so formed the word *Al-magesti* or *Almagesti*.

2049. *Pheniz*. Cal. 3-parted. Petals 3. Ovary 1. Drupe ovate-oblong.
 2050. *Sitago*. Male. Cal. tubular, 3-4-toothed. Cor. O. Stamens 2-3. Female, an annular disk at the base of the ovary. Stigmas 2, one bifid. Drupe 1-seeded.
 2051. *Osyris*. Male. Cal. 3-fid. Cor. O. Female. Style 1. Stigma roundish. Berry 1-celled.

Order 4. TETRANDRIA.  Stamens 4.

2052. *Aulax*. Male. Flowers racemose. Cal. O. Petals 4, stamiferous. Female. Stigma oblique. Nut exserted, ventricose, bearded.
 2053. *Leucadendron*. Male. Flowers capitate. Cal. O. Petals 4, stamiferous. Female. Stigma oblique. Nut or samara 1-seeded, included in the scales of the cone.
 2054. *Viscum*. Barren fl. Cal. O. Petals 4, dilated at the base, connate, resembling a cal. Anthers sessile, adnate with the petals. Fertile fl. Cal. submarginate. Petals 4, dilated at the base. Style 1. Drupe inferior, 1-seeded.
 2055. *Myrica*. Barren fl. Scales of the catkin concave. Perianth, O. Fertile fl. Scales of the catkin concave. Perianth, O. Styles 2. Drupe 1-celled, 1-seeded.
 2056. *Nageia*. Cal. 4-leaved. Cor. O. Petals bifid. Drupe 1-seeded.
 2057. *Shepherdia*. Male flowers in a catkin, 8-androus. Female racemose at the ends of the branches. Limb of calyx flat, regular, 4-parted. Disk with 8 glands. Fruit of *Hippophae*.
 2058. *Hippophae*. Male flowers in a catkin, tetrandrous. Female solitary in the axilla of the leaves. Calyx tubular, bifid at end, closed. Disk O. Fruit formed of a berried calyx and akenium.
 2059. *Broussonetia*. Male. A cylindrical catkin. Cal. 4-parted. Female. A globose catkin. Cal. tubular, 3-4-toothed. Ovaries becoming fleshy, clavate, prominent. Style lateral. Seed 1, covered by the calyx.
 2060. *Schefferia*. Cal. 4-leaved. Petals 4 or O. Berry 2-celled. Seeds solitary.
 2061. *Brucea*. Male. Cal. 4-parted. Petals 4. Disk 4-lobed. Female. Pericarpis 4, 1-seeded.
 2062. *Anthospermum*. Male. Cal. 4-toothed. Cor. with a short tube, and 4-parted limb. Female. Ovary inferior. Styles 2, reflexed. Fruit bipartible.
 2063. *Trophis*. Male. Cal. O. Petals 4. Female. Cal. O. Cor. O. Style 2-parted. Berry 1 seeded.
 2064. *Montinia*. Male. Cal. 4-toothed. Petals 4. Female. Style bifid. Stigmas reniform. Capsule inferior, 2-celled, many-seeded.

Order 5. PENTANDRIA.  Stamens 5.

2065. *Pistacia*. Male. Cal. 5-fid. Cor. O. Female. Cal. 3-fid. Cor. O. Styles 5. Drupe 1-seeded.
 2066. *Xanthorylum*. Male. Cal. 5-parted. Cor. O. Stamens 3-5. Female. Ovaries 5. Caps. 3-5, one-seeded.
 2067. *Picramnia*. Male. Cal. 3-5-parted. Petals 3-5. Stamens 3-5. Female. Styles 2. Berry 2-celled, 2-seeded.
 2068. *Antidesma*. Male. Cal. 5-leaved. Cor. O. Anthers bifid. Female. Stigmas 5. Berry cylindrical, 1-seeded.
 2069. *Iresine*. Male. Cal. 2-leaved. Petals 5. Scales 5-7. Female. Stigmas 2, sessile. Caps. with downy seeds.
 2070. *Spinacia*. Male. Cal. 5-parted. Cor. O. Female. Styles 4. Seed 1, within the indurated calyx.
 2071. *Fluggea*. Male. Cal. 5-leaved. Cor. O. Rudiment of an ovary. Female. Style 2-parted. Stigmas recurved, bifid. Berry 4-seeded. Seeds with an arillus.
 2072. *Acnida*. Male. Cal. 5-parted. Cor. O. Female. Cal. 3-parted. Styles O. Stigmas 3, sessile. Caps 1-seeded.

2074. *Cannabis*. Male. Cal. 5-parted. Female. Cal. 5-leaved, entire, opening at the side. Styles 2. Nut 2-valved within the closed calyx.
 2074. *Humulus*. Barren fl. Perianth. single, of 5 leaves. Anthers with 2 pores at the extremity. Fertile fl. Scales of the catkin large, persistent, concave, entire, single-flowered. Perianth. O. Styles 2. Seed 1.
 2075. *Modecca*. Cal. 5-fid. Petals 5, inserted in the calyx. Scales 5-10, rarely O. Male. Stamens 5. Anthers erect. Female. Caps. stalked, 1-celled, 3-valved, many-seeded.

Order 6. HEXANDRIA.  Stamens 6.

2076. *Xerotes*. Cor. 6-parted, somewhat colored. Male. Stamens 6. Anthers peltate. Female. Stamens abortive. Ovary 3-celled, with 1-seeded cells. Caps. cartilaginous, 3-celled, 3-valved. Seeds peltate.
 2077. *Etaiis*. Cal. 6-leaved. Cor. 6-fid. Style 1. Stigma 3. Drupe 1-seeded, fibrous. Nut 3-valved.
 2078. *Chamedorca*. Cal. 3-parted. Cor. 3-parted. Stamens 6. Rudiment of a style. Female. Scales 3. Styles 3. Drupe succulent, 1-seeded.
 2079. *Borassus*. Cal. 3-leaved. Cor. hypocrateriform, with a 3-parted limb. Female. Cal. 8-9-leaved, imbricated. Cor. O. Style O. Drupe with 3 stones.
 2080. *Mauritia*. Cal. cyathiform, somewhat 3-toothed. Petals 3. Drupe 1-seeded, tessellated.
 2081. *Smilax*. Cal. 5-leaved. Cor. O. Styles 3. Berry 3-celled. Seeds 2.
 2082. *Tamus*. Cal. 6-parted. Cor. O. Styles 3-fid. Berry 3-celled, inferior. Seeds 2.
 2083. *Testudinaria*. Perianth. 6-parted, spreading; segments linear, nearly equal. Male. Stamens 6, inserted in the base of the segments. Female. Styles 3, united. Capsule membranous. Seeds winged.
 2084. *Rajania*. Cal. 6-parted. Cor. O. Styles 5. Samara 1-seeded.
 2085. *Dioscorea*. Cal. 6-parted. Cor. O. Styles 3. Capsule 3-celled, compressed. Seeds 2, membranous. Leaves generally alternate.
 2086. *Maba*. Cal. 3-fid. Cor. tubular, trifid. Drupe 2-celled. Cells 2-seeded.

Order 7. OCTANDRIA.  Stamens 8.

2087. *Populus*. Barren fl. Scales of the catkin lacerated. Anthers 8-30, arising from a turbinate, oblique, entire, single perianth. Fertile fl. Scales of the catkin lacerated. Perianth. turbinate, entire. Stigmas 4. Caps. superior, 2-celled, 2-valved, many-seeded. Seeds comose.

Order 8. ENNEANDRIA.  Stamens 9.

2088. *Mercurialis*. Barren fl. Perianth. single, tripartite. Stam. 9-12. Anthers globose, 2-lobed. Fertile fl. Perianth. single, tripartite. Styles 2. Caps. 2-celled. Cells 1-seeded.
 2089. *Hydrocharis*. Barren fl. Cal. tripartite. Petals 3, "the three interior filaments beaked." Sm. Fertile fl. Cal. tripartite. Petals 3. Styles 6, each with 2 stigmas. Caps. inferior, coriaceous, roundish, six-celled, many-seeded.
 2090. *Triplaris*. Cal. 3-parted. Petals 3. Stamens 9. Styles 3. Capsule 1-seeded, 3-valved.

Order 9. DECANDRIA.  Stamens 10.

2091. *Coriaria*. Cal. 5-parted. Cor. O. Scales 5. Anthers 2-parted. Styles 5. Caps. 5, 1-seeded, covered by the enlarged scales.
 2092. *Kiggetaria*. Cal. 5-parted. Petals 5; glands 5, 3-lobed. Anthers perforated. Styles 5. Capsule one-celled, 5-valved, many-seeded.
 2093. *Schinus*. Cal. 5-fid. Petals 5. Berry 3-coecous.
 2094. *Gymnocladus*. Cal. 5-toothed. Petals 5. Style 1. Legumen 1-celled, pulpy inside.
 2095. *Cerice*. Male. Cal. hardly any. Cor. 5-fid, funnel-shaped. Filam. in the tube of the cor. Female. Cal. 5-toothed. Petals 5. Stigmas 5. Berry furrowed, 1-celled, many-seeded.

Order 10. DODECANDRIA.  Stamens 12.

2096. *Stratiotes*. Male. Spatha 2-leaved. Cal. 3-parted. Petals 3. Stamens 11-13, perfect, 20 abortive. Ovary inferior, 6-angular. Styles 6, 2-parted. Berry 6-celled, many-seeded.
 2097. *Hyenanche*. Cal. 5-7-leaved. Cor. O. Stamens 10-20. Style 1. Stigmas 3. Caps. 3-celled, 3-coecous. Cells 2-seeded.
 2098. *Euclea*. Cal. 5-toothed. Cor. 5-parted. Stamens 15. Ovary superior. Styles 2. Caps. berried, 3-horned, 3-celled. Seeds solitary, with an arillus.
 2099. *Datisca*. Male. Cal. 5-leaved. Cor. O. Anthers sessile. Female. Cal. 2-toothed. Styles 3. Capsule 3-angular, 3-horned, 1-celled, perivious, inferior.
 2100. *Menispermum*. Male. Cal. 2-leaved. Petals 4 or 6 on the outside, 8 inside. Stamens 16. Female. Stamens 8, sterile. Ovaries 2-3. Berries 2, 1-seeded.
 2101. *Cocculus*. Sepals and petals ternate, usually in two, rarely in three rows. Male. Stamens 6, distinct, opposite the petals. Female. Drupe berried, 1-6, generally oblique, reniform, somewhat compressed, 1-seeded. Cotyledons distinct.

Order 11. ICOSANDRIA.  Stamens numerous, inserted in the calyx.

2102. *Flacourtia*. Cal. 5-parted. Cor. O. Stamens 50-100. Stigma stellate, sessile. Berry many-celled, with 2-seeded cells.
 2103. *Peumus*. Male. Cal. campanulate, 5-fid. Petals 5, inserted in the calyx, reflexed. Stamens about 46, glandular. Female. Scales 5, subsagittate. Ovaries 2-9. Style O. Drupe oval, acuminate.
 2104. *Gelonium*. Cal. 5-leaved. Cor. O. Stamens 12. Stigmas 3, lacerated. Caps. 3-celled, 3-valved, 3-seeded.
 2105. *Rottlera*. Male. Cal. 2-parted. Cor. O. Stamens 30-40. Female. Cal. 4-toothed. Styles 3. Caps. 3-celled, tricocous, 3-seeded.

Order 12. POLYANDRIA.

Stamens numerous, inserted under the ovarium.

2106. *Cliffortia*. Cal. 3-leaved. Cor. O. Stamens about 30. Styles 3. Caps. 3-celled. Seed 1.
 2107. *Cycas*. Male. Catkin imbricated. Cal. a spatulate scale. Cor. O. Anthers globose, sessile, on a scale. Female. Spadix compressed, 2-sided. Cal. O. Cor. O. Style 1. Drupe 1-seeded.
 2108. *Zamia*. Catkin like a cone. Male. Calyx an obovate scale. Cor. O. Anthers globose, opening by a slit, sessile on the scale. Female. Cal. peltate scales. Ovaries 2. Style O. Berries 2, 1-seeded.

Order 13. MONADELPHIA.

Stamens united into one body.

2109. *Latania*. Spadix many-leaved. Calyx 3-leaved. Petals 3. Stamens 15-16. Drupe coated, with three stones.
 2110. *Leptocarpus*. Cal. 6-leaved, glumaceous. Cor. O. Stamens 3. Ovary superior. Style 1. Stigmas 2 or 3. Utricle or nut crustaceous, crowned by the base of the style.
 2111. *Ruscus*. Cal. 6-leaved. Cor. O. Male. Rudiment of ovary ovate, perforated at end. Female. Style 1. Berry 3-celled. Seeds 2.
 2112. *Araucaria*. Male. Catkin imbricated. Cal. a woody scale. Anthers 10-12, united in a scale. Female. Catkin cone-shaped. Cal. a lanceolate 2-flowered scale. Style O. Stigma 2-valved. Nut coriaceous, cuneiform, winged at end.
 2113. *Juniperus*. Barren fl. Scales of the catkin subpeltate. Perianth. O. Stam. 4-8, 1-celled. Fertile fl. Scales of the catkin few, united at length, fleshy, and surrounding the 3-seeded berry.
 2114. *Taxus*. Barren fl. Perianth. single at the base. Stam. numerous. Anthers peltate, 6-8-celled. Cells opening beneath. Fertile fl. Perianth. single, urceolate, scaly. Style O. Drupe fleshy, perforated at the extremity.
 2115. *Ephedra*. Male. A catkin. Cal. 2-fid. Stamens 7. Anthers 4 inferior, 2 superior. Female. Cal. 2-parted, quintuple. Ovaries 2. Seeds 2, covered by the berried calyx.
 2116. *Cissampelos*. Male. Cal. 4-leaved. Cor. O. Disk rotate. Stamens 5. Filaments connate. Female. Cal. 1-leaved, ligulate, rounded. Styles 3. Berry 1-seeded.
 2117. *Excoecaria*. Male. Catkin cylindrical. Cal. a scale. Filament 3-parted. Female. Calyx 3 scales. Caps. 3-coccous.
 2118. *Adelia*. Male. Cal. 3-parted. Cor. O. Stamens OO. Female. Cal. 5-parted. Styles 3, torn. Capsule 3-coccous.
 2119. *Loureira*. Male. Cal. 5-parted. Cor. tubular, campanulate, 5-fid. Stamens 8-13, cohering at base. Female. Stigmas 3-4. Capsule dioecous, 2-celled, with 1-seeded cells.
 2120. *Myristica*. Male. Cal. O. Cor. campanulate, trifiid. Filament columnar. Anthers 6-10, connate. Female. Style 1. Stigmas 2. Drupe with an arilled 1-seeded nut. Seed large, veiny, variegated in the inside.
 2121. *Nepenthes*. Cal. 4-parted, spreading, colored inside. Cor. O. Filament columnar. Anthers 15-17, connate. Stigma peltate, sessile. Caps. 4-celled, many-seeded.
 2122. *Cluytia*. Male. Cal. 5-leaved. Petals 5. Disk glandular. Stamens 5, inserted into the rudiment of an ovarium. Female. Styles 3. Capsule 3-celled. Seed 1.

History, Use, Propagation, Culture,

2041. *Pandanus*. The Malay name of the genus is *Pandang*, which is said to signify, being interpreted, something to be regarded, and to have been so named on account of the beauty of the tree, and its exquisite odor. *P. odoratissimus* is a large spreading branching bush, with stem-clasping imbricated leaves, bearing some resemblance to those of the pine-apple; from three to five feet long, and placed in three spiral rows round the extremities of the branches. It grows in all soils and situations in the warmer parts of Asia, and is much employed there for hedges. It grows readily from branches, whence it is rare to find the full-grown ripe fruit. The tender white leaves of the flowers, chiefly those of the male, yield that most delightful fragrance, for which they are so generally esteemed, and for which the plant is cultivated in Japan. Of all the perfumes, it is by far the richest and most powerful. The lower pulpy part of the drupe is sometimes eaten by the natives in times of scarcity and famine. The tender white base of the leaves is also eaten raw or boiled, at such melancholy times. The taste of the pulpy part of the drupe is very disagreeable. The roots are composed of tough fibres, which basket-makers use to tie their work with; they are so soft and spongy as to serve the natives for corks. The leaves are composed of longitudinal, tough, useful fibres. In the South Sea Islands, where the *Pandanus* is also a native, this or some other species or variety is used for making mats. The leaves are beautifully white and glossy. In the Sandwich islands these mats are handsomely worked in

MONANDRIA.

- 13683 Leaves at back and edges spiny-toothed, Fruit globose solitary
 13684 Leaves at back and edges spiny-toothed, Fruit globose, Branches ternate dichotomous
 13685 Stem without stolones, Clust. of drupes with from 9 to 20 cells obtuse depressed and tessellate at end
 13686 Leaves at back and edges spiny-toothed, Fruit globose aggregated
 13687 Leaves quite entire
 13688 Leaves at edge and back serrate-spiny, Branches of stem erect
 13689 Leaves and edges spiny-toothed, Spines distant, Drupe oblong solitary, Fruits fascicled

DIANDRIA.

§ 1. *Leaves smooth-serrated.*

- 13690 Leaves lin. obl. serr. smooth rather unequally sloping at base, Catkins accompanying the leaves triandrous, Ovary stalked ovate compressed smooth, Stigma nearly sessile
 13691 Leaves lanceolate tapering toward each end serrat. smooth Footst. decurr. Catk. accompanying the leaves triandrous, Ovary stalked oblong constricted smooth
 13692 Leaves lanceolate tapering at each end serrated glaucous beneath, Catkins accompanying the leaves triandrous polygamous, Ovary stalked oblong lanceolate smooth, Stigmas sessile
 13693 Leaves lanceolate pointed obtuse at the base smooth wavy and serrated, Footstalks decurrent, Catkins accompanying the leaves triandrous, Ovary stalked elliptic oblong, Style elongated
 13694 Leaves elliptical roundish at the base serrated pointed glaucous white beneath, Catkins accompanying the leaves triandrous, Ovary stalked ovate smooth, Stigmas sessile
 13695 Leaves ovate unequal at the base serrated smooth, Catkins accompanying the leaves triandrous, Ovary stalked ovate compressed smooth, Stigmas nearly sessile, Young branches furrowed
 13696 Lvs. lanc. serrate quite smooth, Petioles somew. glandular, Ovary narrowed stalked, Branches varnished
 13697 Leaves lanceolate acuminate serrated smooth, Ovaries pedicellate subulate smooth
 13698 Lvs. lin. pointed finely serrat. smooth, Stam. about 6, Ovary stalked round-ovate smooth, Stigmas sessile
 13699 Leaves elliptic-lanceolate pointed finely serrated smooth glaucous beneath, Catkins following the leaves, Stamens about 6 deflexed, Ovary stalked ovate smooth, Style elongated
 13700 Leaves ovato-lanc. pointed serrated green on both sides smooth with a downy rib and footst. Catkins accompanying the leaves vill. Stam. about 5 bearded at base, Ovary stalked ov. lanc. smooth, Stigm. divid.
 13701 Leaves elliptic-lanceolate or ovate pointed crenate glandular smooth, Footstalks glandular at the top, Catkins following the leaves, Stam. 5 or more hairy, Ovary ovate smooth nearly sessile
 13702 Leaves ellipt. lanc. acute green, smooth glaucous beneath, Catkins before leaves, Ovary stalked lanc. downy
 13703 Leaves elliptical lanceolate with wavy serratures smooth glaucous beneath, Stipules somewhat lunate glandular on the inside, Ovary stalked silky, Style longer than the stigma
 13704 Leaves obovate bluntish serrated smooth glaucous beneath, Catkins dense with fringed scales, Ovary stalked awl-shaped nearly smooth, Style longer than the stigmas
 13705 Leaves elliptical acute at each end smooth serrat. green on both sides: midrib footstalks as well as young foliage downy, Catkins before the leaves, Ovary ovato-lanceolate long stalked smooth
 13706 Leaves elliptical acute serrated smooth obtuse at base glaucous beneath: midrib footstalk as well as young foliage hairy, Ovary oblong downy
 13707 Leaves elliptical acute tooth-serrated smoothish glaucous beneath, Ovary lanceolate silky
 13708 Lvs. ellipt. acute serrat. smoothish glaucous ben. Stip. small or none, Catk. hairy, Caps. sess. very smooth
 13709 Leaves oblong elliptical acute serrated smooth glaucous beneath, Footstalks elongated downy, Stipules ovate toothed permanent, Catkins before the leaves, Ovary lanceolate smooth
 13710 Lvs. ovate acute serrated undulate cracking smooth heart-shaped at the base glaucous beneath, Stipules unequally heart-shaped longer than the broad footstalks, Catkins very woolly, Ovary lanc. smooth
 13711 Lvs. ovate acute serrated smooth glaucous beneath, Footstalks very short smooth, Stipules ovate serrated permanent, Catkins accompanying the leaves, Ovary lanceolate nearly sessile

and Miscellaneous Particulars.

a variety of patterns, and stained of different colors. The branches being of a soft spongy juicy nature, cattle will eat them very well when cut into small pieces. They call it Wharra tree at Otabeite. (*Hawksu. Voy. ii. 217.*)

2042 *Salix*. From the Celtic *sal*, near, and *lis*, water. Our common name osier, seems to be a slight alteration of the Greek *osera*, which means the same thing. This is a numerous and difficult genus of trees and shrubs, with one or two exceptions limited in their range to the temperate regions of Europe and America. Many of the species are distinguished by such delicate shades, that only the most acute botanists can recognize them. Soil, situation, and climate produce so considerable a change in their appearance, as to render it difficult to determine what are species and what varieties. Those species which attain a timber size, are chiefly valued for the rapidity of their growth; they produce a great bulk of trunk and lop in a short time, and the bark of most of the species has recently been used in tanning; being, at an average of sorts, about half as valuable as that of the oak. *S. alba* is considered the most valuable timber tree of the genus; it has a branching stem, and tapering flame-shaped head. It may be seen pollarded by way-sides in most parts of Europe, in which state it is very productive of poles, fence wood, crate ware, fuel, and bark for the tanner, which is considered nearly as good as that of the oak. A variety of this species, called by Pontey, the red

History, Use, Propagation, Culture,

twigged upland willow, and the *S. russelliana*, are considered the two next best species of the tree kind, and indeed, greatly resemble each other.

The best willows for hoops and basket work are *S. viminalis*, *stipularis*, *rubra*, *Forbyana*, *triandra*, *mollissima*, and *vitellina*. *S. triandra* is the most common, and is grown both for basket work and hoops. *S. Forbyana* is the best for the finer sorts of basket work. *S. stipularis* is the species commonly cultivated in Holland for hoops and rods. *S. purpurea* is one of the toughest of willows, and the extreme bitterness of the leaves and twigs renders it valuable for the tanner, for withs and basket work, not being liable to be eaten by vermin, and for hedges which cattle will not brouse on. In bands for thatching, *Linnaeus* says, it lasts above

- 13712 Lvs oval-obl. acute with distant wavy serratures smooth glauc. ben. Stipules $\frac{1}{2}$ heart-shaped deeply toothed, Catkins villous before the leaves, Ovary stalked ovate pointed silky, Style elongated, Stigma cloven
- 13713 Leaves ovato-lanceolate smooth bluntly serrated glaucous beneath, Catkins before the leaves, Scales short rounded hairy, Ovary awl-shaped silky on a stalk thrice the length of the scale
- 13714 Lvs. lanc. acute very long gradually tapering at base finely serrated quite smooth scarcely paler beneath, Stip. $\frac{1}{2}$ heart-shap. Catkins before lvs. erect smooth, Ovary stalk. ov. smooth, Style divid. Stigm. 2-lobed
- 13715 Leaves lanceolate serrated smooth glaucous beneath somewhat unequal at base, Stipules lunate toothed, Catkins lax, Ovary stalked ovate silky, Stigmas sessile divided
- 13716 Lvs. ovato-lanc. bluntly serr. smooth ac. glauc. ben. gland. at base, Stip. ov. with gland. serrat. Catk. wool. Ovary lanceolate smooth its stalk longer than the scale, Style the length of the divided stigmas
- 13717 Lvs. ovato-lanc. serrat. smooth paler ben. heart-shaped at the base, Stip. rounded finely toothed, Catk. accomp. lvs. mostly triand. Sea. lanc. woolly, Ovary stalked lanc. smooth, Style length of divided stigm.
- 13718 Lvs. ellipt. lanc. rigid smooth sharply serrat. two lowest serratures elongated, Footst. hairy, Stip. dilated round. with glandul. serrat. Catk. accomp. lvs. mostly triand. Sc. woolly, Ovary lanc. smth on long stalk
- 13719 Lvs. ov taper-point. smooth shining with glandul. serrat. mostly crowded at stip. tooth. Catk. accomp. lvs. mostly triand. Scales hairy at base obt. serr. and smooth at end, Ovary stalked lanc. awl-shaped smooth, Style divided, Stigma obtuse
- 13720 Leaves lanceolate jointed smooth green on both sides with gland. serr. Catkins accomp. lvs. Neet. double rather large: its lobes lanceolate smooth toothed at the summit; the terminal flowers triandrous
- 13721 Lvs. lanc. acum. uneq. and bluntly serrated smooth somew. glauc. ben. Branches dark purple with a bloom
- 13722 Leaves lanc. acute with cartilaginous serrat. smooth above glaucous and somew. silky ben. Stip. small and deciduous smooth on their inside. Ovary sessile ovato-lanceolate smooth, Stigmas nearly sessile 2-lobed
- 13723 Leaves ovato-lanc. pointed serrated throughout very smooth, Footstalks glandular, Ovary ovate nearly sessile, Male flowers with an abortive ovary
- 13724 Leaves broadly lanc. pointed smooth with glandular serrat. glaucous beneath, Footstalks slightly hairy without glands, Catkins before the leaves, Ovary sessile ovate smooth, Style elongated
- 13725 Triandrous, Stamens reflexed, Leaves about four inches long and one broad smooth and green beneath
- 13726 Leaves lanceolate taper-pointed sharply serrated smooth glaucous beneath, Stipules $\frac{1}{2}$ ovate taper-pointed revolute, Catkins naked accompanying the leaves, Ovary ovate sessile smooth, Branches pendulous
- 13727 Decumb. Stam. 1, Leaves obovato-lanc. serrated smooth narrow at base, Stigm. very short ov. nearly sess.
- 13728 Lvs. downy serrulate acum. glaucous beneath, when old becoming smoother, Catkins before lvs. Style long
- 13729 Erect, Stamen 1, Leaves mostly opposite oblong lanc. pointed slightly serrated smooth linear at base, Style nearly as long as divided stigmas
- 13730 Erect, Stam. 1, Lvs obov. lanc. ac. serrat. smth. round. at base, Stip. none, Stig. very short ov. notched obt.
- 13731 Branches downy, Leaves elliptical acute glaucous beneath: the young ones downy
- 13732 Stam. combined below. Leaves linear lanc. elongated acute smooth with shallow serratur. green on both sides
- 13733 Erect, Stamen 1, Leaves alternate with small stipules lanceolate acute with shallow serratures smooth rounded at base glaucous beneath, Style nearly as long as the linear divided stigmas
- 13734 Stamens combined below, Leaves elliptical slightly serrated quite smooth glaucous beneath
- 13735 Leaves elliptic-oblong toothed waved thin and crackling very smooth, Stipules heart-shaped about the length of the footstalk, Catkins very woolly, Ovary lanceolate smooth on a short stalk
- 13736 Leaves linear lanceolate acute very finely serrated smooth shining and green on both sides, Stipules none, Catkins accompanying leaves cylindrical villous, Scales ovate acute, Stam. 3 to 5 bearded half way up
- 13737 Leaves very long linear-lanc. closely serrated tapering gradually and somewhat falcate upwards acute at the base smooth on both sides: the young ones silky, Stipules crescent-shaped toothed deflexed
- 13738 Leaves elliptical nearly orbicular smooth somewhat serrated in the middle rather glauc. beneath, Catk. after the leaves, Capsules ovato-lanceolate stalked downy
- 13739 Leaves ovate serrated naked smooth and even above glaucous beneath, Branches rather downy, Capsules ovate silky, Style as long as the stigmas
- 13740 Leaves elliptical serrated smooth veiny polished on both sides, Young branches hairy, Ovary awl-shaped clothed with silky hairs, Style as long as the cloven stigmas
- 13741 Leaves obovate-elliptical smooth rather acute serrated in the middle shining above somewhat glaucous beneath, Ovary lanceolate silky, Young branches smooth
- 13742 Lvs. ov. serrat. nak. reticul. with promin. veins above rather glauc. ben. Ovary ellipt. silky, Style very short
- 13743 Somew. erect straggling, Branches polished, Lvs. obl. lanc. acute at each end serrul. in mudd. very smooth
- 13744 Leaves obovate lanceolate acute smooth subserrated glaucous beneath, Stipules small, Ovaries ovate silky
- 13745 Leaves ovate serrated smooth even above glaucous and silky beneath, Ovary ovate silky, Style as long as the stigmas, Stems decumbent
- 13746 Leaves ovate finely toothed smooth minutely veined folded so as to form a keel, Ovary ovate downy
- 13747 Lvs. ov. ellipt. ac. serrat. smooth tapering at base glauc. ben.: lower serrat. glandular, Caps. ov. lanc. smth.
- 13748 Leaves oblong acute serrulate whole colored beneath, when old quite smooth

and Miscellaneous Particulars.

a century in Scania. Few of the willow species can be considered ornamental, though the male plants of *S. pentandra* and *amygdalina* produce numerous showy catkins of a bright yellow color, and very odoriferous. The leaves of *S. pentandra* are also fragrant, exuding a copious yellow resin from their serrated edges. The down of the seeds of this and other species, mixed with the third part of cotton, has been found a useful adulteration, especially for stuffing cushions and forming candle-wicks. Goldfinches and other birds line their nests with this material.

The weeping-willow is generally admired; it grows wild on the coast of Persia, and is common in China. It is sometimes said to have been introduced by Pope, but the celebrated specimen of that tree which stood in

History, Use, Propagation, Culture,

the poet's garden at Twickenham, was a cutting from some rods employed in a package which came from Spain. Pope being present when the package was opened, observed that the pieces of stick appeared as if they had some vegetation, and added, perhaps they may produce something which we have not in England. Under this idea he planted it in his garden, and it produced the willow tree that has given birth to so many others; not as the parent tree of all the willows in the country, but as an admired and celebrated specimen. *S. herbacea* is not properly an herbaceous plant, but possesses the Linnæan character of a tree, and is the smallest yet

13749 Lvs. lanc. acut. serrul. smooth glauc. ben. Catkins appearing with lvs. Caps. ov. lanc. smooth, Styles twin
 13750 Lvs. obl. lanc. acute crenul.-serr. glaucous beneath, Stipules obsolete, Scales short round with long hairs
 13751 Lvs. orbicul. somew. retuse serrated shining on each side, Fem. catkins about 5-fl. Caps. ov. lanc. smooth
 13752 Lvs. obl. and ovate-lanc. acute toothletted glaucous beneath, Stipules large toothed, Catkins short, Styles long
 13753 Leaves lanc. acute obscurely serrated smooth and shining on both sides reticulated with veins beneath,
 Ovary lanceolate hairy, Style elongated, Stigmas deeply divided

§ 2. *Leaves smooth entire.*

[lanceolate smooth ovary
 13754 Leaves obovato-lanc. ent. emarg. smooth shining above, Catk. cylind. many-fl. Scales shorter than ovato-
 13755 Leaves obovate entire smooth shining above, Fem. catk. obl. of few-fl. Scales length of obl. smooth ovary
 13759 Lvs. ov. or ovato-lanc. acute ent. smooth shin. above, Catk. obl. of few-fls. Caps. ellipt. smooth, Stigm. sess.
 13757 Leaves orbicular somewhat ellipt. obt. entire coriaceous smooth with reticulated veins glaucous beneath,
 Stigmas nearly sessile, Capsule shaggy
 13758 Lvs. ovate entire bluish smooth glaucous beneath, Ovary ovato-lanc. smooth its stalk longer than scale
 13759 Leaves obov. lanc. acute entire glandular at edge smooth glaucous ben.: young ones silky, Stipules none
 13760 Stem depressed, Leaves spatulate obovate obtuse entire smooth shining above gland. at margin beneath,
 Stip. none, Catk. lax, Scales obl. fringed, Ovary stalked ovate smooth, Style deeply divid. Stigm. 2 lobed
 13761 Stem depressed, Leaves oval rather acute entire reticulated with veins heart-shaped at the base smooth
 above pale with a hairy rib and margin beneath, Stipules $\frac{1}{2}$ heart-shaped
 13762 Stem erect, Branches smooth, Lvs. obov. lanc. acute entire smooth, Stip. none, Catk. stalked very smooth,
 Scales oblong scarcely hairy, Ovary ovate obl. smooth its stalk twice as long as scale, Stigm. sess. divided

§ 3. *Leaves villous.*

[ovate woolly
 13763 Leaves nearly entire ellipt.-lanc. even and nearly smooth above woolly ben. Footst. decurrent, Ovary sess.
 13764 Leaves oblong lanceolate entire obtuse silky on each side, Caps. ovate oblong villous sessile
 13765 Leaves roundish ovate acute entire shaggy on both sides hoary beneath, Capsules sessile smooth, Style
 four times as long as the blunt divided stigmas
 13766 Leaves lanceolate entire bluish clothed on both sides with long silky hairs, Ovary sessile very woolly,
 Style about the length of the deeply separated cloven blunt stigmas
 13767 Leaves nearly entire ovate acute reticulated and somew. downy above veiny and densely woolly beneath,
 Ovary sessile very woolly, Style about the length of the deeply separated linear divided stigmas
 13768 Stem erect, Lower leaves entire: upper more or less serrated obovate lanc. reticulated with veins glaucous
 and downy ben. Stip. half heart-shaped serr. Ovary lanc. stalked silky, Style as long as blunt stigmas
 13769 Leaves ovate acute serrulate smooth above hairy beneath, Stipules minute, Catkins long
 13770 Leaves elliptical acute waved and slightly serrated nearly smooth glaucous beneath, Footstalks dilated at
 the base, Catkins before the leaves, Ovary stalked lanceolate silky
 13771 Leaves lanceolate sharpish nearly entire downy revolute veiny and rugose beneath, Stipules lanc. decid.
 Scales of the catk. oblong fringed, Ovary ovato-lanceolate silky stalked, Style short, Stigmas divided
 13772 Leaves elliptical entire tapering at each end polished: the veins beneath as well as the margin hairy, Ovary
 elliptical downy, Style elongated
 13773 Leaves entire elliptical som-what revolute with a recurved point rather downy above silky and shining
 beneath as well as the branches, Ovary stalked ovato-lanceolate silky, Style shorter than the stigmas
 13774 Leaves elliptical entire recurved acute above downy beneath silky, Ovary ovate lanceolate villous
 13775 Leaves brown above downy with short hairs hoary beneath acute nearly entire
 13776 Leaves obtuse brown smooth and opaque above silky beneath [ovate downy, Stem depressed
 13777 Lvs. ellipt.-lanc. straight somew. point. nearly ent. almost naked above glauc. and silky ben. Ovary stalked
 13778 Leaves ellipt.-obl. acute straight flat with a few glandular teeth glaucous and silky beneath, Footstalks
 slender, Stem erect much branched, Stipules none
 13779 Leaves elliptical acute convex rarely toothed glaucous rugged and silky beneath, Stem prost. Branches
 elongated straight, Ovary stalked ovate silky, Style shorter than the stigm.
 13780 Leaves elliptical acute finely downy on both sides glaucous beneath slightly serrated towards the point,
 Stipules very small, Catkins rather before the leaves ovate hairy
 13781 Leaves elliptical entire acute at each end reticulated with veins glaucous beneath most hairy at margin,
 Ovary somewhat stalked ovato-lanceolate villous, Style the length of the deeply divided stigm.
 13782 Leaves elliptical heart-shaped pointed finely notched downy on both sides, Stipules half heart-shaped
 flat-toothed nearly smooth, Branches hairy
 13783 Leaves elliptical acute slightly-toothed smooth, Young branches very smooth, Catkins ovate short erect,
 Ovary stalked ovate silky, Stigmas ovate obtuse nearly sessile
 13784 Lvs. ellipt. nearly ent. with recurv. points glaucous and silky ben. Stem decumbent, Stipules ovate entire
 13785 Lvs. ellipt.-obl. somew. serrat. with recurv. points glauc. and silky ben. Stem ascend. Stipules ovate serrated
 13786 Leaves lanc. pointed straight somewhat elliptical entire convex smooth above glaucous and silky beneath,
 Catkins oval erect, Ovary stalked lanceolate, Style the length of the stigma
 13787 Leaves linear-lanceolate pointed straight entire silky beneath, Stem erect, Stipules upright flat, Catkins
 recurved, Ovary stalked lanceolate silky

and Miscellaneous Particulars.

known; being only from one to three inches in height. *S. retusa* is nearly as little as *S. herbacea*. *S. vitellina* with its brilliant yellow bark, planted in shrubberies, contrasts well with evergreens and the purple twigg'd dogwood.

Almost all the willows are of the easiest propagation and culture. Plantations for basket-work or hoops should be made on deep loamy soil on the banks of rivers, within reach of water, but by no means saturated with it. Few willows are either bog or marsh plants. The cultivated species require as much attention as

History, Use, Propagation, Culture,

young trees in a nursery, otherwise they will soon become stunted and of irregular growth. Excellent directions for their culture may be found in Sang's Planter's Kalender.

2043. *Cecropia*. From *κικκρυα*, to cry out, a sort of translation of the English word trumpet-wood. This tree has the trunk and branches hollow every where, and sloped from space to space with membranaceous septas, and answering to so many annual marks in the surface. The leaves are large, peltate, lobed like those of *Carica Papaya*, and placed at the ends of the branches. The fruits rise four, five or more, from the very top of a common peduncle, and shoot into so many oblong cylindrical berries, composed of a row of little acini, something like our raspberry, which they resemble in flavor when ripe, and are agreeable to most European palates on that account. The wood of this tree, when dry, is very apt to take fire by attrition. The native Indians have taken the hint, and always kindle their fires in the woods by rubbing a piece of it against some

- 13788 Leaves linear-lanceolate with small glandular teeth entire at the base clothed with close-pressed hairs above downy and rugged with veins beneath, Ovary ovate smooth
- 13789 Leaves linear very narrow without stipules nearly entire ovate at the base hoary above silky beneath
- 13790 Leaves lanceolate pointed serr. smooth above glauc. and silky beneath, Caps. lanceolate stalked, Stigm. linear deflex. deciduous, Catk. before the leaves, Scales hairy, Ovary stalked oblong silky, Stigm. nearly sessile
- 13791 Leaves lanceolate-obovate with a recurved point serrated at the end clothed with depressed hairs above rugged veiny and downy beneath, Stipules lanceolate
- 13792 Leaves obovate lanceolate obtuse mucronate with a hooked point subserrate green above hoary beneath
- 13793 Leaves obovate with a recurved point with wavy serrat. at end green and downy above hoary and shaggy with rugged veins beneath, Stip. $\frac{1}{2}$ heart-shaped toothed, Caps. lanceolate stalked, Stigm. nearly sessile
- 13794 Lvs. slightly serrat. obov. -ellipt. downy flat rather glauc. ben. Stipules rounded tooth. Stigm. nearly sess.
- 13795 Lvs. obov. lanc. flat rather rigid minute. indent. ac. undern. glauc. and hairy, Stip. small notch. Catk. ellipt.
- 13796 Lvs. ellipt. almost circular slightly tooth. downy with rectang. veins ben. Style as long as notched stigmas
- 13797 Leaves entire elliptical acute even downy on both sides somewhat withered at the point, Stipules obsol. Ovary lanceolate silky on a long hairy stalk, Stigmas nearly sessile
- 13798 Leaves ovate pointed serrated waved downy beneath, Stipules somewhat crescent-shaped, Ovary ovate downy on a long hairy stalk, Stigmas undivided nearly sessile
- 13799 Leaves nearly entire lanceolate acute shaggy above densely silky beneath, Stigmas capillary deeply divided, Style as long as the ovary
- 13800 Leaves lanc. oblong pointed waved slightly downy beneath, Stipules kidney-shaped, Ovary ovate silky, Style the length of the linear stigmas
- 13801 Leaves oblong lanceolate acute distantly serrated smooth above flat and downy beneath, Stipules lunate somewhat toothed, Ovary stalked lanceolate silky, Style elongated, Stigm. deeply cloven
- 13802 Leaves linear inclining to lanceolate very long pointed entire somewhat wavy silky beneath, Branches straight and slender, Ovary sessile, Style as long as the undivided linear stigmas
- 13803 Leaves lanceolate pointed obovately crenate whitish and silky beneath, Stipules crescent-shaped minute, Stigmas linear deeply divided about the length of the style
- 13804 Leaves lanc. pointed obscurely crenate downy beneath, Stipules half heart-shaped very large, Nectary cylindrical, Stigmas linear undivided longer than the style
- 13805 Leaves linear lanceolate pointed revol. obscurely toothed downy above snow-white and cottony beneath, Stip. lanc. about the length of the footstalk, Scales of the catk. with hairs as long as the stamens
- 13806 Lvs. obl. lanc. ac. at each end nearly ent. without stipul. smooth. above downy ben. Ovary ovate lanc. silky
- 13807 Leaves elliptic-lanceolate acute serrated permanently silky on both sides: the lowest serratures glandular, Stamens hairy, Stigmas deeply cloven
- 13808 Lvs. lanc. taper-point. serrat. : under-side at length almost naked ; lowest serrat.gland. Stigm. deeply cloven
- 13809 Leaves obovate serrated flat even silky on both sides, Stipules hairy, Branches minutely downy, Ovary stalked awl-shaped silky, Style as long as the undivided stigmas
- 13810 Leaves elliptic obl. acute finely notched slightly downy paler beneath, Stipulas half-ovate nearly smooth, Branches minutely downy, Ovary stalked smooth, Style as long as the cloven stigmas
- 13811 Leaves elliptical obovate acute notched slightly downy glaucous beneath, Stipules vaulted, Branches minutely downy, Ovary stalked silky, Style longer than the thick undivided stigmas
- 13812 Lvs. obl. acute entire silky on each side hoary ben. Ovaries long-pointed lax, Scales very blunt smooth
- 13813 Lvs. lanc. acum. toothl. at end smooth above rugose and soft beneath, Caps. downy lanc. Stigmas sessile
- 13814 Leaves 2-lobed : lobes oblong bluntish hispid and rough above white and downy beneath
- 13815 Leaves oblong lanceolate obtuse sessile coriaceous revolute at edge dotted beneath
- 13816 Leaves ovate-lanceolate acute subsessile somewhat membranous
- 13817 Leaves ovate-lanceolate narrowed at each end stalked membranous serrulated
- 13818 Leaves $2\frac{1}{2}$ inches long 1 broad serrated
- 13819 Leaves acute serrulate very smooth shining opposite and alternate
- 13820 Leaves alternate tapered into a short stalk retuse emarginate mucronulate very smooth glaucous

and Miscellaneous Particulars.

harder wood. The bark is strong and fibrous, and is frequently used for all sorts of cordage. The trunk is very light, and for that reason much used for bark-logs and fishing-floats. The smaller branches, when cleaned of the sequins, serve for wind instruments. Both trunk and branches yield a great quantity of fixed salt, which is much used among the French, to despumate and granulate their sugars. The fruit is much fed upon by pigeons and other birds, and thus the tree is much spread and propagated. (*Brown.*) It may be increased like *Brosimum*.

2044. *Borya*. Named in honor of M. Bory de St. Vincent, a distinguished French traveller and naturalist, known not of the scientific world by the violence of his *liberal* opinions. Small bushes of North America, of little beauty. Sir James Smith has altered the name to *Bigelovia*.

2045. *Emptrum*. So called from the places of its natural growth, $\epsilon\gamma$, $\iota\alpha$, and $\pi\epsilon\tau\sigma\epsilon\varsigma$, a stone. *E. nigrum* is

History, Use, Propagation, Culture,

very common in the northern parts of Europe, in elevated situations, on dry, barren, moorish, or boggy soils. It is more patient of cold than even the common heath. The Highlanders' children eat the berries, but they are no very desirable fruit; and taken in large quantities, are said to bring on a slight head-ache. The Russian peasants, however, eat them, and the Kamtschadales gather great quantities of them to boil with their fish, or to make a sort of pudding with the bulbs of their lillies. They are esteemed antiscorbatic and diuretic. Grouse and heathcocks feed upon them, and they give the excrement a tinge of purple. Boiled in alum-water they afford a dark purple dye; and boiled with fat, they are said to be used in dyeing otter and sable skins black. Cattle do not seem to browse on this shrub. The French word *Camarine*, is an alteration of *Camarinas*, the Portuguese name of *E. album*.

2046. *Willdenovia*. A rush-like plant, with long flexible slender shoots, named in honor of Charles Louis Willdenow, a celebrated Prussian botanist, whose edition of Linnaeus's *Species Plantarum* is not only the best which has been published in modern days, but excellent in itself.

2047. *Restio*. From *restis*, cord; the supple shoots of many species are used as withs at the Cape of Good Hope. The houses of the Cape of Good Hope are commonly thatched with this plant both in town and country, and sometimes whole huts are built with it. A roof thatched with it will last twenty or thirty years, and would last much longer, if the south-east wind did not blow much dirt into it, which causes it to rot.

2048. *Elegia*. From *ἀεγος*, lamentation, in allusion to the sad or mourning color of the whole plant. A hard rushy plant, with the habit of a *Restio*.

2049. *Phoenix*. The Greek name of the date, and probably so called from Phenicia, whence the best dates were brought. *Dactylifera* is the Greek version of *Palma*, both signifying the hand, to the fingers of which the ancients likened the bunches of dates. *P. dactylifera* is a lofty palm, with a rugged trunk, on account of the persisting vestiges of the decayed leaves. These leaves, when the tree is grown to a size for bearing fruit, are six or eight feet long, with pinnae three feet long, and a little more than an inch broad. The flowers of both sexes come out in very long bunches from the trunk between the leaves, and are covered with a spathe, which opens and withers; those of the male have six short stamina, with narrow four-cornered anthers filled with farina. The female flowers have no stamina, but have a roundish germ, which afterwards becomes an oval berry, with a thick pulp enclosing a hard oblong stone, with a deep furrow running longitudinally. The fruit of this tree makes a great part of the diet of the inhabitants of Arabia and part of Persia. In Upper Egypt many families subsist almost entirely upon it. They make a conserve of it with sugar; and even grind the hard stones in their hand-mills for their camels. In Barbary they turn handsome beads for paternosters of these stones. The date is said to strengthen the stomach and intestines, to stop looseness, and promote expectoration, for which purpose it is given in pectoral decoctions. It is also recommended in the piles, given in red wine. From the leaves of the tree they make baskets or bags in Barbary. In Egypt they make fly-flaps of them, and brushes to clean their sofas or clothes. The hard boughs are used as fences to their gardens, and cages to carry their fowls to market. The trunk is split for the same purposes, and is even used in small buildings. It serves likewise for firing. The threads of the web-like integument between the

13823 Culm and branches round smooth

and Miscellaneous Particulars.

boughs make ropes and the rigging of smaller vessels. The juice of the date tree is procured by cutting off the head or crown of the more vigorous plant, and scooping the top of the trunk into the shape of a basin; where the sap in ascending lodges itself, at the rate of three or four quarts a day, during the first week or fortnight; after which, the quantity daily diminishes, and at the end of six weeks or two months the tree becomes dry, and serves for timber or firewood. This liquor, which has a more luscious sweetness than honey, is of the consistence of a thin syrup, but quickly becomes tart and rosy, acquiring an intoxicating quality, and giving upon distillation an agreeable spirit or araky, which is the general name in the East for all hot liquors extracted by the alembick.

P. farinifera produces black drupes of the size of a large kidney bean; these the natives of Coromandel eat as gathered from the bush without any preparation. The leaflets are wrought into mats; the common petioles are split into three or four, and used for making ordinary baskets of various kinds; but they are not so proper for this purpose as the bamboo. The small trunk, when divested of its leaves, and the strong brown fibrous web that surrounds the trunk at their insertions, is generally fifteen or eighteen inches long, and six in diameter at the thickest part; its exterior or woody part consists of white fibres matted together, which envelope a large quantity of farinaceous substance, used as food by the natives in times of scarcity; but to separate this from the fibres, the trunk is split into six or eight pieces, then dried, beaten in wooden mortars, and afterwards sifted: the rest of the preparation consists in boiling the meal into a thick gruel, or, as it is called in India, congee. It seems to be much less nutritive than sago, and is less palatable.

2050. *Atiago*. Perhaps so called from the length of the style; but the name is unexplained by its author. *S. diandra* produces an eatable fruit used by the natives, but not esteemed by Europeans. The species thrive in sandy loam, and cuttings root in sand under a hand-glass.

2051. *Osyris*. The Greek name of a tree with long supple branches, which were used for brushes and similar purposes. The modern shrub has also slender flexible branches, of which packing materials are formed throughout the south of Europe.

2052. *Aular*. From *αυλαξ*, a furrow; in allusion, we presume, to the furrows on the under-side of the leaves of the original species. Neat shrubs with narrow leaves; nearly allied to *Protea*. This, Sweet observes, is "a pretty genus belonging to the Proteaceæ, which thrives best in a very sandy loam, with a great many potsherds broken small at the bottom of the pot, to let the water drain off freely, as they frequently get too much water, which makes the mould sodden, and stagnates their growth. Ripened cuttings, taken off at a joint, and planted in a pot of sand, will strike root, if placed under a hand-glass in the propagating house, and the glass to be occasionally left off, an hour or two at a time, to give them air, and keep them from damping; which should be done in a morning before the sun has much power, or it will make them flag and injure them. Plants are readily raised from seeds, which should be sown in a mixture of two-thirds loam and one-third sand: as soon as they come up, they should be planted off in small pots, in the same kind of soil, as they are very apt to die, if left too long in the seed-pot." (*Bot. Cult.* 143.)

History, Use, Propagation, Culture,

2053. *Leucadendron*. From *λευκος*, white, and *δένδρον*, a tree, in allusion to the appearance of the most common species, No. 13,840. The species are evergreen shrubs, with handsome foliage; they grow in light soil well drained and not over watered, and are increased by ripened cuttings in sand under a hand-glass.

2054. *Viscum*. From the Latin *viscus*, clammy, on account of the sticky nature of the berries. *Gui*, Fr., *Mistle*, Ger., and *Visco*, Ital. This may be considered the only true parasitical plant indigenous to Britain, as at no period of its existence does it derive any nourishment from the soil like the misletoe, or from decayed bark or wood like certain Fungi, and other epiphytes. The root of the misletoe insinuates its fibres into the woody substance of the tree; the shoots are dichotomous, round, smooth, and even; and of a pale green, like the leaves, which are tongue-shaped and entire. The whole forms a pendant bush of from two to five feet in diameter, evergreen, and in winter covered with small white very glutinous berries. The British species of misletoe is commonly found on fruit trees; but it will grow on various others, as the thorn, oak, maple, poplar, lime, ash, &c.; and in the neighbourhood of Magdebourg it is abundant on *Pinus sylvestris*. It is not difficult to propagate by inserting the berries in slits in the bark early in spring, and tying a shred of mat over the slit to protect them from the birds. The Druids sent round their attendant youths with branches of the misletoe to announce the entrance of the new year; and something like the same custom is still continued in France. In England branches of it are hung up in most houses at Christmas, along with other evergreens. The berries are devoured by several birds of the thrush kind, and especially by the Mistletoe Thrush. Bird-lime is made from the berries, and also from the bark, boiled in water, beaten in a mortar and washed. It is, however, more commonly manufactured from the bark of the holly.

2055. *Myrica*. The Greek (*μυρική*) synonym of the Tamarisk. It is said to have been derived from *μυρα*, to flow, because the plants are always found on the banks of rivers, and in inundated spots. *M. Gale* has leaves of a bitter taste, but fragrant like those of the myrtle. Their essential oil rises in distillation. The northern nations formerly used this plant instead of hops, and it is still in use for that purpose in some of the western isles, and a few places in the Highlands of Scotland. Unless it be boiled a long time, it is reported to occasion head-ache. The catkins or cones boiled in water throw up a scum resembling bees' wax, which gathered in sufficient quantities would make candles. It is used to tan calf-skins. Gathered in the autumn it dyes wool

- 13840 Arboresecent, Leaves lanceolate silky, Branches villous, Bractes short downy, Cal. silky
 13841 Shrubby, Leaves linear lanceolate oblique smoothish, Male cal. smooth: female feathery, Fruit villous
 13842 Lvs. lanc. lin. smooth rounded at base, Branches vill. Scales of cone silky cuneate, Fruit comose mucronate
 13843 Leaves oval lanceolate: when old smooth, Scales of cone dilated-cuneate silky
 13844 Leaves spatulate callous at end, and branches villous, Fruit comose pointless
 13845 Leaves linear spatulate tapering at base and branches smooth, Male head sessile larger than leaves
 13846 Leaves linear lanceolate smooth: the younger straight tapering at base, Female head shorter than leaves
 13847 Leaves linear bluntish twisted smooth, Branchlets somewhat silky, Cal. silky, Fruit comose pointless
 13848 Leaves spatulate linear silky with a callous beard at end, Cal. very shaggy, Fruit cuneate downy
 13849 Lvs. lin. acute channelled imbricated erect smooth, Scales of cone acute recurved, Fruit orboid. ciliated
 13850 Lvs. obl. veinly callous at end recurved smoothish: floral colored $\frac{1}{2}$ scarious, Scales of cone downy outside
 13851 Leaves spatulate obl. callous at end smooth, Branches downy, Scales of cone retuse ciliated downy at base
 13852 Lvs. lanc. obl. callous at end smooth: floral colored, Branches somewhat downy, Scales ovate obt. smooth
 13853 Lvs. spatul. lanc. call. at end subdecurrent concave and branches smooth, Scales of cone roundish smoothish
 13854 Lvs. lin. lanc. mucron. finally smooth, Invol. ov. ac. longer than head, Scales of cone round. dilated smooth
 13855 Lvs. lin. acute with transparent edges and branches quite smooth: floral lin. lanc. long, Fr. winged emargin.
 13856 Leaves linear lanceolate acute: floral lanceolate colored concave, Shrub low with ascending branches
 13857 Lvs. obl. lanceolate bluntish veinless and branches quite smooth: floral $\frac{2}{3}$ -colored, Fruit winged emarginate
 13858 Leaves linear lanceolate cuspidate somewhat silky: floral lanceolate colored, Frunt very narrow winged
 13859 Leaves lanc. lin. silky with down on each side with callous points at end, Branches downy, Calyx hairy
 13860 Lvs. lanc. lin. silky with down on each side with call. points at end, Branches shag. Cal. of male hairy in lines
 13861 Upp. lvs. lanc. spatul. ac. rugose, Cones ov. Scales cohering at base distinct above with recurv. beard. edges
 13862 Lvs. all filiform chann. bluntish smooth spreading incurved, Scales cohering at base distinct above 2-lobed
 13863 Lvs. all filiform channelled acute imbric. straightish ciliated, Scales cohering at base distinct above 2-lobed

13864 Leaves lanceolate obtuse, Stem dichotomous, Heads of flowers axillary

- 13865 Leaves lanceolate broader upwards serrated, Stem shrubby
 13866 Leaves oblong narrowed at base subserrate at end, Scales of male catkins acute, Berries globose
 13867 Leaves oblong narrowed at base coarsely serrated, Scales of male catkins acute, Berries globose
 13868 Leaves oblong acute at each end entire or slightly serrated at end revolute at edge
 13869 Leaves elliptical lanceolate subserrate, Male catkins compound, Drupe with a 4 celled nucleus
 13870 Leaves elliptical toothed: the lowest quite entire
 13871 Leaves lanceolate unequally acuminate serrated, Catkins long lax
 13872 Leaves oblong deeply sinuated smooth
 13873 Leaves oblong oppositely sinuated hairy
 13874 Leaves subcordate serrate sessile
 13875 Leaves oblong lanc. cuneate tapered at base nearly entire smooth shining with the middle nerve downy
 13876 Leaves lanceolate entire netted with veins, Catkins few-flowered lax

and Miscellaneous Particulars.

yellow, and is used for that purpose both in Sweden and Wales. The Swedes sometimes use a strong decoction of it to kill bugs and lice, and to cure the itch. The Welsh lay branches of it upon and under their beds to keep off fleas and moths, and give it as a vermifuge in powder and infusion, applying it also externally to the abdomen. In most of the Hebrides, as well as in the Highlands of Scotland, an infusion of the leaves is frequently given to children to destroy the worms. In Isla and Jura the inhabitants garnish their dishes with it, and lay it between their linen and other garments to give them a fine scent, and to drive away moths. When it grows within reach of a port, the sailors make besoms of it for sweeping their ships. In the isle of Ely they make faggots with it to heat their ovens. Linnæus was induced to suspect, from the smell of this shrub, that camphor might possibly be prepared from it. Horses and goats eat; sheep and cows refuse it.

M. cerifera may be used for most of the purposes of the former species. Candles are made from the berries in North America, whence it is called there the tallow shrub or candleberry tree; some also name it the bayberry-bush. It grows abundantly on a wet soil, and seems to thrive particularly well in the neighbourhood of the sea, nor does it seem ever to be found high up in the country. The berries intended for making candles are gathered late in autumn, and are thrown into a pot of boiling water; their fat melts out, floats at the top of the water, and may be skimmed off. The fat when congealed looks like tallow or wax, but has a dirty green color, it is therefore melted again and refined, by which means it acquires a fine and pretty transparent green color. It is dearer than common tallow, but cheaper than wax. They usually mix some tallow with it. Candles of this kind do not easily burn or melt in summer as common candles do; they burn better and slower, nor do they cause any smoke, but rather yield an agreeable smell when they are extinguished. At present not many candles of this kind are used, the animal tallow is readily come at, it being very troublesome to gather the berries. They are chiefly used by poor people, who live near where the bushes grow, and have not cattle enough to supply them. A soap is made from the fat which has an agreeable scent, and is excellent for shaving; and it is used by surgeons for plasters. In Carolina they likewise make sealing-wax from these berries. The root is accounted a specific in the tooth-ache.

All the species grow well in peat soil or sandy loam, in a moist situation. They are increased by seeds or layers, but not readily by cuttings.

History, Use, Propagation, Culture,

2056. *Nageia*. *Nagi* is the Japanese name of one of the species. That in the gardens is an uninteresting shrub with a loose elegant foliage, and a light grey bark. Ripened cuttings strike freely in a bark pit.

2057. *Shepherdia*. A name given by Nuttall to the *Hippophae canadensis* of our gardens, in honor of Mr. William Shepherd, the worthy curator of the Liverpool botanic garden. A small inelegant tree, with dark green deciduous leaves, covered over with brownish silvery scales on the lower side.

2058. *Hippophae*. An ancient name given to some plant now unknown, which was applied medicinally to horses; from ἵππος, a horse, and εἶω, to give light. *H. rhamnoides* is very prolific in berries, which are yellow when ripe, succulent, smooth, and gratefully acid to the taste. They are much eaten by the Tartars; and the fishermen of the Gulph of Bothnia prepare a rob from them, which imparts a grateful flavor to fresh fish. Every part of the plant will dye yellow. The species grow in common soil, and are readily increased by layers or cuttings of the roots.

2059. *Broussonetia*. Named by L'Heritier, in honor of his countryman P. N. V. Broussonet, a well known naturalist, who travelled in Barbary, and published an *Ichthyologia* in 1782. This is a vigorous growing shrub or low tree, with large lobed leaves, variously shaped; the foliage of the male and female plant differing so much from each other that they might easily be taken for distinct species. The fruit is little larger than peas, and from the bark the Chinese make paper, and the Otaheiteans cloth.

B. papyrifera, though a low tree, produces vigorous shoots, furnished with large leaves. The fruit is little larger than peas, surrounded with long purple hairs, when ripe changing to a black purple color, and full of sweet juice. In China and Japan it is cultivated as we do osiers, for the sake of the young shoots, from the bark of which the inhabitants of the east countries make paper. The bark being separated from the wood is steeped in water, and the inner bark separated from the outer; the former making the whitest and best paper. The bark is next slowly boiled, then washed, and afterwards put on a wooden table and beaten into a pulp. This pulp being put in water, separates like grains of meal. An infusion of rice and the root of manihot is next added to it. From the liquor so prepared, the sheets of paper are poured out one by one, and when pressed, the operation is finished.

The juice of this tree is sufficiently tenacious to be used in China as a glue, in gilding either leather or paper. The finest and whitest cloth worn by the principal people at Otaheite and in the Sandwich Islands is made of the bark of this tree. The cloth of the Bread-fruit tree is inferior in whiteness and softness, and worn chiefly by the common people.

2060. *Schæfferia*. So called after James Christian Schæffer, a German naturalist of celebrity, who is best known by his excellent work on the Fungi of Bavaria, published in 1762. An inelegant shrub with green flowers.

13877 Leaves ovate lanceolate oblique at base finely and simply serrated smooth

13878 Leaves oblong stellate-hairy above brownish white and scaly beneath

13879 Leaves linear-lanceolate smooth above white with scales beneath

13880 Leaves 3-5-lobed acuminate serrated scabrous

13881 Leaves cucullate entire

13882 Flowers tetrapetalous axillary

13883 Leaves opposite stalked pinnated with an odd one of 5 or 6 pairs

13884 Leaflets serrated villous beneath, Racemes often compound

13885 Leaves somewhat whorled linear smooth

13886 Unarmed, Leaves oblong acum. entire smooth, Fruit 1-seeded cornute, Horns reflexed shorter than fruit

13887 Unarmed, Leaves obovate oblong acuminate unequally serrate very scabrous on each side

13888 Leaves alternate oblong oval, Fl. solitary

PENTANDRIA.

13889 Leaves pinnated with an odd one, Leaflets 5 ovate tapered at base rather acute and mucronate at end

13890 Leaves pinnate and ternate, Leaflets roundish narrowed at base netted with veins retuse mucronate

13891 Leaves pinnate with an odd one, Leaflets about 7 ovate-lanceolate rounded at base acute mucronate

13892 Leaves pinnate with an odd one, Leaflets lanceolate about 9, Petiole winged between the terminal pair

and Miscellaneous Particulars.

2061. *Brucea*. Named in honor of James Bruce, a celebrated Scotch traveller in Abyssinia, who discovered the plant.

2062. *Anthospermum*. From $\alpha\nu\theta\omicron\varsigma$, a flower, and $\sigma\pi\epsilon\rho\mu$, seed; its female flower is entirely naked, consisting of a single ovarium; whence its name. A heath-looking evergreen, the leaves of which are fragrant when bruised, and the propagation and culture of the easiest description.

2063. *Tro his*. From $\tau\rho\epsilon\tau\omega$ to nourish. *T. americana* produces berries about the size of large grapes, and of an agreeable pleasant flavor. The leaves and twigs are used as fodder for cattle when grass is scarce. Cuttings root in sand under a glass.

2064. *Montinia*. In honor of Laurence Montin, a Swede, who published a little tract upon Splanchnum. The specific name seems to hint at the nature of his disposition. A little worthless weed-like Cape plant.

2065. *Pistacia*. Said by Forskahl to have been altered by the Latins from its Arabic name *foustaq*. *P. officinalis* abounds in Sicily, where it is cultivated for its nuts. The male flowers come out from the side of the branches in loose bunches, and are of an herbaceous color. The female flowers come out in the same manner in clusters. The male puts forth its flowers first, and some gardeners pluck them whilst yet shut, dry them, and afterwards sprinkle the pollen over the female tree; but the method usually followed in Sicily, when the trees are far asunder, is to wait till the female buds are open, and then to gather bunches of male blossoms ready to blow; these are stuck into a pot of moist mould, and hung upon the female tree till they are quite dry and empty. This operation is called *tuchiarare*, and never fails to produce fructification; sometimes the gardeners ingraft the male bud upon the female tree.

P. terebinthus (from $\tau\rho\epsilon\beta\iota\eta\sigma\alpha$, to cut) furnishes the Cyprus turpentine. It is procured by wounding the bark of the trunk in several places, during the month of July, leaving a space of about three inches between the wounds; from these the turpentine is received on stones, upon which it becomes so much condensed by the coldness of the night, as to admit of being scraped off with a knife, which is always done before sunrise; in order to free it from all extraneous admixture, it is again liquified by the sun's heat, and passed through a strainer; it is then fit for use. The quantity produced is very inconsiderable; four large trees, sixty years old, only yielding two pounds nine ounces and six drachms; but in the eastern part of Cyprus and Chio, the trees afford somewhat more, though still so little as to render it very costly, and on this account it is commonly adulterated, especially with other turpentines. The best Chio turpentine is generally about the consistency of thick honey, very tenacious, clear, and almost transparent, white, inclining to yellow, and of a fragrant smell, moderately warm to the taste, but free from acrimony and bitterness.

P. lentiscus (*lentiscere*, to be sticky) produces the mastick, which is obtained most abundantly, by making transverse incisions in the bark of the tree, whence the mastick exudes in drops, which are suffered

History, Use, Propagation, Culture.

to run down to the ground, and after they are concreted they are collected for use. These incisions are made at the beginning of August, when the weather is very dry, and are continued till the end of September.

Turpentine and mastick are considered as astringent and diuretic; but though they retain a place in our Materia Medica, they are not much used by modern practitioners. Mastick is used by the Turkish and Armenian women as a masticatory for cleaning the teeth and giving an agreeable smell to the breath. It is also employed to fill the cavities of carious teeth. (*Thom. Lond. Disp.* 44.)

2066. *Xanthoxylum.* From ξανθός, yellow, and ξύλον, wood. X. Clava-Herculis is esteemed a good timber tree in Jamaica; and an infusion of the leaves is used to cure the tooth-ach there and in Carolina. All the species may be increased by ripened cuttings, or by cuttings of the roots.

2067. *Picramnia.* From πικρός, bitter. A small tree with fruit the size of a gooseberry, and pinnate leaves; the whole plant abounding in the bitter principle. Large cuttings strike freely in sand under a hand-glass.

2068. *Antidesma.* So called from the use of the bark in making ropes; from αβρι, like, and δερμας, a bond. A. alexiteria is a middle-sized evergreen tree, with leaves resembling those of the lemon, and fruit in racemes, red and acid like the barberry. A decoction of the leaves is reputed to be an antidote against the bite of serpents, and the bark is used for making ropes. All the species require a rich loamy soil, and ripened cuttings with their leaves on root in sand in a moist heat.

2069. *Iresine.* Supplants were accustomed among the Greeks to present themselves before the altar with a branch of olive bound with wool, which offering they called *αεθριον*; whence this plant, which is very like such a branch, on account of its close clusters of woolly flowers, has been named. Herbaceous plants not of great beauty.

2070. *Spinacia.* From *spina*, a prickle, on account of the processes of the seed. A well known annual esculent of the easiest culture in any rich soil.

2071. *Fluggea.* Named by Willdenow, in honor of — Flügge, a German Cryptogamic botanist. A shrub with round ash-colored spiny branches. The spines are from one and a half to three inches long, very strong and numerous, whitish, and covered with leaves.

2072. *Acnida.* From α, privative, and *ανιδνα*, a Greek name of the nettle; that is to say, a nettle-like plant, which does not sting.

2073. *Cannabis.* According to Bullet, this name is taken from the Celtic *can*, a reed, and *ab*, small. But Gohus says, the plant has been known by the Arabs from time immemorial under the name of *ganab*. The hemp is a manufacturing plant of equal antiquity with the flax. It grows to a great height on rich soils under a warm climate; in some parts of Italy it has been found eighteen feet high (*Cruuds. Agr.*); the common height in Lombardy and the Bolognese territory is twelve feet; in this country it seldom exceeds six feet, and the fibre of British hemp is no finer than where it is three times the length. The culture, management, and uses of hemp are nearly the same as those of flax; but the male and female flowers being on different plants, and the male plant decaying long before the female, the former requires to be pulled up as soon as the setting of the seed in the females shews that they have effected their purpose. Hemp is sown on well prepared

13893 Leaves abruptly pinnate, Leaflets lanceolate about 8, Petiole winged

13894 Unarmed, Leaves pinnate of 2 or 3 pair, Leaflets ovate emarginate villous, Racemes terminal

13895 Prickly, Leaves pinnate of 4 pair, Leaflets ovate repand-toothed unequal at base sessile, Panicles terminal

13896 Lvs. pinn. with an odd one of 4-5 pair, Leaf. ov. obsoletely serrul. equal at base, Petiol. rounded unarmed

13897 Lvs. pinn. with odd 1 of 3-5 pair, Leaf. stalk. obl. oval acum. serrul. obliq. at base, Petiol. and branch. prickly

13898 Branches petioles and ribs prickly, Leaves pinnate with an odd one of 2-3 pairs, Leaflets oblong sinning with remote glandular crenatures

13899 Racemes filiform pendulous, Flowers triandrous, Styles 2 recurved

13900 Lvs. obl. narrowed at base acum. at end smooth shining on each side, Racemes axillary twin or solitary

13901 Lvs. roundish ellipt. rounded at each end retuse emarginate at point downy beneath, Racem. term. panicled

13902 Leaves dotted scabrous: lower oblong acuminate; upper ovate-lanceolate, Panicle branched compact

13903 Leaves ovate-oblong acute, Panicle erect, Branches simple, Stem furrowed

13904 Leaves ovate smooth cuspidate, Panicle diffuse branched, Stem furrowed

13905 Leaves sagittate, Fruit sessile

13906 The only species. Leaves alternate orbic ovate entire smooth, Spines 2 or 3 inches long

13907 Leaves lanceolate, Capsules smoothish acutangular

13908 The only species

13909 The only species

and Miscellaneous Particulars.

In many soil about the end of April: the male plants are generally pulled about the beginning of July, and the females four or five weeks after them, when they have ripened their seeds. The plants being tied in bundles, are watered and bleached, in the same manner as flax; or they are dried and stacked without having gone through this process, and the fibres separated when wanted by the flax-breaking machine of recent invention, or by steeping in hot water and soft soap. The produce of hemp in fibre varies from three to six hundred weight per acre; in seed, from eleven to twelve bushels. The fibre produces a cloth stronger than that from flax, and the best of all cordage and ropes. An oil is extracted from the seeds of hemp, which is used in cookery in Russia, and in this country by painters. The seeds themselves are reckoned a good food for poultry, and are supposed to occasion hens to lay a greater quantity of eggs. Small birds in general are very fond of them, but they should be given to caged birds with caution, and mixed with other seeds. A very singular effect is recorded, on very good authority, to have been sometimes produced by feeding bullfinches and goldfinches on hemp-seed alone, or in too great quantity; viz. that of changing the red and yellow on these birds to a total blackness. (*Ency. of Agr.* 5327.)

2074. *Humulus*. From *humus*, fresh earth; the hop grows only in rich soils. Our English word *hop*, seems to be the Anglo-Saxon *hoppan*, to climb. *Lupulus* is a contraction of *Lupus salictarius*, the name by which it was, according to Pliny, formerly called, because it grew among the willows, to which, by twining round and choking up, it proved as destructive as the wolf to the flock.

The hop has been cultivated in Europe an unknown length of time for its flowers, which are used for preserving beer. Its culture was introduced from Flanders in the reign of Henry VIII., though indigenous both in Scotland and Ireland: it is little cultivated in those countries, owing to the humidity of their autumnal season. Like other plants of this sort, the hop bears its flowers on different individuals; the female plant, therefore, is alone cultivated. There are several varieties grown in Kent and Surrey under the names of Flemish, Canterbury, Goldings, &c.; the first is the most hardy, differing little from the wild or hedge-hop; the Goldings is a very improved and highly productive variety, but more subject to the blight than the other. The hop prefers a deep loamy soil on a dry bottom; a sheltered situation exposed to the south or south-west, but at the same time not so confined as to prevent a free circulation of air. The soil requires to be well pulverized and manured previously to planting. In hop districts, the ground is generally trenched either with the plough or spade. The mode of planting is generally in rows, six feet apart, and the same distance in the row. Five, six, or seven plants are generally placed together in a circular form, and at a distance of five or six feet from each other. The plants or cuttings are procured from the most healthy of the old stools; each should have two joints or buds; from the one which is placed in the ground springs the root, and from the other the stalk. Some plant the cuttings at once where they are to remain, and by others they are nursed a year in a garden. An interval crop of beans or cabbages is generally taken the first year. Sometimes no poles are placed at the plants till the second year, and then only short ones of five or six feet. The third year the hop generally comes into full bearing, and then from four to six poles from fourteen to sixteen feet in length are placed to each hill. The most durable timber for poles is that of the Spanish chesnut, which is much grown

History, Use, Propagation, Culture.

In Kent as coppice wood for that purpose. The after-culture of the hop consists in stirring the soil, and keeping it free from weeds; in guiding the shoots to the poles, and sometimes tying them for that purpose with withered rushes; in eradicating any superfluous shoots which may arise from the root, and in raising a small heap of earth over the root to prevent any more shoots from arising.

Hops are known to be ready for gathering, when the chaffy capsules acquire a brown color, and a firm consistence. Each chaffy capsule or leafed calyx contains one seed. Before these are picked, the poles with the attached stalks are pulled up, and placed horizontally on frames of wood, two or three poles at a time. The hops are then picked off by women and children. After being carefully separated from the leaves and stalks; they are dropped into a large cloth hung all round within the frame on tenter-hooks. When the cloth is full, the hops are emptied into a large sack, which is carried home, and the hops laid on a kiln to be dried. This is always done as soon as possible after they are picked, as they are apt to sustain considerable damage, both in color and flavor, if allowed to remain long in sacks in the green state in which they are pulled. In very warm weather, and when they are pulled in a moist state, they will often heat in five or six hours: for this reason the kilns are kept constantly at work, both night and day, from the commencement to the conclusion of the hop-picking season. The operation of drying hops is not materially different from that of drying malt, and the kilns are of the same construction. The hops are spread on a hair-cloth, from eight to twelve inches deep, according as the season is dry or wet, and the hops ripe or immature. When the ends of the hopstalks become quite shrivelled and dry, they are taken off the kiln and laid on a boarded floor till they become quite cool, when they are put into bags.

The bagging of hops is thus performed: in the floor of the room where hops are laid to cool, there is a round hole or trap, equal in size to the mouth of a hop-bag. After tying a handful of hops in each of the lower corners of a large bag, which serve afterwards for handles, the mouth of the bag is fixed securely to a strong hoop, which is made to rest on the edges of the hole or trap; and the bag itself being then dropped through the trap, the packer goes into it, when a person who attends for the purpose, puts in the hops in small quantities, in order to give the packer an opportunity of packing and trampling them as hard as possible. When the bag is filled, and the hops trampled in so hard as that it will hold no more, it is drawn up, unloosed from the hoop, and the end sewed up, other two handles having been previously formed in the corners in the manner mentioned above. The brightest and finest colored hops are put into pockets or fine bagging, and the brown into coarse or heavy bagging. The former are chiefly used for brewing fine ales, and the latter by the porter brewers. But when hops are intended to be kept two or three years, they are put into bags of strong cloth, and firmly pressed so as to exclude the air.

The stripping and stacking of the poles succeeds to the operation of picking. The shoots or bind being stripped off, such poles as are not decayed are set up together in a conical pile of three or four hundred, the centre of which is formed by three stout poles bound together a few feet from their tops, and their lower ends spread out.

The produce of no crop is so liable to variation as that of the hop; in a good season an acre will produce 20 cwt.; in a bad season none, or only 2 or 3 cwt. From 10 to 12 cwt. in a season is considered a tolerable average

13910 Leaves entire 3-7-lobed without glands cordate at base

and Miscellaneous Particulars

crop. The quality of hops is estimated by the abundance or scarcity of an unctuous clammy powder which adheres to them, and by their bright yellow color.

The expenses of forming a hop plantation are very great; but once in bearing, it will continue so for ten or fifteen years before it requires to be renewed. The hop culture in England, like that of the culture of the vine in France, is only calculated for cultivators of considerable capital, who can retain the produce from years of abundance to years of scarcity. It is calculated on an average, that the hop crop fails almost entirely every fifth year, when the price will rise from two to thirty pounds per cwt. To those who can cultivate and preserve the hop with a view to such a rise, few crops will be equally profitable.

The hop is peculiarly liable to diseases; when young it is devoured by fleas of different kinds; at a more advanced stage it is attacked by the green fly, red spider, and other moth, the larvae of which prey even upon its roots. The honey dew often materially injures the hop crop; and the mould, the fireblast, and other blights injure it at different times towards the latter periods of the growth of the plants.

The use of hop in brewing is to prevent the beer from becoming sour, and this is the grand purpose for which it is cultivated. But the young shoots both of the wild and improved hops are eaten early in the spring as asparagus, and were formerly brought to market for that purpose. The stalk and leaves will dye wool yellow. From the stalks a strong cloth is made in Sweden, the mode of preparing which is described by Linnæus in his Flora Suecica. A decoction of the roots is said to be as good a sudorific as Sarsaparilla; and the smell of the flowers is soporific. During the illness of George the third, in 1787, a pillow filled with hops was used instead of opiates.

2075. *Nodocca*, is an Indian word by which two or three species of this genus appear in the Hortus Malabaricus, and has been adopted as a generic name by Lamarck. A curious plant resembling a bryony, of easy culture and propagation.

2076. *Xerotes*. From ξηρος, dry, on account of the aridity of the herbage and of the situations in which it grows.

2077. *Elais*. The natives of Guinea express oil from the fruit of this, as the Greeks from their olives, ελαια, whence its name. This palm bears a fruit about the size of a large plum. The inhabitants of the West India Islands draw an oil from it, by the same process used in extracting oil from olives. From the sap an inebriating liquor is fermented, and the negroes weave the leaves into mats, on which they repose.

2078. *Chamaedorea*. Named, we presume, from χαμαι, dwarf, and δωρεα, a gift: but we are ignorant of the sense in which the name has been applied.

2079. *Borassus*. This is one of the names which were applied to the spatha of the date; and was applied by Linnæus to the designation of this family of palms. The fruit of this palm is of the size and shape of a child's head; a wine and a sugar are made from the sap of the trunk.

2080. *Mauritia*. Named in honor of Prince Maurice of Nassau, the patron of Piso, for whom he obtained the necessary aid towards publishing his Natural History of Brazil. A fine genus of palms.

2081. *Smilax*. From σμιλαξ, a grater; the stems are rough with stiff prickles. *S. aspera* has roots not unlike those of the Sarsaparilla. They have the same qualities, but in an inferior degree; and may be distinguished by

History, Use, Propagation, Culture,

being larger, more porous, and much less compressed. *S. Sarsaparilla* (*zarza*, furze, Spanish) has long slender roots covered with a wrinkled brown bark, white within, and having a small woody heart. It is inodorous, and has a mucilaginous very slightly bitter taste. Medicinally it is demulcent and diuretic. It was brought to Europe about the year 1530, and introduced as a medicine of great efficacy in the cure of lues venerea; but it fell into disrepute and was little used, till it was again brought into esteem by Dr. William Hunter and Sir William Fordyce, about the middle of the last century; not, however, as a remedy fitted to cure syphilis, but of much efficacy in rendering a mercurial course more certain, and after the use of mercury. Experience, however, has not verified the encomiums bestowed on it; and the extensive observations of Mr. Pearson have fixed the degree of benefit which is to be expected from this root in syphilitic complaints. The contagious matter and the mineral specific may, he observes, jointly produce, in certain habits of body, a new series of symptoms, which, strictly speaking, are not venereal, which cannot be cured by mercury, and which are sometimes more to be dreaded than the simple and natural effects of the venereal virus. Some of the most formidable of these appearances may be removed by sarsaparilla, the venereal virus still remaining in the system; and when the force of the poison has been completely subdued by mercury, the same vegetable is also capable of freeing the patient from what may be called the sequelæ of a mercurial course. Sarsaparilla is also recommended in scrophula, elephantiasis, or cutaneous affections resembling it, and in chronic rheumatism; but its efficacy is doubtful. (*Thom. Lond. Disp.* 505.)

S. China has roots as long as a child's hand, twisted, full of knots, reddish on the outside, flesh-colored in the heart, and destitute of smell. It is employed both as food and medicine in China, and to feed hogs in the West Indies. None of the species are of much beauty or worth growing, but as objects of curiosity.

2082. *Tamus*. This name was employed by Columella and others, for a plant resembling a vine, and bearing fruit not unlike grapes; a description which does not apply badly to the modern plant. *T. communis* has very large tubercous black coated masses attached to its roots. These are so acrid, that the pulp has been formerly used as a stimulating plaster. The young shoots, however, are so mild as to be good eating when dressed like asparagus. The Moors eat them boiled with oil and salt. The flowers of the female plant are succeeded by ovate smooth berries.

2083. *Testudinaria*. So called from the resemblance which the great rugged cracked root of this plant bears to the shell of a tortoise (*testudo*). The rootstock is a large fleshy mass, covered with a thick bark cracked deeply in every direction. The Hottentots in time of scarcity make use of the fleshy inside of the root as a sort of yam.

2084. *Rajania*. Named in honor of our distinguished countryman John Ray, a distinguished naturalist,

ana Miscellaneous Particulars.

born in 1628, died in 1705, and author of many works of the highest reputation. His zoological arrangement is still regarded with much respect. Twining plants resembling the Yam.

2085. *Dioscorea*. In memory of Pedacus Dioscorides, a Greek physician, born at Anazarba, in Cilicia. He is generally believed to have lived under Nero, but this is very uncertain. Abulfarrage makes him to have flourished under Ptolemæus Physon; but he is not generally credited. *D. sativa*, *Iguame*, Fr., and *Inhôme*, Portug, has large thick tubers, a foot broad, and palmated like some Orchises. The stalks are slender, and with the leaves bear some resemblance to black bryony. The yam is largely cultivated for food in Africa and the East and West Indies, especially in the latter for the negroes. The roots grow to a great size, are mealy, and esteemed to be easy of digestion; they are palatable, and not inferior to any roots now in use, either for delicacy of flavor or nutriment. They are eaten instead of bread, either roasted on the embers or boiled; the flower is also made into bread and puddings. In Otahete they make a dish, which they esteem very delicious, from the roots of the yam, with the kernel of the cocoa-nut scraped, and the pulp of the *Musa* or *Banana*. The juice of yam-roots fresh is acrid, and excites an itching on the skin. There are many varieties of these roots, some spreading out like the fingers (*Rumph. t. 121.*); others twisted like a serpent (*Rumph. t. 122.*); others again very small, scarcely weighing more than a pound, with a whitish ash-colored bark, whereas the bark is commonly black. The flesh of the yam is white or purplish, and viscid, but becomes farinaceous or mealy when dressed.

D. aculeata, by some considered only an improved variety of the *sativa*, is universally cultivated in the East and West Indies, in Africa, and in all the islands of the southern ocean within the torrid zone, and even as far as New Zealand. The tubers are frequently three feet long, and weigh thirty pounds. All the edible species and varieties are propagated in foreign countries like the common potatoe, but they arrive much sooner at maturity. The buds of the roots are not apparent, but still a small piece of skin is left to each set; for from this piece of bark alone the shoots proceed. Holes are made in rows two feet apart, and at eighteen inches distant in the row; into those holes two or three sets are put, first covered with earth, and then with a little haulm or rubbish to retain moisture. The only after-culture consists in hoeing up the weeds. They are commonly planted in August, and are ripe about the November or December following. When dug up, the greatest care is taken not to wound them, as that occasions them to sprout much earlier than they otherwise would do. They should be rubbed over with ashes, and piled regularly on beds or hurdles raised above the floor, that the air may come easily between them; or, if they be piled in heaps, some ashes should be strewed between the layers. None of the species are worth cultivating as ornamental plants; but some of the edible sorts have been raised in hotbeds in the Paris garden, and being transplanted early into a warm situation, have produced tubers of a considerable size.

History, Use, Propagation, Culture.

2085. Maba. The name given to the plant by the natives of Tonga-Tabu, according to Forster. (*Gen. 61.*) This shrub or small tree produces edible berries very well tasted. The wood is dark colored, remarkably hard and durable, and where its size will admit, is employed for such uses as require the most durable, compact, and heavy timber.

2086. Populus. In ancient times the public places of Rome were decorated with rows of this tree, whence it came to be called arbor *populi*, as being a tree peculiarly appropriated to the *people*. But Burret asserts, that the Poplar has obtained its name from the constant motion of the leaves, which are in a perpetual state of agitation like the *populace*. All the species are rapid-growing soft-wooded timber trees, some of which attain a very great size. *P. alba* is one of the most valuable of the British species. The leaves of the common gray poplar are of a blackish-green above, but having a thick white cotton underneath; they are about three inches long, on petioles a foot in length. The leaves of the Abele are about double the size, and divided into three, four, or five lobes. The leaves of the gray poplar are also larger more deeply lobed, and the under-side of the leaves and young shoots are covered with a hoary down. The Abele is said to have been introduced from Flanders, and the hoary poplar to have been originated in this country. The timber is of great value for all sorts of wooden vessels, especially butchers' trays. It is of quick growth, soft, white, and stringy, and little subject to swell or shrink. It makes beautiful floors and turners' ware. Some of the finest Abeles in England are at Hartwell near Aylesbury.

P. tremula is commonly called the asp, from the German *espe*, which is the general name for all poplars, is a rapid-growing tree in almost any soil or situation: but the numerous shoots of the roots spread so near the surface that they will not permit any thing else to grow there. The wood is extremely light, white, smooth, soft, and durable in the air. It may be used for the same purposes as that of the Abele. The bark is the favorite food of beavers. On the leaves and leafstalks may sometimes be seen red glandular substances about the size of a pea, which are the nests of *Tipula juniperina*. *P. nigra* has a naked lofty trunk covered with an ash-colored bark, and a regular handsome head. It is a tree of quick growth, and on the banks of rivers and in moist situations it grows up to a great height in a short time. The bark is light like cork, and is sometimes used by fishermen to float their nets. The timber is light and soft, fit for the turner and pattenmaker, and excellent for flooring-boards. These boards are much sower in taking fire than those of resinous trees; they smoke a long time before they burst into a flame: or course the wood is bad for fuel. Many species of insects are supported by this and the other poplars. The red substance like berries upon the leafstalks of this species are occasioned by the *Aphis Bursonia*. The leaves and young shoots are gathered in Sweden and other parts of Europe during the month of October and dried, to be given as fodder to the sheep in winter. The practice is as old as the time of the Romans; who, as well as the modern Italians, planted this tree for their vines to run on. In Kamchatka the inhabitants are sometimes reduced to the necessity of converting the inner bark into bread. Scheffer made paper from the cotton down of the seeds. The buds both of this and the white poplar smell very pleasant early in the spring, and being pressed between the fingers yield a balsamic resinous substance, which, extracted by spirits of wine, smells like storax. A drachm of this tincture in broth is administered in internal ulcers and excoerations.

The black Italian poplar, so much recommended by Pontey, and said by him to have been intro-

duced from America, seems intermediate between *P. nigra* and *dilatata*; indeed, all the three sorts are by some considered as but one species. *P. dilatata* differs from the common black poplar chiefly in its close conical manner of growth, which resembles the cypress. The leaves are greater in breadth than length; whereas in the black poplar the longitudinal diameter is the greatest. Though it generally attains a great height, the increase of the trunk is by no means so rapid as in most of the other poplars. It cannot, therefore, be highly recommended as a timber tree. In Italy it is considered peculiarly adapted for packing-boxes: and returns to its former position without splitting, which oak and other heavy woods will not do. In Lombardy all the vessels in which the grapes are carried home in carts from the vineyards, are of poplar plank, about two inches thick, and in them the grapes are squeezed. Such vessels last thirty or forty years; and by their lightness are manageable, however large and long. A four-wheeled cart is in general covered with one of them, and it contains about fifteen hundred weight of grapes, each hundred being a hundred pounds of thirty ounces. The conic form of the Lombardy poplar, as a deciduous tree, is peculiar. Among evergreens we find the same character in the cypress; and both trees, in many situations, have a good effect. The cypress often, among the ruins of ancient (and the buildings of modern) Rome, breaks the regularity of a wall or a pediment; and the poplar has the effect among deciduous trees of the round-headed kind. One beauty the Italian poplar possesses which is almost peculiar to it; and that is the waving line it forms when agitated by the wind. Most trees, in these circumstances, are partially agitated; one side is at rest while the other is in motion; but the Italian poplar waves in one single sweep from the top to the bottom, like an ostrich-feather on a lady's head. All the branches coincide in the motion, and the least blast makes an impression upon it when other trees are at rest.

P. balsamifera is a moderate sized conical tree, a native both of Siberia and America. The buds of this tree, from autumn to the leafing season, are covered with abundance of a glutinous yellow balsam, which often collects into drops, and is pressed from the tree for medical use. This balsam is brought to Europe from Canada in shells. It is smooth, of an even texture, a yellowish color, and a fragrant scent. In Siberia a medicated wine is prepared from the buds, which is diuretic, and esteemed by the inhabitants serviceable in the scurvy. The grouse and other birds of that family feeding on these buds during winter, acquire a flavor which is much esteemed by epicures. *P. canadensis* bears a general resemblance to the preceding species; and, like it, the buds are covered with a resinous tenacious balsam. The other American species are rapid-growing bulky timber-trees, well calculated for immediate effect and utility; but all the species being short-lived when compared with oaks, elms, and other slower-growing hard-wooded trees, confer a temporary premature character on landscape; for nothing can be great and lasting but what advances by degrees. Such poplars as do not grow freely from cuttings of the shoots, are most rapidly increased by cuttings of the roots; but the largest plants are produced from layers.

2087. *Mercurialis*. Mercury is said to have discovered the virtues of this plant. Eölmher, indeed, in his Lexicon, says, after Ambrosius, that the name is a corruption of *muliercularis*, as being useful to women; but the Greeks call it *ἰμερροα*, which is the same as *Mercurialis* in its mythological sense. *M. perennis* is not eaten by any quadruped, and is poisonous to men and sheep. The plant on being dried turns blue, and steeped in water it

History, Use, Propagation, Culture,

affords a fine deep blue color, destructible, however, both by acids and alkalis. It has been observed that the male and female plants are seldom found intermixed, each sort usually growing in large patches; whence it is probable that this plant, which increases much by the root, rarely produces perfect seeds. *M. annua* was formerly accounted medicinal; its seeds taste like those of hemp.

2089. *Hydrocharis*. From *ὕδωρ*, water, and *χαρις*, grace. This little plant is one of the prettiest ornaments of still waters. This plant increases by runners, which shoot out to a great length, and at the joints drop down long roots, which penetrate deep into the mud. The joints are furnished with pendulous buds, supported on long footstalks. The buds consist of two stipuleaceous scales folded together, within which are curiously enveloped the embryo leaves of the future plant.

2090. *Triplaris*. All the parts of the fructification are in threes or *triple*. *T. americana* is a tree forty feet high, with a dense pyramidal head. The leaves are oblong, entire, smooth, a span long. The branches are often hollow, and are then filled with an innumerable quantity of little red ants, which are often showered down upon any incautious traveller who may stand under the shade of the tree, and whom they bite severely. (*Bredemeyer*.)

2091. *Coriaria*. A tanner's plant; from *corium*, a hide. *Coriaria myrtifolia* has handsome leaves, but very little beauty in the flowers. It is considerably astringent, and is used not only in tanning leather, but in dying black colors. It produces abundance of suckers.

2092. *Kiggelaria*. Named after Francis Kiggelar, an obscure botanist, who lived at the end of the seventeenth century. An uninteresting plant. Ripened cuttings strike in heat under a hand-glass.

2093. *Schinus*. This was the Greek name of the *Pistacia Lentiscus*. It is now applied to an American genus which resembles *Pistacia* in sensible properties. The word *molle*, applied to one species, does not allude to any softness in the plant which bears the name, but is a slight alteration of the Peruvian word *mulli*. Fragrant shrubs with beautiful foliage, easily cultivated in a cold conservatory or out of doors in a warm sheltered place.

2094. *Gymnocladus*. From *γυμνος*, naked, and *κλαδος*, a shoot, on account of the naked appearance of its strange rigid shoots during the winter. This tree or shrub has pinnate leaves nearly a foot and a half long; both leaves and stalks are armed with thorns. The stalks at first grow erect, but afterwards twine about the neighbouring trees and shrubs. It is best propagated by cuttings of the roots.

13977 Stem suffruticose brachiate, Leaves elliptical acute at each end smooth glandular serrated

13992 Leaves linear lanceolate keeled prickly toothed

13993 Branches diffuse cinereous scarred, Leaves opposite 3 or 4-nate oblong retuse coriaceous?

13994 Leaves oblong or obovate flat

13995 Leaves obovate wavy

and Miscellaneous Particulars:

13995. *Carica*. According to Linnæus, because a native of Caria; but as the plant has no relation to that country, it would be better to adopt, with Jussieu, the specific name *Papaya* for the genus. *C. Papaya* rises with a thick soft herbaceous stem to the height of eighteen or twenty feet, naked till within two feet of the top, and having marks of the fallen leaves great part of its length. The leaves have long footstalks, are very large, and divided into many lobes. The whole plant abounds with a milky acrid juice, which is esteemed good for the ringworm. The male flowers, which are in loose clusters on long peduncles, are of a pure white, and have an agreeable odor. Sometimes these are succeeded by a small fruit about the size of a pear, which has occasioned some to suppose the male plant a distinct species. The flowers of the female have short peduncles; they are large and bell-shaped, composed of six yellow petals. When these drop off, the germ swells to a large fleshy fruit the size of a small melon. When ripe it is eaten by the inhabitants of the Caribbee Islands, but its flavor is very indifferent. The most common use of them is when they are about half grown, to soak them in salt water, to get out the milky juice, and pickle them as mangoes, for which they are considered a good substitute. The plant generally is said to have the property of intenerating animal fibre by suspension under its leaves or branches; but this quality wants confirmation. In our stoves the plants grow freely in loamy soil, and are increased by large cuttings with their leaves on in a moist heat.

13996. *Stratiotes*. From *στρατις*, a camp; in English, water-soldier; both names alluding to the military appearance of the plant, with its long sword-like leaves, and flowers which may be likened to plumes of white feathers. An aquatic plant, remaining the greatest part of the year immersed in water, but rising to flower. It increases with such rapidity as to become a troublesome weed in artificial pieces of water in which it is planted.

13997. *Hyenanche*. From *hyæna*, and *αγγη*, pain; because the fruit is used at the Cape of Good Hope to poison hyænas. A small tree, six or seven feet high, also called *Toxicodendron capense*. The flowers grow in axillary branched yellowish panicles, and are succeeded by smooth nuts, which, being pounded, are used to poison the carcasses of lambs, by which the hyænas are infallibly destroyed.

13998. *Euclea*. From *εὐκλεια*, glory or beauty; in allusion to the permanent beauty of the neat evergreen foliage of the plants. Shrubs or small trees, natives of the Cape of Good Hope. Of one species the berries are brought to the market of Cape Town for sale, and is the only kind of native fruit, except that of *Cissus capensis*, which is there eaten. Ripened cuttings root in sand under a glass.

History, Use, Propagation, Culture,

2099. *Datisca*. A word the meaning of which is unknown. The plant is of no beauty, and of the easiest culture. 2100. *Menispermum*. From *menes*, the moon, and *spisua*, seed; on account of the crescent-like form of the fruit. All the species are of the easiest propagation and culture.

The *M. palmatum* produces the famous Colombo root, which is so remarkable for the intensity of its bitter taste, and valuable on this account in dyspepsia, diarrhœa, dysentery, and as a wash for putrid sores.

2101. *Cocculus*. This word is derived from *coctus*, the name of the well-known dyers' insect, and has been applied to this genus on account of the resemblance which has been found to exist between that insect and the scarlet berries of the plant. A genus with the habit of *Menispermum*.

Cocculus Plukenetii produces berries and bunches like grapes, but smaller; first white, then red, and finally blackish purple. In the East Indies they are made up into a paste, and used to intoxicate fish, birds, and different sorts of vermin.

2102. *Flacourtia*. Named in honor of Etienne de Flacourt, a director of the French East India Company, and the commander of an expedition to Madagascar in 1648; of which he afterwards wrote an account, containing considerable details upon the botany of the country. L'Heritier dedicated to him the first species of the genus, which was found by him in Madagascar, where it is called *Ramontchi*. It is a thorny shrub or tree, with leaves and fruit resembling those of the plum. The fruit is green when young, of a beautiful red when ripe, and finally of a dark violet color: the skin is very thin, and the flesh transparent red, of the same consistence with our common plums; in the middle are a dozen or fourteen small kernels, the size of those in the apple, and nearly of the same shape; they are bitterish like our apricot kernels, and covered with a tender shell. The natives eat the fruit; it is sweet, but leaves a slight sharpness in the mouth. An island on the coast of Madagascar is covered with these trees; and because they resemble the European plum-tree, the sailors have named the island *Isle aux Prunes*, or Plum-tree Island. All the species grow freely in a mixture of loam and peat, and cuttings root in sand, plunged and covered.

2103. *Peumus*. The Chilian name of this plant is *Peumo*. It is the *Ruizia* of the *Flora Peruviana*, and forms an evergreen tree among the woods upon the sandy shores of Chili; it is valuable for its wood, which is very fragrant.

and Miscellaneous Particulars.

2194 *Gebonium*. So named by Roxburgh; but it is not known with what meaning. East Indian trees, with alternate leaves, the tubular stipular of a *Ficus*, and axillary flowers

2195. *Rottlera*. Named by Roxburgh, in honor of the Rev Dr Rottler, an East Indian botanist of reputation, who resided many years at Tranquebar in the character of a Danish missionary. *Rottlera tinctoria* is a native of the inland mountainous parts of the Circars of Hindostan, flowering in the cold season. Dr. Roxburgh never found it any where else. This is a middle-sized, erect, branching tree. Leaves alternate, stalked, elliptic, oblong, acute, entire, from four to eight inches in length, three-ribbed, and veiny; nearly smooth above; downy beneath, furnished at their base with two brown glands. Footstalks round, downy, from one to three inches long. Flowers small, in clusters about the tops of the branches, axillary, and terminal; the latter branched. Capsules the size of a small cherry, clothed with abundance of deep red granular powder, easily rubbed off. This powder is a valuable article of commerce, being much esteemed, especially among the Moors, for dyeing silk of a deep, bright, very beautiful and durable, full orange or flower color. When the capsules are ripe, in February or March, they are gathered, and the powder carefully brushed off. It is preserved without any further process, and is sold to the merchants trading to Hyderabad and other inland parts. This substance is but little acted upon by water, except with the admixture of alkaline salts, when it gives out a very deep blood-red color. To spirits it communicates a rich, deep, reddish flame color; but in neither instance does it dissolve, the grains remaining entire, like sand. The inhabitants know this powder by the name of *Wassunta-gunda*, and use it in the following manner:—To four parts of *Wassunta-gunda* are added one of alum, and two of salt of soda, native brilla. These are rubbed well together, with a portion of expressed oil of Sesamum, so small as hardly to be perceived. When well mixed, the whole is put into boiling water, in quantity proportioned to the silk which is to be dyed, and kept boiling smartly, more or less time, according to the shade required. The silk is turned frequently, to render the color uniform.

2196. *Cliffortia*. Named in honor of George Clifford, a Dutch gentleman; a great lover of plants, and one of the earliest of Linnæus's patrons. He had a superb garden at Hartcamp, of which Linnæus publishes the catalogue in one volume folio, in 1737. Shrubs of little beauty, except *C. pulchella*, which is exceedingly pretty; they are easily cultivated in a good greenhouse.

History, Use, Propagation, Culture,

2107. *Cycas*. A name employed by the ancients to designate a little palm which grew in Ethiopia. The modern plant is analogous to it. This genus, which seems intermediate between palms and ferns, produces the nutritive granulated powdered sago, from *sagu*, the name of a sort of bread made from the pith of the trunk in Tonquin. It is cultivated in China and Japan, and the fruit is eaten in the latter country. The tree, however, is chiefly valued for the pith of its trunk, which is full of white pith like that of the elder. The tree being cut down, this pith is beaten with a wooden pestle in a great mortar or trough; it is then strained, and the sediment, without farther preparation, constitutes sago. The native Indians live wholly upon it for three or four months in the year. That which is transported is dried and granulated. In our stoves these plants require the culture common to all the palm tribe; a rich loamy soil, plenty of pot-room, and a strong moist heat.

2108. *Zamia*. From *Ξαμα*, loss or damage. Pliny applied the name to the pine-cones of the fir, which, when suffered to decay upon the tree, injured the succeeding crop. The modern genus bears heads of flowers very like pine cones.

2109. *Latania*. The name of this plant in the Isle of Bourbon is *Latanier*. *L. borbonica* is a middle-sized palm with plaited fan-like fronds, which from the elongation of the axis and terminal lobe, seems as if pinnate. When young their middle nerve is downy; it afterwards becomes naked. The stalks of the leaves are spiny. The other species, *L. rubra*, is a much smaller plant, and is remarkable for its red livid leaves.

2110. *Leptocarpus*. From *λεπτος*, smooth, and *καετος*, fruit; with reference to the polished surface of the seeds. Rushy plants allied to *Restio*, and all natives of New Holland and the South Seas.

2111. *Ruscus*. Anciently *bruscus*, and derived, it is said, from *beus*, box, and *kelem*, holly, in Celtic; box-holly. The French at this day call one species *buis-Épineux* and *petit-houx*. *R. aculeatus* has thick white trifurcated roots, which strike deep into the ground, and send out fibres like those of asparagus. The stem is suffruticose, tough, stiff, and dark green; having many stiff sharp prickly pointed leaves. From the middle of the leaf above, comes out a single flower, on a very short pedicel: when it first appears it is the size and shape of a small pin's head; when expanded, composed of three outer calyxed leaves, and three inner ones con-

- 14019 Leaves ternate veinless smooth roundish elliptical: the middle one smaller obovate
 14020 Leaves ternate fascicled veiny hairy: lateral lanceolate entire; middle one obovate 3-toothed
 14021 Leaves ternate linear villous

- 14022 Fronds pinnated, Leaflets lanceolate linear acute 1-nerved flat
 14023 Fronds pinnated, Leaflets linear mucronate 1-nerved revolute at edge

- 14024 Fronds pinnat. Leaf. subul. spread, straight rigid mucron.: outer margin of base rounded, Stalk roundish [unarmed]
 14025 Fronds pinnated, Leaflets linear mucronate distichous: lower opposite, Stalk $\frac{1}{2}$ -round channelled downy
 14026 Fronds pinnated, Leaflets linear entire with a callous end twice emarginate obtuse, Stalk $\frac{1}{2}$ -round
 14027 Fronds pinnated, Leaflets linear lanc. blunt obsolete serrulate at end and flat, Stalk 3-cornered smooth
 14028 Fronds pinnated, Leaflets lanc. acute pointless serrated at end, Stalk 3-cornered smooth
 14029 Fronds pinnat. Leaf. lanc. rounded blunt narrow. at base serrul. on outside at end, Stalk smooth nearly sq.
 14030 Very smooth, Leaflets of 16 pairs ovate oblique imbr. serr. at end, Stem round, Ament ovate nodding
 14031 Fronds pinnated, Leaf lanc. ac. pointless serrat. from middle to end chaffy ben. Stalk roundish spiny below
 14032 Fronds pinnated, Leaflets in 30-40 pairs falciform outwards with 3 or 4 prickly teeth at the end [smooth
 14033 Fronds pinnat. Leaf. frost. glauc. lanc. ac. point. with spiny teeth in midd. on outside, Stalk sq. and trunk
 14034 Leaflets oblique linear-lanceolate subulate hairy curved with 1 or 3 spines at the end and none on stalk
 14035 Leaflets linear entire obtuse of 20 pairs, Stem round unarmed scurfy at base [woolly
 14036 Leaf. oblique lanc. acute mucron. in midd. on outside with 2 spiny teeth smooth, Stalk sq. smooth, Trunk
 14037 Leaflets oblique lanceolate distichous acute pointless entire, Stalk smooth bluntly 4-cornered
 14038 Leaflets oblique linear somewhat sulcate 3-toothed at end smooth, Stalk $\frac{1}{2}$ round channelled

MONADELPHIA.

- 14039 Fronds plaited flabelliform, Leaflets spiny serrulate, Stalk unarmed
 14040 Fronds plaited flabelliform elongated in the middle, Leaflets smooth at edge, Stalk spiny
 14041 Spike divided, Catkins oblong somewhat squarrose, Scales cartilaginous acuminate, Culm simple

- 14042 Leaves mucronate pungent flower-bearing on their upper side and naked
 3 Leaves elliptical acute at each end, Branches weak
 14043 Leaves bearing flowers on their underside naked
 14044 Leaves bearing flowers on their upper side under a leaflet
 14045 Leaves bearing flowers at their edge
 14046 Raceme terminal hermaphrodite

- 14047 Leaves about 8 imbricated ovate-lanceolate mucronate perennial
 14048 Old leaves closely imbricated inflexed pointless

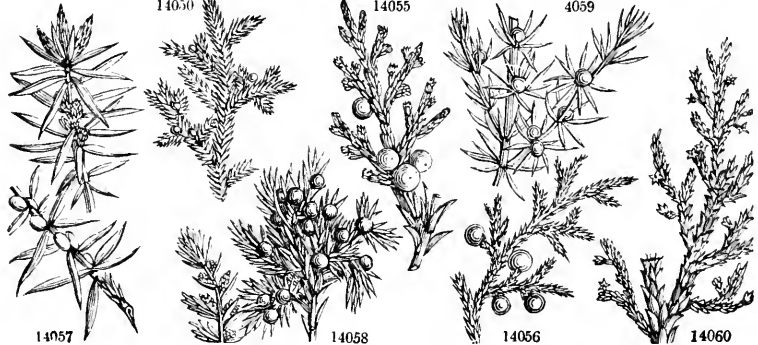

and Miscellaneous Particulars.

inferred as petals. Mr. Woodward remarks, that the flower does not properly grow out of the leaf, but on a pedicel from the bosom of the leaf, which is immersed beneath the outer coat, whence it may with ease be dissected. The female flowers are succeeded by red berries, almost as large as some cherries; they are sweet tasted, with two large orange-colored seeds in each. The green shoots were formerly used by butchers for sweeping their blocks, whence the common English name of the plant. It is still made into besoms in Italy. The tender growths, soon after they have sprung up from the root in spring, have been gathered and eaten by the poor like those of asparagus; and the branches, with the ripe fruit on them, were formerly stuck up in sand, with the stalks of Peony and Iris, displaying their capsules of ripe seeds; the three together made a sort of winter nosegay for rooms. In landscape gardening the plant is valuable as an evergreen, which will grow under the shade and drip of other trees. It harmonizes well with *Daphne Laureola*, and *Ulex nana*, and *Vaccinium vitis-idaea*. *R. hypophyllum* has the flowers on the under side of the leaves, which are succeeded by small red berries about the size of those of Juniper. *R. racemosus* is an elegant evergreen shrub, by some supposed to be the plant with which the ancients crowned their victors; but the more general opinion is in favor of *Laurus nobilis*. All the species are readily increased by suckers from the root.

212. *Araucaria*. The inhabitants of Chili call this noble ornament of their forests *araucanos*. *A. excelsa*, the Norfolk Island pine, is a most superb plant, growing to an enormous size, and never losing the bright imperishable foliage with which it is covered, as with a coat of mail. This genus, Sweet observes, "may be termed the handsomest genus of plants with which we are acquainted. *A. imbricata*, in particular, is certainly one of the grandest plants known. It will thrive well in the open air, with the protection of a mat or two in very severe weather, and when got pretty large, will, no doubt, be perfectly hardy. *A. excelsa*, or Norfolk Island pine, is also a beautiful tree, but will not do without the protection of a greenhouse. An equal mixture of sandy loam and peat will suit them very well; and cuttings may be rooted, though with difficulty, taken off at a joint in ripened wood, and planted in a pot of sand, which must be put under a hand-glass, in the propagating house, but not plunged in heat." (*Bot. Cult.* p. 135.)

History, Use, Propagation, Culture,

2113. *Juniperus*. From the Celtic *jenepirus*, which signifies rough, or rude. *Sandarach*, the name of a resin produced by the Juniper, is, according to Golus (p. 1225.), an alteration of the Arabic word *sandarouss*. The species, with only one or two exceptions, are close conical-growing evergreen shrubs or trees. The timber of *J. Barbadensis* and *Bermudiana* is imported from the West Indies under the name of Bermudas Cedar. *J. Virginiana* grows in the West Indies, the North American continent, and in Japan. It is one of the highest timber trees in Jamaica, affording very large boards of a reddish brown color, close and firm contecture, shining, very odoriferous, and bitter to the taste. It is imported into this and various other countries for the purposes of the cabinet-maker, as it is offensive to most insects. *J. communis* is common in all the northern parts of Europe, in fertile or barren soils, on hills or in vallies, in open sandy plains, or in moist and close woods. On the sides of hills its trunk grows long, but on the tops of rocky mountains and on bogs it is a tufted shrub. In England it is found chiefly on open downs in a chalky or sandy soil. In Scotland it is found in granite, trap and schistous hills and mountains; but not in the highest summits of the latter. In the south of Europe it is only found in elevated situations; it abounds in the Alps of Switzerland, but is not very common in the Apennines. In our shrubberies it forms a respectable looking conical bush, grouping and combining very well with cypresses, American cedars, and various species of the pine and fir tribe. It is easily transplanted, and bears cropping. Grass will not grow beneath it, but the *Avena Pratensis* is said to destroy it. The wood is hard and durable; the bark may be made into ropes; and ardent spirits, impregnated with the essential oil of these berries, forms the true Juniper water or gin. Various insects feed on this shrub; and it is eaten by horses, sheep, and goats, when they can get nothing better. A gum oozes spontaneously from the trunk of old plants, which is *Sandarach*, and in its powdered form is known under the name of pounce. Juniper berries require to remain two years on the tree before they are fully ripe. The greater quantity of those which are used in Britain, are brought from Germany, Holland, and Italy. They have a peculiar aromatic odor, and a sweetish, pungent, bitterish taste when chewed. In distillation with water, they yield a volatile terebinthinate oil of a greenish color, on which their virtues depend. The flavor and diuretic properties of hollands depend on this oil; it is also supposed to be used for flavoring English gin, but for this purpose oil of turpentine is used. Medicinally, Juniper berries are diuretic and cordial. They have been long known as a remedy in hydropic affections; but they cannot be depended on alone, although they form an excellent adjunct to foxglove and squill. The tops yield the same essential oil as the berries, and may therefore be substituted for them. (*Thom. Lond. Disp.*) *J. suecica* is by some considered only a variety. *J. sabina* seldom produces flowers or seeds in our gardens. Professor Pallas says, that in the Chersonesus Taurica, where it is very common, the savin is often found a foot and a half diameter; that it grows upright there, like a cypress, whereas by the Tanais it is procumbent the branches extending on the sand several fathoms; that the wood very much resembles that of *J. lycia*, but has a more cadaverous smell, and the leaves are more fetid. The leaves and tops of common savin have a strong, heavy, disagreeable flavor, and a bitter hot taste, with a considerable degree of acrimony. These qualities depend on an essential oil, which is obtained in considerable quantity by distillation with water. Both water and alcohol extract its active principles; and Lewis found that on inspissating the spirituous tincture, there remains an extract consisting of two distinct substances, of which one is yellow, unctuous or oily, bitterish, and very pungent; the other black, resinous, tenacious, less pungent, and subastrigent. Medicinally, savin is a powerful stimulant, possessing diaphoretic, emmenagogue, and anthelmintic properties. It has certainly, however, a considerable effect on the uterine system; but, on account of its stimulating properties, is suited to those cases only of amenorrhœa which are unattended by fever, and in which the circulation is

- 14049 Leaves imbricated in 4 rows acute
 14050 Lower leaves ternate : upper binate decurrent subulate spreading acute
 14051 Leaves decurrent imbricated spreading closely packed, of the stem in threes of the branches in fours
 14052 Leaves opposite bluish glandular in the middle imbricated in 4 ways, Stem arboresous
 14053 Lvs. opp. blunt glanular in the middle imbricated in 4 ways : the younger acute and opp. Stem shrubby
 14054 Leaves opp. acute imbricated in about 4 rows smooth glaucous, Branches horizontal prostrate
 14055 Leaves opposite acute imbricated decurrent : occasionally spreading and subulate
 14056 Leaves in 3s adnate at base : younger imbricated ; old ones spreading
 14057 Leaves ternate spreading mucronate longer than the berry
 14058 Leaves ternate falcate somewhat imbricated the length of berries
 14059 Leaves ternate spreading pointed shorter than berry
 14060 Leaves ternate obliterated imbricated blunt
 14061 Leaves ternate imbricated all ways ovate blunt
 14062 Leaves all imbricated in 4 rows : younger ovate ; old ones acute
 14063 Leaves thickly set linear distichous flat, Male receptacles globose
 14064 Sheaths of joints 2-toothed blunt, Catkins 2-3 opposite stalked, Peduncles shorter than catkins
 14065 Sheaths of joints 2-toothed blunt, Catkins solitary scattered or opposite, Peduncles longer than catkin
 14066 Sheaths of joints bifid acum. Male catkins clustered sessile or stalked, Fem. solit. stalk. Branches spreading

- 14067 Leaves peltate subcordate ovate-orbicular silky beneath, Female racemes longer than leaves

and Miscellaneous Particulas.

languid. In plethoric habits, its use should be preceded by repeated bleedings; and at all times its internal exhibition requires caution. It has been given in gout and worm cases also, but is seldom used. As an external local stimulant or escharotic, the dried leaves in powder are applied to warts, flabby ulcers, and carious bones; and the expressed juice diluted, or an infusion of the leaves, as a lotion to gangrenous sores, scabies, and tinea capitis, or mixed with lard and wax as an issue ointment. (*Thom. Lond. Disp.* p. 342.)

J. Lycia, which greatly resembles the savin, is commonly thought to produce the gum resin called Olibanum; though Dr. Thomson and others consider the *Boswellia Serrata* of Roxburgh as the true plant. Olibanum is supposed to have been the incense used by the ancients in their religious ceremonies; it is much employed by the Roman Catholics in their churches, and generally as a perfume in sick rooms.

2114. *Taxus*. According to Vossius this word is derived from *τεξος*, an arrow, because that weapon was formerly poisoned with the juice of the plant. Yew seems to be an alteration of the Celtic *iu*, green. *T. baccata* inhabits mountainous woods in Europe, North America, and Japan. Caesar mentions it as very common in Gaul and Germany. In Britain and Ireland there was formerly great abundance in a wild state, and planted in church-yards. Ray says that our ancestors planted the yew in church-yards because it was an evergreen tree, as a symbol of that immortality which they hoped and expected for the persons there deposited. Hence a custom, which still exists in a few places of Wales and Ireland, of carrying twigs of this and other evergreen trees in funerals, and throwing them into the grave with the corpse. According to some, the yew was planted in church-yards on account of its utility in making bows; but this is by no means likely, when the tree was so common in a wild state, and when a single one would have afforded so very scanty a supply. The bow was considered an engine of military warfare, at least up to the time of Henry VIII.; so great was the demand for yew in the days of archery, that our own stock could not supply the demand; it was obliged to be imported, and various laws were passed concerning it from the time of Edward IV. to Elizabeth. The wood of the yew is red and veined, very hard and smooth, used by turners, cabinet-makers, millwrights, and a variety of other artisans. Flood-gates for ponds made of it, are said to be of incredible duration. The twigs and leaves of yew, eaten in a very small quantity, are certain death to horses and cows; but deer, it is said, will crop these trees with impunity, and sheep and goats are said by Linnæus to eat them. Turkeys, peacocks, and other poultry and birds eat both the leaves and fruit. A few of the berries are not deleterious to the human species, but the leaves are fatal. The tree is very patient of the shears, and was much employed in the ancient style of gardening for verdant architecture and sculpture. Allowed to take its natural shape, and when advanced to a considerable age, it forms one of the handsomest of British evergreens, harmonizing admirably with the holly, the box, and the juniper. The yew is generally propagated from seeds, which are either sown as soon as they are ripe, without clearing them from the pulp, or mixed with sand, and laid in a heap to be turned over two or three times during the winter, and in spring, the seeds from which the pulp will have rotted sown in beds of light loamy soil. By either mode, a part of the plants will come up the first season, and the remainder in that following. The Irish yew is probably a distinct species.

2115. *Ephedra*. This was a name given by the Greeks to our *Equisetum*, which the plant now called *Ephedra* strongly resembles. *E. Distachya* abounds in the southern parts of Russia, and from thence southwards to Persia and India. The berries ripen in July and August: they are sweetish, mucous, and leave a little heat in the throat. They are eaten by the Russian peasants, and by the wandering hordes of all Great Tartary.

2116. *Cissampelos*. From *κισσος*, the Greek name of the ivy, and *αμπίλος*, vine; a plant partaking of the

History, Use, Propagation, Culture,

nature of the former in its foliage, and of the latter in its fruit. The roots of several species are said to have powerful medicinal qualities. That of the *C. pareira*, or *Parceira brava*, is bitter, diuretic, and aperient; of *C. caapeba* more mucilaginous.

2117. *Excæcaria*. From *excæcare*, to blind. The juice of this plant is so acrid as to cause loss of sight whenever it touches the eyes. Agallochum, the produce of one of the species, was the name given by the Greeks to an aromatic wood they obtained from India. In Arabia it is called, according to Gólius *aghátoudjy*.

2118. *Adelia*. From α , privative, and $\delta\eta\lambda\omicron\varsigma$, visible. The parts of fructification are so minute as to be hardly visible. *A. Bernardia* derives its name from having been considered a distinct genus, and dedicated to the celebrated Bernard de Jussieu. *Bernardia* is the name which ought to have been adopted for the genus. Ugly uninteresting shrubs.

2119. *Loureira*. Dedicated by Cavanilles to John de Loureiro, a Portuguese missionary, who travelled in China and Cochín-china, of which he published the Flora in 1790.

2120. *Myristica*. From *mygga*, myrrh, on account of the odor of the fruit. *M. moschata* produces spheroidal drupes, fleshy, smooth, and finally drying up into a coriaceous crust, and opening on one side. Each berry contains an ovate, globular, serrated nut. The arillus or cover, which is commonly called mace, is fleshy, coriaceous, and reddish-saffron colored. Under this are two shells, the outer thin and brittle, and reticulated by the impressions of the mace; the inner shell is membranaceous, and adheres very closely to the kernel. The fruit would be a drupe was it not for the arillus.

The nutmeg-tree yields three crops annually; the first in April, which is the best; the second in August, and the third in December; yet the fruit requires nine months to ripen it. When it is gathered, the outer coriaceous covering is first stripped off, and then the mace carefully separated and dried in the sun. The nutmegs in the shell are next exposed to heat and smoke for three months, then broken, and the kernels thrown into a strong mixture of lime and water; after which they are cleaned and packed up. This process is necessary for their preservation, and with the same intention the mace is sprinkled with salt water. There are several varieties of the tree; but that denominated the queen nutmeg, which bears a small round nut, is the best. They are imported in chests, which contain each from 100 to 140 lbs. weight; the mace comes in chests also of different sizes. The essential oil which is obtained in Banda by the distillation of the nut is brought

14068 Leaves somewhat orbicular cordate at base 7-nerved or little downy, Fem. racemes the length of leaves
 14069 Lvs. ovate bluntish smooth on short stalks, Racemes much branched, male? scarcely longer than petiole

14070 Monœcious diandrous, Leaves oblong serrated

14071 Leaves oblong downy serrated

14083 Leaves elliptical blunt densely downy on each side, Flowers axillary solitary sessile

14084 Leaves stalked ovate acute smooth, Flowers in 5s axillary

14085 Leaves stalked elliptical blunt somewhat retuse smooth shining, Flowers axillary polygamous about 3

and Miscellaneous Particulars.

in bottles, and the expressed oil in stone jars. Nutmegs are frequently punctured and boiled in order to obtain the essential oil, and the orifices afterwards closed with powdered saffron. The fraud is detected by the lightness of the nutmeg. The nutmeg has a fragrant, agreeable, spicy odor, and a warm aromatic taste.

As the medical properties of nutmeg and mace depend on the essential oil they contain, they agree in these circumstances; and both are stimulant, carminative, and, in large doses, narcotic. Mace is more generally used as a culinary spice; but the nutmeg and its volatile oil are in frequent use to cover the disagreeable taste of other medicines, and are sometimes ordered in cases of languor, vomiting, and diarrhoea, and in flatulent colic. On account of the narcotic property of the oil, nutmeg should be cautiously employed in apoplectic and paralytic habits. In India its dangerous effects have been frequently felt; and in this country instances have occurred in which the nutmeg, taken in large quantity, produced drowsiness, great stupor, and insensibility, and on awakening delirium, which alternated with sleep for several hours. (*Thom. Lond. Disp. p. 395.*)

M. fatua is a branching lofty tree; the branches long, tortuous and declining; the leafy and flowering branches downy and ferruginous; and the flowers in axillary and terminal clusters. The fruit varies in size and form on different trees; but is generally oblong, and about as long as a pigeon's egg. From the kernel is extracted a species of yellowish suet or fat, which serves for various medical and economical purposes, and is made into candles. From the wounded bark flows a red acrid juice. The plants are at present rare in British collections: they grow in light loam and peat, and may be increased by cuttings in sand under a bell-glass.

2121. *Nepenthes*. The name under which Homer speaks of a substance, which appears to have been opium. It is impossible to conceive in what sense the word has been applied to the plants now bearing the name. They are the famous pitcher-plants of China and the East Indies, which bear leaves, the extremities of which are hollowed out into cup-like appendages, which are generally filled with water, which seems as if confined within them by a little lid, by which the pitchers are surmounted. The cultivation of the plants is extremely difficult. It requires a very damp atmosphere, much heat, and perhaps, not much light. They are managed more successfully by Loddiges of Hackney, than by any cultivators in this country.

2122. *Cuytia*. Named by Boerhaave, after Outgers Cluyt, or Augier Clutus, a Dutchman, and professor of botany at Leyden. He published, in 1634, a little tract upon the Cocoa-nut of the Maldives, which he called *nux-medica*. The species are of little beauty or interest, and of the easiest propagation and culture.

CLASS XXIII. — POLYGAMIA.

Flowers either male, female, or hermaphrodite, upon the same or different plants.

This class differs from the two preceding in having not only the sexes in different flowers upon the same individual as in Monœcia, or upon separate individuals as in Diœcia, but also combined in one flower, mixed among those which are unisexual. It may, therefore, be considered to contain those genera which are in a state of transition from the common hermaphrodite structure to absolute unisexuality.

To the first of its orders are referred several grasses, which are excluded from the early classes on account of the separation of their sexes; it also contains the numerous tribe of Mimosas, so well known for their various properties as objects of food, of ornament, of medicine, or of curiosity. The maple is also stationed in the first class, as are a few genera of palms.

The most important genera of the second class, besides the poetical Palmetto, are the ash and the fig. Gleditschia and Ceratonia, two families of Leguminosæ, are valuable, the former for its light, airy, elegant foliage, and the latter for its sweet pods, which are used in Spain, in great quantities, as fodder for cattle.

Order 1. MONŒCIA.

Flowers monœcious.

2123. *Inga*. Hermaphrodite. Cal. 5-toothed. Cor. tubular, 5-fid. Stam. 100, monadelphous. Pod 2-valved. Seeds enveloped in pulp, or in an arillus. Male. Cal. 5-toothed. Cor. tubular, 5-fid. Stam. 100, monadelphous.
2124. *Mimosa*. Hermaphrodite. Cal. 5-toothed. Cor. O. or 5-toothed. Stam. 8. Pod separating into one-seeded joints. Male. Cal. 5-toothed. Cor. O. or 5-toothed. Stamens 8.
2125. *Schrankia*. Hermaphrodite. Cal. 5-toothed. Cor. 5-fid. Stamens 8-10. Pod 4-valved. Male. Cal. 5-toothed. Cor. 5-fid. Stamens 8-10.
2126. *Desmanthus*. Hermaphrodite. Cal. 5-toothed. Cor. 5 petals. Stamens 20. Pod 2-valved. Male. Cal. 5-toothed. Cor. O. Stamens 20.
2127. *Acacia*. Hermaphrodite. Cal. 5-toothed. Cor. 5-fid. Stamens 4-100. Pod 2-valved. Male. Cal. 5-toothed. Cor. 5-fid. Stamens 4-100.
2128. *Veratrum*. Hermaphrodite. Cal. O. Cor. 6-petalous. Stamens 6. Ovaries 3. Caps. 3, many-seeded. Male. Same as hermaphrodite, but no ovary.
2129. *Andropogon*. Hermaphrodite. Cal. 1-fl. Paleæ glume bearded, either at base or tip. Stamens 3. Styles 2. Seed 1. Male. Ovary none.
2130. *Chloris*. Flowers 1-sided. Cal. 2-valved, with 2 or 6 florets: one sessile, hermaphrodite; the other stalked, male. Hermaphrodite. Paleæ with a terminal beard. Stamens 3. Styles 2. Seed 1. Male. Cal. O. Paleæ one or two, bearded. Stamens 3.
2131. *Sorghum*. Flowers panicle. Glume coriaceous-cartilaginous, 2-flowered closed. Paleæ of the hermaphrodite bearded; of the neuter single, beardless. Male. Glume 1-fl. stalked. Paleæ 2, beardless.
2132. *Holcus*. Hermaphrodite. Cal. glume 1-2-flowered. Paleæ bearded under the end. Stamens 3. Styles 2. Seed 1. Male. Cal. glume 2-valved. Paleæ O. or 2. Stamens 3.
2133. *Ischaemum*. Hermaphrodite. Cal. glume 2-flowered. Paleæ 2. Stamens 3. Styles 2. Seed 1. Male. Cal. and palea as in hermaphrodite. Stamens 3.
2134. *Egilops*. Hermaphrodite. Cal. glume about 3-flowered, cartilaginous. Palea terminated by a triple beard. Stamens 3. Styles 2. Seed 1. Male. Cal. and pal. of hermaphrodite. Stamens 3.
2135. *Manisuris*. Hermaphrodite. Glume 1-fl. Paleæ 2. Stamens 3. Style bifid. Male. Glume 1-fl. Paleæ 2. Stam. 3. All the valves of calyx emarginate at end and sides.
2136. *Valantia*. Hermaphrodite. Cal. O. Cor. 4-parted. Stamens 4. Style 2-fid. Seed 1. Male. Cal. O. Cor. 3-4-parted. Styles 3-4.
2137. *Parietaria*. Hermaphrodite. Cal. 4-fid. Cor. O. Stam. 4. Style 1. Seed 1. Female. Cal. 4-fid. Cor. O. Style 1. Seed 1.
2138. *Atriplex*. Perfect fl. Perianth, single, 5-partite, inferior. Stam. 5. Style bipartite. Fruit depressed, 1-seeded, covered by the cal. Pistilliferous fl. Perianth, single, 2-partite. Stam. O. The rest as in the perfect flower.
2139. *Rhagodia*. Hermaphrodite. Cal. 5-parted. Cor. O. Stamens 5, or fewer. Acinus depressed. Male. Cal., cor., and stam. of the hermaphrodite.
2140. *Terminalia*. Hermaphrodite. Cal. 5-parted. Cor. O. Stam. 10. Drupe inferior. Male. Cal. five-parted. Cor. O. Stamens 10.
2141. *Fusanus*. Hermaphrodite. Cal. 5-fid. Cor. O. Stamens 4. Ovary inferior. Stigma 4. A drupe. Male. Fruit abortive. Cal., cor., and stam. of hermaphrodite.
2142. *Bracjum*. Hermaphrodite. Cor. of catkin 4-parted. Stamens 4. Style 2-fid. Drupe with a fleshy round nut. Male. Cor. of catkin 4-parted. Stamens 4. Style 2-fid. abortive.
2143. *Acer*. Hermaphrodite. Cal. 5-fid. Cor. 5 petals. Stamens 8. Styles 2. Samara winged at end, one-seeded. Male. Cal. 5-fid. Cor. 5 petals. Stamens 8.
2144. *Negundium*. Cal. very small, unqually 4-7-toothed. Pet. O. Male. Flowers fascicled. Anthers 4-5, linear, sessile. Female. Flowers racemose.
2145. *Celtis*. Hermaphrodite. Cal. 5-parted. Cor. O. Stamens 5. Styles 2. A drupe. Male. Cal. six-parted. Cor. O. Stamens 6.
2146. *Gouania*. Hermaphrodite. Cal. 5-fid. superior. Cor. O. Stamens 5. Style 3-fid. Fruit 3-cornered, 3-parted. Male. Cal. 5-fid. Cor. O. Stamens 5.
2147. *Hermas*. Hermaphrodite. An umbel. Cor. 5 petals. Stamens 5, sterile. Male. An umbel. Cor. 5 petals. Stamens 5, fertile. Styles 2. Seeds 2, inferior, cordate, orbicular.
2148. *Bridelia*. Hermaphrodite. Cal. 5-parted. Petals 5, inserted in calyx. Stamens 5, monadelphous. Styles 2, bifid. Berry 2-seeded. Male. Cal. 5-parted. Petals 5, inserted in the calyx. Filam. columnar, bearing 5 anthers. Female. Cal. and corolla of male. Styles 2, bifid. Berry 2-seeded.
2149. *Feronia*. Hermaphrodite. Cal. 5-toothed. Cor. 5 petals. Stamens 10. Style 1. Berry 5-celled, many-seeded. Male. Cal. 5-toothed. Cor. 5 petals. Stamens 10.
2150. *Ailantus*. Hermaphrodite. Cal. 5-parted. Cor. 5 petals. Stamens 2-3. Ovaria 3-5. Styles lateral. Samaras 1-seeded. Male. Cal. 5-parted. Cor. 5 petals. Stamens 10. Female. Cal. 5-parted. Cor. 5 petals. Ovaries 3-5. Styles lateral. Samaras 1-seeded.
2151. *Clusia*. Hermaphrodite. Cal. 6-leaved. Cor. 4-6 petals. Anthers clustered. Stigmas 4-6. Caps. 6-celled, many-seeded. Male. Cal. 4-6-leaved. Cor. 6 petals. Stamens numerous.
2152. *Ophioxylon*. Hermaphrodite. Cal. 5-fid. Cor. 5-fid. Stamens 3. Ovary 1. Male. Cal. 2-fid. Cor. 5-fid. Stamens 2.

2153. *Rhapis*. Hermaphrodite. Cal. 3-fid. Cor. 3-fid. Stamens 6. Ovary 1. Drupe 1-seeded. Male. Cal. 3-fid. Cor. 3-fid. Stamens 6.

Order 2. DICECIA.

Flowers dioecious.

2154. *Gleditschia*. Hermaphrodite. Cal. 4-fid. Cor. 4 petals. Stamens 6. A pod. Male. Cal. 3-leaved. Petals 3. Stamens 6. Female. Cal. 5-leaved. Petals 5. A pod.
2155. *Ceratonia*. Hermaphrodite. Cal. 5-parted. Cor. O. Stamens 5. Style 1. Pod coriaceous, many-seeded. Male. Cal. 5-parted. Cor. O. Stamens 5. Female. Cal. about 5-toothed. Cor. O. Style 1. Pod coriaceous, many-seeded.
2156. *Fraxinus*. Hermaphrodite. Cal. O. or 4-parted. Cor. O. or 4 petals. Stamens 2. Samara 1-seeded. Female. Cal. O. or 4-parted. Cor. O. or 4 petals. Samara 1-seeded.
2157. *Brosimum*. Hermaphrodite. Catkin globose, with a solitary ovary at end. Cal. a scale. Cor. O. Anthers peltate, solitary. Style 2-fid. Female. Cal. O. Cor. O. Ovary imbricated with scales. Style 2-fid. Berry coated, 1-seeded.
2158. *Diospyrus*. Hermaphrodite. Cal. and cor. 4-fid. Stam. 8. Style 4-fid. Berry 8-seeded. Male. Cal. and cor. 4-fid. Stamens 8.
2159. *Myrsine*. Cor. half 5-cleft, conniving. Ovary filling the corolla. Drupe 1-seeded. Nut 5-celled.
2160. *Nyssa*. Hermaphrodite. Cal. 5-parted. Cor. O. Stamens 5. Ovary 1. Drupe inferior. Male. Cal. 5-parted. Cor. O. Stam. 10.
2161. *Hamiltonia*. Hermaphrodite. Cal. 5-fid. Cor. O. Nect. a 5-toothed disk. Stamens 5. Ovary 1. Drupe inferior. Male. Cal. 5-fid. Cor. O. Nect. a 5-toothed disk. Stamens 5.
2162. *Laurophyllus*. Hermaphrodite. Cal. 4-leaved. Cor. O. Stamens 4. Ovary superior. Style 1. Male. Cal. 4-leaved. Cor. O. Stamens 4.
2163. *Bursera*. Hermaphrodite. Cal. 5-toothed. Petals 5. Stamens 10. Style O. Caps. 3-valved, one-seeded. Male. Cal. 5-toothed. Petals 5. Stamens 10.

History, Use, Propagation, Culture,

2123. *Inga*. This is an American name adopted by Marcgraaf. A fine genus of plants, remarkable for their beautiful foliage and flowers; but in cultivation they seldom blossom. *I. purpurea* is a remarkably elegant plant, and so is *Inga biglobosa*. *I. unguis-Cati*, the Cat's claw, *Mimosa*, is so called from the form of its curved spines. All the species require the greatest heat of the bark stove; they increase very slowly by cuttings.

2124. *Mimosa*. Said to be derived from *mimus*, a buffoon, because the leaves of the sensitive species appear as if to play with the hand that touches them.

The cause of the well known motion in the leaves of the sensitive plant, has been the subject of many ingenious explanations; but it has not been treated by any botanist with so much ingenuity and address as by Dr. Dutrochet, whose theory we give, as explained by Mr. Lindley in the Botanical Register. M. Dutrochet states, that having ascertained hot nitric acid to possess the power of separating and reducing to its simplest form the whole mass of vegetable tissue, and that the action of the same acid produced other effects equally advantageous for the examination of the most obscure parts of vegetable structure, he was induced to give his attention to that of the *Mimosa pudica*, in the hope of gaining some evidence respecting the cause to which its sensibility is to be ascribed. Beginning with the pith, he observed a considerable number of minute globules of a greenish color, intermingled among the cells, and adhering to them in an irregular manner. After attempting to shew the probability of these globules having deceived M. Mirbel in various points of his analysis of vegetation, and especially in regard to the pores, which that botanist supposes to exist in the cellular tissue of plants, Dr. Dutrochet proceeds to remark, that the application of hot nitric acid to these globules renders them perfectly opaque, whence he concludes, that they are, in fact, minute cells filled with a particular fluid, which is subject to become concrete by the application of acids. Now, it is known, that such fluids as are thus altered by acids, are usually dissolved and liquefied again by the application of alkalis. A few drops, therefore, of a solution of hydrate of potash were suffered to fall upon a portion of the pith on which nitric acid had been acting, and the mixture was exposed to the heat of a lamp. Being examined after a few minutes, the globules were found to have resumed their natural appearance. This curious fact indicated, in the opinion of Dr. Dutrochet, a strong and unexpected point of analogy between plants and animals. According to the microscopical researches of some modern observers, it has been ascertained that all the organs of animals are composed of a conglomeration of minute corpuscles, similar to those just described; the corpuscles which constitute the muscles are soluble in acids, but those which compose the nervous system are insoluble in the same acids, and only soluble in alkalis. Now, as the chemical properties and the external appearance of the particles scattered among the cellular tissue of plants, and constituting the nervous system of animals, are the same, the author is induced to infer, that the spherical particles of plants are, in fact, the

MONŒCIA.

14086 Spines stipulary very short straight, Leaves of two pairs halved oblong obt. Panicle simple long terminal
 14087 Spines stipulary straight, Leaves of two pairs roundish elliptical halved emarginate, Raceme terminal
 14088 Unarmed, Leaves bipinnate, Spike double of two globes pendulous
 14089 Unarm. Lvs. bipin. of 2 pairs, Leaf. ov. ac. smooth shining above, Glands between every pair, Petiole winged
 14090 Unarm. Lvs. pinn. of about 5 pairs, Leaf. ov. obl. acum. smooth, Gland between every pair, Petiole winged
 14091 Leaf. of 5 pairs obl. acum. hairy above and shining villous beneath, Branches covered with rusty down
 14092 Unarmed, Lvs. of 3 pairs, Leaflets obl. acuminate equal smooth, Gland between each pair, Petiole winged
 14093 Unarm. Lvs. pinn. of 2 pairs, Leaf. obl. lanc. acum. smooth, Gland between each pair, Petiole wing. at end
 14094 Spines stipulary recurved, Leaves of 2 pairs, Leaflets halved obovate, Pod ensiform straight
 14095 Unarm. Lvs. pinn. of 2 pairs, Leaf. obov. obl. unequal sided smooth, A gland between the lowest small ones
 14096 Unarmed, Lvs. conjugate pinnate, Leaflets ov. obl. term. opp. lateral alternate, Flowers in lateral umbels
 14097 Unarmed, Lvs. conjugate pinnate, Leaf. obl. blunt uneq. at base, Petioles without glands, Heads stalked
 14098 Spines stipular, Lvs. conjugate pinnate, Pinnæ of 3 pairs, Leaflets ovate acute smooth, Pods spirally twisted

14099 Unarmed herbaceous, Leaves conjugate pinnate, Pinnæ 4 pairs, Leaflets roundish, Pods with one joint
 14100 Prickles of branches and stems scattered hooked, Lvs. bipinn. ciliat. and rough, Sutures of pods very spiny
 14101 Stem and petioles prickly, Leaflets nearly halved ovate acute hairy beneath smooth above
 14102 Spines of petiol. scatter. very broad compr. straight, Lvs. bipinn. finally smooth without glands, Leaf. 10-15
 14103 Stem and petioles prickly, Leaflets halved cordate ovate blunt smooth
 14104 Stem prickly more or less hispid, Leaves digitate-pinnate, Pinnæ 4 of many pairs, Leaflets linear
 14105 Stem aculeate smooth hairy upwards, Leaves digitate-pinnate, Pinnæ 8 of many pairs, Leaflets linear
 14106 Like *M. asperata*, but less hairy
 14107 Prickles of branches and stems scattered hooked, Leaves bipinnate, Pinnæ of 5 pairs, Leaflets 20-25 lin.
 14108 Leaves bipinnate, Pinnæ of 8-12 pairs, Leaflets of many pairs bristly ben. Peduncles twin as long as head
 14109 Prickly, Leaves bipinnate: partial of 6 pairs; proper of many pairs cultrate, Gland of petiole depressed
 14110 Lvs. bipinnate terminated by a tendril, Pinnæ of 2-3 pairs, Leaflets oval emarg. Spikes numerous fasciated

14111 Prickly, Leaves bipinnate: partial of 3 pairs; proper of many pairs, Pods acute, Stem 4-cornered
 14112 Prickly, Leaves bipinnate: partial of 6 pairs; proper of many pairs, Pods acute, Stem 5-cornered

and Miscellaneous Particulars.

scattered elements of their nervous system. This hypothesis receives additional strength from the great similarity which exists between the medullary substance of the brain of Mollusca Gasteropoda and the cellular medullary tissue of plants. In pursuit of this idea, Dr. Dutrochet made a variety of experiments upon the sensitive plant, the results of which seem to be these. — The principal point of locomotion, or of mobility, exists in the little swelling which is situated at the base of the common and partial petioles of the leaves; this swelling is composed of a very delicate cellular tissue, in which is found an immense number of nervous corpuscles; the axis of the swelling is formed of a little fascicle of tubular vessels. It was ascertained by some delicate experiments, that the power of movement, or of contraction and expansion, exists in the parenchyma and cellular tissue of the swelling, and that the central fibres have no specific action connected with the motion. It also appeared that the energy of the nervous powers of the leaf depended wholly upon an abundance of sap, and that a diminution of that fluid occasioned an extreme diminution of the sensibility of the leaves. Prosecuting his remarks yet further, the author ascertained, that in the motion of the sensitive plant, two distinct actions take place, the one of locomotion, which is the consequence of direct violence offered to the leaves, and which occurs in the swellings already spoken of; the other of nervimotion, which depends upon some stimulus applied to the surface of the leaflets, unaccompanied by actual violence, such as the solar rays concentrated in the focus of a lens. As in all cases, the bending or folding of the leaves evidently takes place from one leaf to another with perfect continuity; it may safely be inferred, that the invisible nervous action takes place in a direct line from the point of original irritation, and that the cause by which this action of nervimotion is produced, must be some internal uninterrupted agency. This was, after much curious investigation, determined by the author to exist neither in the pith, nor in the bark, nor even in the cellular tissue filled with nervous corpuscles, and on which, he supposes, the locomotion of the swelling at the base of petioles to depend. It is in the ligamentous part of the central system, in certain tubes supplied with nervous corpuscles, and serving for the transmission of the sap, that Dr. Dutrochet believes he has found the true seat of nervimotion, which he attributes to the agency of the sap alone, while he considers the power of locomotion to depend upon the nervous corpuscles alone.

Some of the species ripen seed; others may be increased by cuttings from the points of the young shoots planted in sand and kept closely covered.

The pods of *M. fagittolia* contain a sweet whitish pulp, which the natives of Martinique suck; they call the tree and its fruit *Pois Doux*, or sweet pea.

2125. *Schrankia*. Named by Willdenow, in honor of his countryman, Francis de Paula Schrank, a well known German botanist. Herbaceous prickly shabby-looking plants, with the habit of *Mimosa*.

History, Use, Propagation, Culture,

3126. *Desmanthus*. From *desmus*, a bond, and *avros*, a flower, on account of the fascicles of flowers, which seem as if bound up together. These plants are chiefly aquatic; a few are prickly; and they all have the habit of *Mimosa*. *D. natans* is used in China as a pot-herb; and is described by Loureiro, under the name of *Neptunia oleracea*. Willdenow, the author of the genus, observes, that the neuter florets have always a different color from that of the hermaphrodites, whence the spikes appear parti-colored, by which character the genus may be known at a distance. Culture as in *Mimosa*. *D. natans* should be grown in water.

2127. *Acacia*. This was the Greek name of some plant of the present genus, and not being appropriated, was taken by Willdenow, in his reformation of the old genus *Mimosa*, as the designation of one of his new divisions. This is one of the most ornamental families of the greenhouse plants, and some are curious as well as beautiful. *A. Julibrissin*, the *Gul chruschun*, or rose of silk of the Persians, and the *Gazia* of Italian gardeners, is an elegant hardy tree with beautiful tufts of pink colored flowers, which resemble tassels of silken threads.

A. Catechu and *vera* are used in medicine. The inner wood of the former tree is of a brown color, from which the catechu is thus prepared. "After felling the trees, the manufacturer carefully cuts off all the exterior white part of the wood. The interior colored part is cut into chips, with which he fills a narrow-mouthed unglazed earthen pot, pouring water upon them until he sees it among the upper chips; and when

- 14113 Unarmed, Leaves bipinnate : partial of 3 pairs ; proper of many pairs, Spikes ovate, Pedunc. with bractes
 14114 Unarmed, Leaves bipinnate : partial of 3 or 4 pairs ; proper of 12 pairs, Spikes ovate, Stem prost. compres.
 14115 Unarmed, Lvs. bipinnate : partial of 4 or 5 pairs ; proper of 12 pairs. Spikes few-fl. capit. pentand. Pods lin.
 14116 Unarmed, Lvs. bipinnate : partial of 4 pairs ; proper of 12 pairs, Spikes few-fl. capitata decand. Pods linear
 14117 Unarmed, Leaves bipinnate ; partial of 4 or 5 pairs ; proper of many pairs, Spikes ovate, Pods obl. blunt
 14118 Spines solit. Lvs. bipinn. : partial of about 9 pairs ; proper of many pairs, Spikes cylind. atten. at base cernu.
 14119 Spines solitary, Leaves bipinn. : partial of 8 pairs ; proper of many pairs, Spikes cylindrical twin pendulous

1. Leafless.

- 14120 Unarmed, Petioles linear subulate mucronate rigid pungent whorled, Spikes cylindrical solitary
 14121 Unarmed, Petioles linear subulate mucronate rigid pungent alternate clustered, Spikes globose solitary
 14122 Petioles round subulate mucronate scattered rigid, Stipules deciduous, Spikes globose solitary
 14123 Stipules spiny very minute, Petioles linear subulate-pungent close together, Peduncles solitary
 14124 Petioles filiform furrowed on each side : point harmless, Heads twin, Pods wavy
 14125 Unarmed, Petioles linear narrowed at base mucron. Spikes globose stalked racemose, Branches 3-cornered
 14126 Unarmed, Petioles lanceolate subfalcate narrowed at base blunt about 2-nerved glaucous, Spikes axillary
 14127 Unarm. Petioles lin. narrowed at each end mucron. arcuate striat. Fls. interruptedly spok. Branches round.
 14128 Unarm. Petiol. lin. narrow. at base straight mucron. Spikes glob. stalk. racem. Racemes nearly as long as lvs.
 14129 Petioles narrow lin. very long 1-nerved erect entire, Spikes several axillary generally branched
 14130 Stip. scarcely any, Petioles tiliform compressed cernuous spreading with an incurved point, Pods turulose
 14131 Unarmed, Petioles linear lanceolate narrowed at base obtuse, Spikes globose axillary stalked double
 14132 Unarmed, Petioles lin. lanc. narrowed at each end 3-nerved striated, Spikes axillary double cylindrical
 14133 Unarmed, Petioles oblong falcate narrowed at base acute veiny, Branches 2-edged
 14134 Unarmed, Petioles ovato-acute many-nerved, Spikes globose stalked, Pods falcate
 14135 Stip. very small decidu. Petiol. lin. 1-nerved with an oblique point, Branches procumb. diff. smooth angul.

- 14136 Petioles very long filiform 1-nerved spreading, Spikes several axillary generally branched
 14137 Petioles half oblong wavy : their inner edge a little truncate, Stipules spiny, Branches smooth
 14138 Petioles lanceolate oblong nerved somewhat falcate, Heads racemose, Young shoots furred
 14139 Petioles oblong equal-sided nerved, Spikes twin sessile, Corollas 4-petals, Pods torose
 14140 Petioles long lanc. somewhat falcate edged 1-nerved : the anterior edge with 1 gland, Heads racemose 4-fl.
 14141 Unarmed, Petioles oblong acuminate veiny, Spikes globose stalked racemose
 14142 Petioles half obl. somew. falcate tapered at base with a little gland on the convex side, Branches smooth
 14143 Petioles linear tapered at base acute mucronate 1-nerved entire, Heads racemose many-flowered
 14144 Unarmed, Petioles sessile oblong cuspidate toothletted scabrous, Spikes globose solitary axillary
 14145 Petioles triangular : outer angle spiny ; inner bearing glands, Stip. setaceous caducous, Branchlets smooth
 14146 Petiol. triangular : outer angle spiny ; inner bearing glands, Stip. setaceous spiny persist. Branchlets downy
 14147 Petiol. halv. obl. smooth mucronul. 1-nerv. : never parallel with inner edge, Stip. veiny, Branches hirsute
 14148 Stem winged two ways, Petioles decurrent 1-nerved terminated by a spine, Stipules spiny
 14149 Petioles half elliptical lanceolate mucronate aristate 1-nerved in middle and branches hispid

2. Leafy.

* Unarmed.

- 14150 Leaves conjugate pinnate terminated by a tendril, Pinnae of 4 pairs, Spikes filif. Petals 5, Stem climbing
 14151 Unarmed, Leaves bipinnate : partial of 2 pair ; proper of 2 pair vill. Petiole without glands, Head globose
 14152 Unarmed hairy, Lvs. bipinnate : partial of 2 pair ; proper of 2 or 3 pair, Stip. somew. setaceous deciduous
 14153 Unarmed smooth, Leaves bipinnate : partial of 2 pair ; proper of 2 to 7 pair, Stip. subulate setaceous
 14154 Lvs. bipinnate : partial and proper of 10 pairs ellipt. blunt, Gland of petiole convex, Spikes filif. solit. axill.
 14155 Leaves bipinnate : partial of about 6 pairs ; proper of many, Petioles downy, Spike terminal interrupted
 14156 Leaves bipinnate : partial of 4 pairs ; proper of 10-12, lowest very minute, Spikes globose term. panicled
 14157 Unarmed, Leaves bipinnated, Pinnae of 3 or 5 pair, Leaflets of 15 or 20 pair falcate acute smoothish
 14158 Lvs. bipinn. : partial of 7 pair ; proper of 17 pair halv. acute, Spikes glob. stalk. axill. Pods arcuate twisted
 14159 Lvs. bipinn. : partial of 11 pair ; proper of many pair halved acute, Spikes subglobose terminal aggregated

and Miscellaneous Particulars.

this is half evaporated by boiling, the decoction, without straining, is poured into a flat earthen pot, boiled to one-third part, and then set in a place to cool for one day. The decoction is afterwards evaporated by the heat of the sun, stirring it several times in the day ; and when it is reduced to a considerable thickness, it is spread upon a mat or cloth, which has previously been covered with the ashes of cowdung. The mass is lastly divided into square or quadrangular pieces by a string, and completely dried by turning them in the sun, until they are fit for sale. This extract, when first introduced as a medicine into Europe, was named Terra Japonica, from the supposition that it came from Japan and was an earth.

Medicinally catechu is one of the most valuable of the vegetable astringents ; and as the dark colored contains the greater quantity of tannin, on which its astringency depends, it is to be preferred for medicinal use. It is employed with the best effects in dysentery and diarrhœa, when the use of astringents is admissible ; in alvine and uterine hæmorrhages, leucorrhœa, gleet, and in obstinate catarrhal affections. As a local astringent, it is used in sponginess of the gums, and aphthous ulcerations of the mouth and fauces, and we have found the slow solution of a small piece of it in the mouth, a certain remedy for the troublesome cough induced by a relaxed uvula hanging into and irritating the glottis. Dr. Paris recommends it as a dentifrice, especially when the gums are spongy.

A. vera produces the gum arabic of the shops. The tree is found in almost every part of Africa, but those

History, Use, Propagation, Culture.

which yield the gum which is exported from Barbary to Great Britain, grow principally in the Atlas mountains. It is a hard withered looking low tree, with a crooked stem, and a grey bark. The gum exudes naturally from the bark of the trunk and the branches, in a soft, nearly fluid state, and hardens in the air without losing its transparency. It is collected about the middle of December. It has a faint smell when first stowed in the warehouses, and is heard to crack spontaneously for many weeks.

Medicinally gum exerts no action on the living system, but is a simple demulcent, serving to lubricate abraded surfaces, and involve acrid matters in the primæ viæ. In the solid form it is scarcely ever given, unless to sheath the fauces, and allay the tickling irritation which occasions the cough in catarrh and phthisis pulmonalis; in which cases a piece of it is allowed to dissolve slowly in the mouth. It is chiefly used in a state of mucilage.

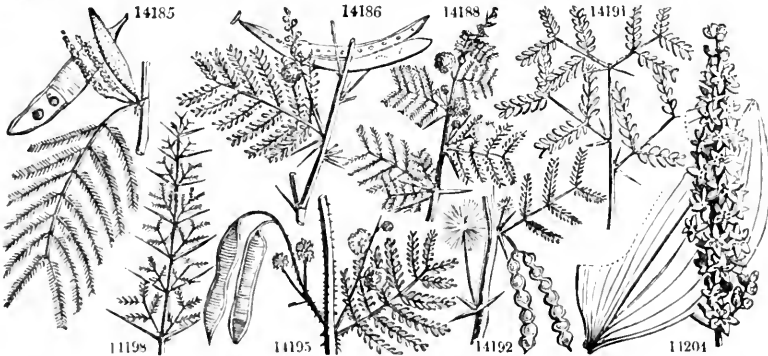

According to Sweet, all the species of *Acacia* are of easy culture. Those of the hothouse he recommends to be grown in loam and peat. "Cuttings," he says, "of most kinds will strike root. From the strongest growing kinds, take off large cuttings at a joint, and plunge them in a pot of sand under a hand-glass in the bark-bed.

- 14160 Lvs. bipinn.: partial of 4-5 pair; proper of 7-11 pair halved blunt smooth, Spikes subcapitate axill. aggregate
 14161 Lvs. bipinn.: partial of 5 pair; proper of 10 pair ellipt. blunt, Spikes globose stalked termin. with bractæe
 14162 Lvs. bipinn.: partial of 4 pair; proper of many pair oblong halved blunt, Spikes subglobose termin. aggregate
 14163 Lvs. bipinn.: partial of 5 pair; proper of about 10 pair discolored beneath, Spikes globose stalked racemose
 14164 Lvs. bipinn.: partial of 8 pair; proper of about 15 pair, Racemes axillary solitary, Heads globose stalked
 14165 Lvs. bipinn.: partial of 9-12 pair; proper of 20 pair lanc. veinless, A gland on stalk and betw. 2 term. petiol.
 14166 Lvs. bipinn.: partial of 8 pair; proper of many pair, A gland between the lowest pair of the partial ones
 14167 Lvs. bipinn.: partial of 12 pair; proper of many pair, A gland betw. every pair of partial ones, Spikes glob.
 14168 Lvs. bipinn.: part. of 11 pair; prop. of many pair, A gland betw. every pair of part. ones, Part. petiole marg.
 14169 Lvs. bipinn.: partial of 8-18 pair; proper of many pair lin. very close downy, A gland between every pair
 14170 Lvs. bipinn.: partial of 16 pair; proper of about 40 pair, A gland on petiole, Spikes glob. stalked axill. in 3s
 14171 Lvs. bipinnate: partial of 17 pair; proper of about 40 pair, Spikes subcapitate stalked racemose terminal
 14172 Leaves bipinnate: partial 5-6 pairs; proper of 18 distant pair, Spikes globose stalked axillary
 14173 Leaves bipinnate, Pinnæ of 4 or 5 pair, Leaflets of 12 or 15 pair oblong linear acute, Petiole downy
 14174 Lvs. bipinn.: partial of 5 pair; proper of many pair lin. acute, Spikes glob. axill. about 3, Cal. ciliat. at edge
 14175 Lvs. of 5 pair, Pinnæ of many pairs, Leaf. lin. acute ciliat. Rachis of lvs. downy, Heads axill. on long stalks
 14176 Leaves of 15 pair, Pinnæ of many pair, Leaflets equal-sided minute downy, Racemes lateral

* Spiny.

- 14177 Spines stipular, Leaves conjugate pinnate, Pinnæ of 4-6 pair, Pods spirally twisted
 14178 Spines stipular, straight almost length of leaf. Leaflets oblong linear obtuse dist. Petiole with a gland at end
 14179 Lvs. conjugate pinnate, A stalked gland betw. pinnæ which consist of 5-7 pair, Stip. spiny as long as leaves
 14180 Spines stipular twin, Lvs. bipinn.: partial of 2 pair; proper of 20 pair, Spikes axill. 2-3 cylind. pendulous
 14181 Spines stipul. in 3s: midd. one reflex. Lvs. bipinn.: part. of 5 or 6 pair; prop. of many pair, Spikes axill. cylind.
 14182 Spines stipul twin con. as long as lvs. Lvs. bipinn. Pinnæ 3 or 6 pair, Leaf. 20 pair, Gland betw. every pinnæ
 14183 Spines stipular twin incurv. Lvs. bipinn.: partial of 12 pair; proper of many pair, A gland on the petiole
 14184 Spines stipular twin hooked, Leaves bipinnate: partial of 12 pair; proper of many pair, A gland on the petiole and between the three terminal outer leaflets
 14185 Spines stipular twin hooked, Leaves bipinnate: partial of 10 pair; proper of many or downy, A gland on the petiole and between the two terminal outer leaflets
 14186 Spines stipular twin connate, Leaves bipinnate: partial of 6-10 pair; proper of many, A gland between the 2 pair of partial leaves
 14187 Spines stipular connate compressed, Leaves bipinnate: partial of 6 pair; proper of 20 pair smooth, A gland on the petiole
 14188 Spines stipul. connate twin, Leaves bipinnate: partial of 4 pair; proper of 6 pair, Spikes globose aggregate
 14189 Spines double slender and branches smooth, Branchlets, leaves, peduncles and fls. hoary
 14190 Spines stipular setac. dist. Lvs. bipinn.: partial 10 pair; proper many pair, A gland on petiole and between 2 term. pair of partial leaves
 14191 Spines stipular twin spreading, Leaves bipinnate: partial of 2 pair; proper of 8-10 pair, A gland betw. each pair of partial leaves
 14192 Spines stipul. twin spread. Lvs. bipinn.: partial of 5 pair; proper of many pr. Spikes globose axill. stalked
 14193 Prickly, Lvs. bipinn.: partial of 7 pair; proper of 16 pair, A gland on petiole, Spikes globose panic. term.
 14194 Prickly, Lvs. bipinn.: partial and proper of many pr. A gland on petiole, Com. ped. and petioles prickly at
 14195 Prickly, Leaves bipinnate: partial of 6 pair; proper of about 12 pair incurved, Petioles prickly [base
 14196 Prickly, Leaves bipinnate: partial of 5 pair; proper of 3 pair obovate 3-nerved
 14197 Prickly, Leaves bipinnate: partial of 5 pair; proper of 15 pair, Gland on petioles stip. and bractes cordate
 14198 Spines stipul. twin nearly as long as lvs. Lvs. bipinn. of 2 or 3 pr.: partial of about 10 pr. Spikes glob. stalked
 14199 Spines stipular twin connate, Leaves bipinnate: partial of 16 pair; proper of many pair, A gland on the petiole and between the two terminal pair of partial leaves
 14200 Spines stipular twin hooked, Leaves bipinnate, Pinnæ of about 10 pair, Leaflets of 10 or 12 pair ciliated
 14201 Spines stipul. twin straight subulate, Leaves bipinnate, Pinnæ of 3 or 4 pair, Leaflets of 13 pair ciliated
 14202 Spines stipular setaceous double, Leaves bipinnate, Pinnæ of 2 pair, Leaflets of 11-15 pair blunt smooth

- 14203 Racemes panicled, Bractes of branches oblong: partial as long as downy peduncle, Flowers erect
 14204 Racemes panicled, Bractes of branches oblong-lanceolate: partial longer than downy petiole

and Miscellaneous Particulars.

Of the smaller kinds take younger cuttings, and put them under a bell-glass, also plunged in heat. The sooner the plants are potted off after they are rooted the better. If they stay too long, the sand injures their roots: they should be kept under a close glass, and shaded for a few days after potting off, and exposed to the air by degrees." (*Bot. Cult.* 11.)

The greenhouse species are particularly valuable as flowering for the most part in winter, or early in spring; they are very hardy and grow freely in loam, peat, and sand well drained. Cuttings of most kinds, Sweet observes, will root pretty freely, taken off in the young wood and planted in sand, under a bell-glass, and plunged in a little bottom heat. The kinds that do not root readily from cuttings may be increased by taking off roots, as large pieces as can be spared, and planting them in the same kind of soil as the old plants, when they should be plunged under a hand-glass in a little bottom heat. Most of the kinds might be propagated by that means. (*Bot. Cult.* 126.)

1428. *Vesatrum*. Said by Lemery to be so called, because its root is *vere-atrum*, truly black. *V. album* has a fleshy fusiform root, beset with strong fibres, gathered into a head; this root and every part of the plant is

History, Use, Propagation, Culture,

extremely acrid and poisonous. It is used in medicine, and its properties are found to depend on veratrine, the same alkaline principle which is the active ingredient of colchicum. Medicinally it is violently cathartic and sterneratory. When taken internally, even in moderate doses, its operation is violent and dangerous; producing besides hypercatharsis, with bloody stools and excessive vomiting, great anxiety, tremors, vertigo, syncope, sinking of the pulse, cold sweats, and convulsions, terminating, if the dose be large, in death. Its external application to an ulcerated surface also produces griping and purging. Notwithstanding these effects, Veratrum has been exhibited internally, and with advantage, in mania, epilepsies, scabies, lepra, and obstinate herpetic eruptions. But the most ordinary use of white hellebore is as a local stimulant. When taken internally as a poison, the best antidote is a strong infusion of nut-galls. (*Thom. Lond. Disp. p. 545.*)

V. nigrum is very nearly allied to album, but differs in color, and seems not to be so strong and acrid in its qualities; for when both sorts are placed near each other, snails will entirely devour the leaves of this species, when they will scarcely touch those of the other.

2129. *Andropogon*. From *ανδρ*, a man, and *παυρον*, a beard. A hyperbolic comparison of the little tuft of hairs upon the flower to the beard of a man. *A. schœnanthus* has an agreeable smell, with a warm, bitterish, not unpleasant taste. It was formerly brought over from Turkey in bundles about a foot long, and kept in the shops to be employed as a stomachic and deobstruent, but it is now little used. All the species are of the easiest culture.

2130. *Chloris*. Derived from *χλωρος*, green, on account of the color of its herbage. Pretty little grasses, with beautiful one-sided spikes of silky flowers.

2131. *Sorghum*. *Sorgho* is the Indian name, according to Bauhin. *S. vulgare*, *grand millet*, Fr., *Saggena* or *Sorgo*, Ital., and *alcandina*, Span., is much cultivated in Arabia and most parts of Asia Minor. It has been introduced into Italy, Spain, Switzerland, and some parts of Germany; also into China, Cochinchina, and the West Indies, where it grows commonly five or six feet high or more, and being esteemed a hearty food for labourers, is called *Negro Guinea corn*. Its long awns or bristles defend it from the birds. In England, the autumns are seldom dry and warm enough to ripen the seeds well in the field. In Arabia it is called *Dora* or *Durra*. The flour is very white, and they make good bread of it, or rather cakes, about two inches in thickness. The bread which they make of it in some parts of Italy is dark and coarse. In Tuscany it is used chiefly for feeding poultry and pigeons; sometimes for kine, swine, and horses. Brooms are made of the spikes, which are also sent to this country for the same purpose. The Indian millet, as well as the common sort (*Panicum*), is cultivated in some parts of North America, and has been tried in this country, but it is only in the warmest autumns that it ripens its seeds. It might probably, however, be acclimated.

- 14205 Racemes panicle, Bractes shorter than peduncle, Petals with 2 glands at base
 14206 Racemes supradecomposed panicle, Bractes of branches linear-lanceolate very long
 14207 Racemes panicle, Petals bearing the stamens on their claw
 14208 Spike simple, Flowers twin : hermaphrodite sessile awned ; male stalked, Outer valve of cal. nerved
 14209 Spike simple, Lower flower beardless, Male and hermaphrodite calyxes hairy, Awns very long hirsute
 14210 Spikes imbric, conjug. panic. bract. Fls. in 3s : midd. hermap. beard. ; beard smooth : lat. stalk. male beard.
 14211 Spikes twin terminal, Florets twin bearded ; hermaphrodite sessile ; male bearded, Culm undivided
 14212 Spikes digitate about 3, Florets alternate sessile beardless
 14213 Spikes digitate about 8, Florets twin woolly at base : hermaphrodite sessile bearded ; male stalked bearded
 14214 Spikes 4-5-6 straight erect, Florets imbric, nearly smooth beardless, Outer valve of cal. beard. Culm compr.
 14215 Spikes digitate about 5 erect, Glumes ciliated
 14216 Spikes many fascicled nearly erect, Florets subulate smooth
 14217 Spikes many fascicled, Glumes ciliated bearded, Male valves ventricose bearded
 14218 Spikes many alternate panicle pendulous, Spikelets 4-flowered
 14219 Panicle contracted ovate, Florets strigose with down black, Seeds white round
 14220 Panicle contracted oblong, Florets obovate shining hairy, Seeds compressed
 14221 Panicle spreading, Florets oblong acute shining ciliated
 14222 Panicle effuse, Branches spreading, Florets villous oblong, Leaves broad lanceolate
 14223 Panicle spreading, Branches rough, Florets lanc. acute silky shining, Leaves lanceolate rough at edge
 14224 Panicle effuse spreading, Branches whorled 3-fl. Peduncles bearded, Leaves and sheaths hairy
 14225 Glumes 2-fl. hermaphrodite, Sessile floret beardless stalked bearded, Beard longer than flower
 14226 Glumes 2-fl. : hermaphrodite beardless, Beard of the male much shorter than flower recurved
 14227 Male flowers with a jointed beard twice as long as calyx, Joints of culm smooth, Root nouose
 14228 Male flowers with a jointed beard twice as long as calyx, Joints of culm villous, Root bulbous [Gm.
 14229 Panicle spread. Glumes 3-fl. beardl. Flor. heaped : hermap. in midd. diand. ; male triand. ciliat. *Hierochloa*

- 14230 Leaves lanc. Florets naked, Outer valve of cal. with 2 nodules on each side, Beard of cor. long twisted
 14231 Leaves lanceolate, Neuter florets intermediate wrinkled across : two lateral smooth

and Miscellaneous Particulars.

2132. *Holcus*. From $\delta\lambda\kappa\omega\varsigma$, to extract. It was a popular notion among the ancients, that the leaves of the plant they called *Holcus*, which seems to have been a grass of some kind, had the property of extracting thorns from the flesh. *H. mollis* is distinguished by its creeping roots, which, when once in possession of the soil, as Mr. Sinclair observes, can hardly be again expelled without great labor and expence. It is the true couch-grass of light sandy soils, and underground stolons have been found five feet in length, the growth of a few months only. These root-shoots contain a very considerable quantity of nutritive matter, which has the flavor of new made meal. Pigs are very fond of the roots, and dig them up with eagerness ; but the herbage is disliked by cattle, more than that of any other species of the genus, being extremely soft, dry, and tasteless. The best mode of banishing this weed from light arable lands, is to collect the roots with the fork after the plough. (*Sinclair, Hort. Gram.* 167.)

H. lanatus has a fibrous root, and grows on all soils from the richest to the poorest, but attains to the highest degree of luxuriance on light moist peaty soils. Cattle prefer almost any other grass to this ; it is seen in pastures with full grown perfect leaves, while the grasses that surround it are cropped to the roots. Its nutritive matter consists entirely of mucilage and sugar ; while the nutritive matters of grasses most liked by cattle are either sub-acid or saline. Mr. Sinclair suggests, that this grass might probably be made more palatable to cattle, by being sprinkled over with salt. (*Hort. Gram.* 164.)

H. avenaceus, the *Avena elatior* of Linnaeus, Curtis, and Host, is a bulky productive grass, eaten by horses, cattle, and sheep, but less nutritious than many other grasses. It pushes rapidly after being cropped ; and though later in flowering than many other species, produces an early and plentiful supply of herbage in the spring. These properties would entitle it to rank high as a grass adapted for the alternate husbandry, but its nutritive matter contains too large a proportion of bitter extractive and saline matters to warrant its cultivation, without a considerable admixture of different grasses ; and the same objection extends to its culture for permanent pasture. It is always present in the composition of the best natural pastures, and, as before mentioned, eaten in common with other grasses. It does not, however, constitute a large proportion of the herbage, but rather the least of any of the more valuable grasses that have been mentioned. (*Hort. Gram.* p. 171.) This grass and *Panicum repens* are the two species eaten by dogs to excite vomiting. One variety has bulbous roots, and is a noxious weed in arable lands.

H. odoratus is one of the earliest flowering grasses ; but it is tender, the spring produce of herbage is considerable, and its powerful creeping roots render it unfit for agricultural purposes. (*Hort. Gram.* 163.)

2133. *Ischaemum*. From $\iota\sigma\chi\alpha\mu$, to stop, and $\alpha\iota\mu\alpha$, blood. Piny says, that the Thracians first discovered that the woolly seed which is borne by the *Ischaemum*, if introduced into the nostrils, has the power of stopping the bleeding at the nose. Useless grasses.

History, Use, Propagation, Culture,

2134. *Egilops.* From *αιξ αγρος*, a goat, and *οφ*, the eye. The ancients believed that the plant they named *Egilops* had the power of curing a disease of one corner of the eye, which seems to have been what we call *Fistula lachrymalis*. The *Egilops ovata* is a common Sicilian grass; when ripe, it is gathered by the peasantry, who tie the heads up in bunches, and set them on fire; they burn with rapidity, and so give the grains a slight roasting, which are then considered agreeable food.

2135. *Manisuris.* Said to be so called, from *μανος*, relaxed, and *ωρα*, tail, or, in botanical language, a head of grass; because the spikes are loose, and not compact. A curious little plant remarkable for its wrinkled grains.

2136. *Valantia.* Miserable weeds of no beauty or use; called by their present name by Linnæus in reference to Sebastian Vaillant, a learned and excellent French botanist, who died in 1722. The author of the name would have employed his time better in considering the botanical writings of Vaillant, than in identifying with the most worthless part of vegetation an author whose merits he was not able to understand. No man was more given to sneers of this kind than Linnæus; and yet his followers manifest a most extraordinary degree of sensitiveness whenever he is retorted upon in a similar way; although few ever deserved criticism in some things in a higher degree than himself.

2137. *Parietaria.* From *paries*, a wall. Weeds which are commonly found upon old walls, or rubbish heaps. *P. officinalis* presents some curious anomalies in its inflorescence and fructification. To obtain a perfect idea of

- 14232 Spike ovate, Cal. all with 4 beards scabrous, Culms ascending
 14233 Spike cylind. Lower cal. with 2 beards: the rest with 3, Beards of 2 terminal florets longer than the rest
 14234 Spike cylindrical, Cal. with 1 beard, Cor. beardless, Terminal beards very long
 14235 Spike cylindrical, Cal. 2-toothed beardless, Cor. with 1 beard
 14236 Spike cylindrical, Cal. 2-toothed: teeth unequal beardless, Valves of terminal floret with 1 valve only
- 14237 Valves of female fl. globose tessellated warted, Culm erect branched, Sheaths hairy
- 14238 Leaves 4 ellipt. obl. 3-nerved netted hispid, Peduncles branched smooth bracted, Fruit smooth
 14239 Leaves 4 elliptical netted smooth, Male fl. trifid attached to the base of the hermaphrodite
 14240 Leaves 4 obovate-oblong veinless roughish, Male fl. trifid attached to the base of the hermaphrodite
 14241 Leaves 4 oblong ciliate toothletted netted smooth, Ovary oblong chaffy longer than pedicel
 14242 Leaves 4 oblong ciliate hispid, Pedunc. subfifid ciliated, Male fl. trifid, Ovary smooth
 14243 Leaves 4 oblong, Peduncles protected by the ovate deflexed bractea, Stem erect
 14244 Leaves 6 linear lanceolate hispid at edge, Pedunc. 2-fl. naked, Male fl. trifid, Fruit warted
- 14245 Male fl. 4-fid, Pedunc. dichotomous leafless, Leaves cordate
 14246 Leaves 4 elliptical ciliated, Pedunc. branched naked and fruit smooth
 14247 Leaves 6 linear very rough at edge, Stalk and fruit hispid
- 14248 Leaves lanceolate, Stem erect
 14249 Leaves oblong ovate acuminate at each end with pellucid dots, Pedunc. dichotomous, Cal. 2-lcaved
 14250 Leaves ovate, Stem erect, Invol. 3-flowered, Male corollas long cylindrical
 14251 Leaves oblong lanceolate veiny with opaque dots, Involucre longer than flowers
 14252 Leaves opposite stalked ovate serrated veiny downy, Flowers axillary
 14253 Leaves roundish ovate obtuse the length of petiole, Stems filiform procumbent
 14254 Leaves linear lanceolate subsessile hairy, Invol. longer than flower
- 14255 Stem shrubby, Leaves alternate or opposite oblong subrhomboid entire
 14256 Stem shrubby, Leaves obovate-lanceolate entire silvery white
 14257 Stem half-shrubby procumbent, Leaves ovate sessile entire: lower a little toothed
 14258 Stem shrubby erect, Leaves hastate entire acute, Spikes terminal
 14259 Stem herb. spreading, Leaves triangular hoary unequally toothed, Cal. of fruit quadrang. toothed
 14260 Stem herbaceous spreading, Leaves rhomboid somewhat toothed, Cal. of fruit muricate toothed
 14261 Stem herbaceous erect, Leaves oblong sinuate cuneate at base hoary beneath, Cal. of fruit toothed
 14262 Stem herbaceous erect, Leaves triangular toothed whole-colored, Cal. of fruit ovate netted entire
- 14263 Stem herbaceous diffuse, Leaves ovato-deltoid dentato-sinuate very mealy beneath [tuberculat. at side
 14264 Stem herb. spreading, Lvs triang. hast. glab. above irregul. tooth.: upp. ones ent. Cal. of fr. more or less
 14265 Stem herb. spread. Lvs. lanc. ent.: lower ones somew. hast. Cal. of fruit hastate slightly tuberculat. at sides
 14266 Stem herbaceous erect, Leaves ovate-lanceolate; lower sinuate, Cal. of seeds muricated
 14267 Stem herbaceous erect, Lvs. all linear ent. or toothed, Perianth. of fruit sinuate and muricated on back
 14268 Stem herbaceous flexuose spreading, Leaves obovate entire, Female flowers stalked uniform
 14269 Stem herbaceous erect, Leaves triang. hastate acutish a little toothed, Cal. of fruit ovate acute entire
- 14270 Branches diffuse, Leaves nearly opposite rhomboid-hastate entire smooth, Spikes terminal leafless

and Miscellaneous Particulars.

the manner in which this is carried on, the flowers should be examined at a very early period of their expansion. The manner in which the stamens shed their pollen is curious. The filaments on their first appearance all bend inwards; as soon as the pollen is arrived at a proper state to be discharged, the warmth of the sun, or the least touch from the point of a pin will make them instantly fly back, and discharge a little cloud of dust. This process is best seen in a morning, when the sun shines on a plant in July or August: if the plant be large, numbers will be seen exploding at the same instant. Mr. Curtis remarks, that the same degree of cold (thirty-one Fahrenheit) which strips the mulberry of its leaves, will destroy the herbage of *Paricetaria*. The ashes of the plant are said to contain a considerable quantity of nitre.

2138. *Atriplex*. The same name as *Atraphaxis*, which see. *A. Halimus* ($\alpha\lambda\mu\mu\sigma$, maritime) grows on the sea-coast of the south of Europe, and in this country its silver-colored foliage adds to the variety of our shrubberies. *A. portulacoides* requires to be planted on a poor gravelly soil; in its native state it prefers the seashore and salt marshes. *A. hortensis*, sometimes called mountain spinach, was formerly cultivated as a culinary herb, and is still grown to a considerable extent in the neighbourhood of Paris, and the leaves gathered as spinach. There are several varieties more or less tinged with red or purple. The leaves of all the species may no doubt be used as pot-herbs.

2139. *Rhagodia*. From $\rho\alpha\gamma\omega\delta\eta\varsigma$, bearing berries.

History, Use, Propagation, Culture,

2140. *Terminalia*. Because the leaves grow in bunches at the termination of the branches. The species grow in loam and peat, and ripened cuttings, with their leaves on, will root in sand closely covered.

2141. *Fusanus*. The ancient name of the *Euonymus*. This plant resembles it in foliage. A little Cape shrub, formerly included in *Thesium*.

2142. *Brabejum*. From *βραβιον*, a sceptre. The elegant racemes of splendid flowers may well be compared to a sceptre.

2143. *Acer*. A Latin word signifying vigorous or sharp. The wood was formerly manufactured into the heads of pikes and other weapons. The species consist of trees, most of them yielding a saccharine juice from the trunk, branches, and leaves. A *Pseudo-Platanus*, *Plane tree*, Scot., grows wild in Switzerland, Germany, Austria, and Italy. It is remarkably hardy, and will grow with an erect stem, exposed to the highest winds, or to the sea-breeze. It is in leaf by the middle of April; and on their first appearance the leaves are of a pleasant green, but they exude a clammy juice so abundantly, that they attract a variety of insects, which soon perforate and disfigure them. The flowers of none of the species are of any beauty. The shade of the tree is said to do less damage to pasture than most trees. The timber was formerly much used by the turner, and is still in repute by the saddle-tree maker and the millwright. In spring and autumn, if the trunk be pierced, it yields abundance of juice, from which a good wine may be made, or sugar to a certain extent procured by evaporation. A. rubrum grows in swamps in Pennsylvania, where the natives use it for almost all sorts of wood-work; with the bark they dye a dark blue, and make a good black ink. The Canadians tap the tree for the juice, of which they make sugar and treacle. The scarlet flowers of this species come out in spring before the leaves; they are without petals, and have not more than six stamens.

A *saccharinum* bears a considerable resemblance to *A. platanoides*, especially when young. From this tree, and probably also from other species, the inhabitants of North America make a very good sort of sugar. The trees are tapped in February, March, and April, during warm days and frosty nights. The incision is made with an axe or auger, or about two inches deep. A spout of sumach or elder is introduced, through which the sap flows, from four to six weeks, into a trough, whence it is carried daily to a larger receiver; from which it is conveyed after being strained to the boiler. The boiling and refining process is or should be carried on in the same manner with that for the cane sugar in the West Indies. A tree of an ordinary size yields in a good season from twenty to thirty gallons of sap, from which are made from five to six pounds of granulated sugar.

A. platanoides grows on the mountains of the northern counties of Europe, descending in some places to

 14300 Leaves unequal at base ovate acuminate serrated smoothish on each side

and Miscellaneous Particulars.

Norway to the sea-shore. It abounds in the north of Poland and Lithuania, and is common through Germany, Switzerland, and Savoy. On a tolerable soil it attains a large size, and the leaves being smooth and of a shining green, as large or larger than those of the sycamore, and being seldom eaten or defaced, because the tree abounds in a sharp milky juice disliked by insects, they have a much better appearance than those of the sycamore; and in the spring, when the flowers are out, which are of a fine yellow color, this tree has great beauty. Hanbury observes, that in the autumn the leaves die to a golden yellow color, which produces a good effect at that season, when the different tints of the decaying vegetable world are displayed. He says further, that it is a quick growing tree, arrives at a great bulk, and is one of the best trees for sheltering habitations. Linnæus recommends it for sheltering walks and plantations; as yielding a juice from which sugar may be made, if it be wounded in the winter; and as cutting out into a white smooth wood, fit for the stocks of guns, the joiner and the turner. Dr. Hunter observes, that it is a quick grower, arrives at a great bulk, and answers all the purposes of the sycamore; the raising it for use, as well as ornament and variety, should not be neglected. (*Mill. Gard. Dict.*)

A. striatum has a slender stem, with a smooth bark beautifully varied with green and white stripes, the boughs of a shining red in winter. The thickness of the shade, the beauty of the bark, and the tree not being liable to insects, render it very desirable for ornamental plantations; the only objections to it are, that it is subject to be injured by storms, and that the abundance of its foliage and seeds occasions a great litter: in autumn.

A. campestre forms a very picturesque little tree, and the timber is said to be far superior to that of the beech or the sycamore for the purposes of the turner. It is also frequently substituted for that of the holly and box by the mathematical instrument maker.

A. Opalus is a noble tree, with large and beautiful foliage, throwing an extensive shade; it is much prized in Italy for planting by avenues and public walks. All the species are easily raised from seed, though the ash-leaved and some other species are occasionally propagated by layers and cuttings; the cuttings should be cut off at a joint, and, as in the case of most hardy trees and shrubs, they succeed best when planted in the autumn in a sheltered situation in the open ground.

214. *Negundium*. A genus obviously distinguished from *Acer* by its pinnated leaves. A fine ornamental tree, called in North America black ash. There is another species in China.

215. *Celtis*. One of the names anciently given to the *Lotus*. Tournefort first applied the name to the modern genus, which may be said to resemble both in fruit and foliage the shrubby *Lotus* of the ancients.

History, Use, Propagation, Culture.

C. australis, sometimes called the lote tree, is reckoned among the largest timber trees of the south of Europe. The wood is one of the hardest we are acquainted with; it is also very tough and flexible. In France, the forked branches are peeled, and cut so as to resemble rude hay-forks, and in that state used for various agricultural purposes. The leaves have a cheerful light green color; the berries are the size of a small cherry, first yellow and then black; they are eaten by birds and children.

C. occidentalis bears a great resemblance to the first. The leaves come out late in the spring, but they are also the latest in fading of any of the deciduous sort; the timber is tough and pliable, and imported by coach-makers for the frames of their carriages. It grows more freely in this country than the European species, and in some years bears abundance of fruit.

C. orientalis is a low-spreading tree or bush; the timber is white, and yields a gum like that of the cherry. *C. aculeata* is an inelegant little tree, with a drupe double the size of a pea, which is eaten by the natives of the Caribbee Islands and the neighbouring continent. All the species are easily increased by layers or seeds.

2146. *Gouania*. Antoine Gouan was professor of botany at Montpellier in the middle of the eighteenth century, and was a good botanist. The species are increased by ripened cuttings under a hand-glass in heat.

2147. *Hermas*. A name, the meaning of which is wholly unknown. An inconspicuous starved-looking plant of no known use; whence it is called *depauperata*.

2148. *Bridelia*. Named in honor of Professor Bridel, the celebrated muscologist. Small bushes or trees, with little beauty to recommend them.

2149. *Feronia*. Elegantly named by the classical Correa de Serra, after Feronia, the goddess of the forests. This is a noble Indian timber tree, bearing a fruit not unlike an orange, to which it is botanically related.

2150. *Ailanthus*. Derived from *Ailanto*, the name of one species in the Moluccas. The usual way of writing it, *Ailanthus*, is therefore incorrect. *A. glandulosa* is a tree which may be compared to a gigantic stag's-horn sumach; it has very large leaves, unequally pinnate, with foot-stalks from one to two feet in length, and numerous flowers in a terminating pedicel, which exhale a disagreeable odor. The tree grows very fast, and on very poor soil, especially if it be calcareous. If the bark be wounded, a resinous juice flows out, which hardens in a few days. The wood is hard, heavy, glossy like satin, and susceptible of a very fine polish. It is propagated by cuttings of the roots. In general the trees bear only male flowers; but in France it has produced both male and female flowers, and fruit twice in ten years.

2151. *Clusia*. So called, in honor of the celebrated Charles de l'Écluse, born at Artois in 1526, and died in 1609. He was one of the most excellent botanists who ever lived, and author of many works whose value will only cease with the world. But he is not more known for his mental excellence, than for his personal calamities. In his early youth he undertook to travel through Portugal, Spain, England, Hungary, and other countries in pursuit of plants; no easy task in those days. By excessive fatigue he contracted, so soon as in his twenty-fourth year, a dropsical complaint, of which he was afterwards cured with chicory by the celebrated

and Miscellaneous Particulars.

Rondelet. See *Rondeletia*. At the age of thirty-nine he broke his right arm, during one of his botanical rambles; and a short time afterwards his right thigh. When fifty-five, he dislocated his left ankle while at Vienna; and eight years after his right hip. Having been unskillfully treated, he was ever after obliged to walk with crutches. The consequent deprivation of his natural exercise brought on other diseases, among not the least distressing of which were calculus and hernia. After having been the director of the Imperial Gardens of Vienna for fourteen years, he finally returned to his native country, Manders. He was named professor of botany at Leyden, where he gave botanical lectures for sixteen years, when he died overwhelmed by the multitude of his bodily infirmities, but retaining his faculties unimpaired to the last.

The species are trees abounding in a tenacious glutinous juice, of a balsamic flavor, whence the English name. *C. rosea* has handsome flowers, in which the stamina and pistillum are covered with a gelatinous gluten. The fruit is green and of the size of a middling apple, with eight lines running, like meridians on a globe, from the stalk to the crown of it. When it ripens, it opens at these lines, and divides into eight parts, disclosing many mucilaginous scarlet seeds, resembling those of the pomegranate. The whole tree is exceedingly beautiful, and the structure of the fruit is a most exquisite piece of mechanism. It grows on rocks, and frequently on the trunk and limbs of trees, occasioned by birds scattering or voiding the seeds, which being glutinous, like those of the mistletoe, take root in the same manner; but the roots not finding sufficient nutriment, spread on the surface of the tree till they find a decayed hole, or other lodgment, wherein is some small portion of soil; the fertility of this being exhausted, a root is discharged out of the hole till it reaches the ground, where it fixes itself, and the stem becomes a large tree. Roots have been known to do this at forty feet from the surface. The resin is used to cure sores in horses, and instead of tallow for boats.

C. alba is an elegant tree, and epiphytical on other vast trees, like the foregoing; the trunk is frequently a foot in diameter, and supports a spreading head. The whole abounds in a balsamic juice, of a green color, but becoming of a brownish color on being exposed to the air. The flowers are white, and of no great beauty; the fruit scarlet, with a scarlet pulp; the birds are very fond of them, hang over them on the wing, and pluck out the seeds with the pulp adhering.

C. flava bears in all respects a considerable resemblance to the former. A very good idea of the progress of culture since Miller's time, may be formed by comparing his directions for propagating this plant, and those of Sweet. Mr. Miller says, the best way is to have them brought over in tubs from the West Indies: according to Sweet, the pots should be well drained, the soil for rooted plants should be a light sandy loam, and "cuttings root very freely in sand under a hand-glass."

2152. *Ophiorhizon*. From $\sigma\tau\epsilon\iota\varsigma$, serpent, and $\rho\acute{\upsilon}\lambda\omicron\varsigma$, wood. In Ceylon they employ the plant in cases of the bite of serpents. It grows freely in a mixture of loam and peat, and may be increased by cuttings in sand under a hand-glass.

2153. *Ithaps*. So named by Loureiro, from $\rho\alpha\alpha\tau\epsilon\iota\varsigma$, a needle, on account of the acute awns of the corolla, which stick into the clothes. Culture as in the other palms; that is, abundance of heat and room, both for the roots and top.

DICECIA.

History, Use, Propagation, Culture,

2154. *Chamærops*. This word is said by etymologists to be synonymous with χαμαιδενδρον, or χαμαιδενδρον, a dwarf oak. The modern genus consists of ornamental palms, which are fine hardy greenhouse plants.

2155. *Gleditschia*. Called in honor of John Gottlieb Gleditsch, a native of Leipzig, and member of the academy of Berlin, and the author of several works, among which his Arrangement of Fungi, published in 1753, and his Botanical System, are the most remarkable. *G. triacanthos*, the honey locust of North America, attains the size of a large tree, but very seldom flowers and ripens its seeds in this country. All the species grow in common garden soil, and are generally raised from seeds.

2156. *Ceratonia*. This name has been derived from κερως, a horn, in allusion to the long horn-like pods of this plant, which contain a sweet fecula, for the sake of which they are often imported from Spain under the name of the Algaroba bean. This last word is a slight alteration, by the prefix of the article *al*, of the Arabic name of the tree, *Kharroûb*, whence also the seeds are eaten, it is called Saint John's bread. Ignorance of the locust-tree of scripture; and in Spain, where the seeds are eaten, it is called Saint John's bread. Ignorance of eastern manners and natural history, Professor Martin observes, induced some persons to fancy that the locusts on which John the Baptist fed, were the tender shoots of plants, and that the wild honey was the pulp of the pod of the Carob, whence it had the name of Saint John's bread. There is better reason to suppose, he adds, that the shells of the carob pod might be the husks which the prodigal son desired to partake

DIOECIA.

- 14319 Fronds palmate with spiny stalks, Spathe simple
 14320 Fronds palmate with spiny stalks, Caudex creeping
 14321 Stem creeping, Stalks with very long entangled prickles, Fronds palmate
 14322 Fronds palmate with unarmed stalks, Spathes double, Stem arboreous

14323 Branches spiny, Spines thick triple, Leaflets linear oblong, Pods many-seeded

- 14324 Spines short thick triple, Leaflets oblong blunt, Pods oblong short
 14325 Branches somewhat spiny, Leaflets ovate-oblong, Pods 1-seeded

 14335 Leaflets oblong lanceolate subserrated, Wing of fruit stalked cuneate emarginate, Buds fuscous
 14336 Leaflets subsessile lanc. ellipt. serrated downy beneath, Branches square with winged angles, Buds grey
 14337 Leaflets subsessile serrated outwardly and fruit lanceolate elliptical
 14338 Leaflets ovate oblong, unequally serrate about 11 smooth stalked, Branchlets smooth, Buds fuscous
 14339 Leaves of 5 pair smooth above, Veins above hairy, Leaflets oblong subsessile unequally toothed
 14340 Lvs. of 6 pair somewhat downy ben. Leaf. on long stalks oblong acute sinuate, Petioles somewhat powdery
 14341 Lvs. of 3 pair coriaceous a little downy ben. Leaf. obl. acute somewhat toothed, Veins and petioles ben. pink
 14342 Lvs. of 3 pair shining above ben. with the petioles downy, Leaflets obl. lanc. acuminate, Branches hirsute
 14343 Lvs. of 3 pair shining above with veins downy ben. Leaflets oblong acute finely serrated, Branches green
 14344 Lvs. of 3 pair smooth, Veins ben. rather hairy, Leaflets lanc. unequally toothed, Buds lin. cinereous hairy
 14345 Lvs. of 3 pair beneath and petioles hirsute, Leaf. lanc. unequally and finely toothed acum. Branches grey
 14346 Lvs. of 3 pair smooth, Veins ben. rather hairy, Leaf. obl. acute toothed, Branches cinereous hairy at base
 14347 Leaves of 3 pair downy beneath, Leaflets ovate acute equally toothed, Buds tawny
 14348 Lvs. of 3 pair hairy ben. Leaflets oblong mucronate somewhat toothed, Branches brownish-black, Buds tawny
 14349 Leaves of 3 pair smooth, Leaflets oblong acute subsinate toothed, Branches blackish
 14350 Lvs. of 3 pair smooth above, Veins beneath villous, Leaf. obl. mucron. equally toothed, Branches fuscous
 14351 Leaves of 2 pair with rufous hairs beneath, Leaflets lanceolate acuminate cuspidate unequally toothed
 14352 Leaves of 3 pair smooth, Leaflets subsessile ovate lanceolate toothed, Branches yellow
 14353 Leaflets somewhat stalked lanceolate acuminate serrated smooth cuneate at base, Branches flat smooth

14354 Leaf. somewhat stalked lanceolate acuminate serrate smooth, Branches round warted

14355 Leaves simple and compound tooth-serrated, Buds black

and Miscellaneous Particulars.

of with the swine. The tree is very common in the south of Spain, and the seeds or beans, as they were there called, often formed the principal food of the British cavalry horses during the war of 1811 and 1812. In our greenhouses the plant seldom flowers, but it grows very well in loam and peat, and ripened cuttings root in sand under a hand-glass.

2157. *Fraxinus*. The origin of this word is far from certain. Linnaeus says, it has been taken from the Greek *φραξις*, a separation, in allusion to the facility of splitting its wood. De Theis remarks, that M. A. Dureau de la Malle has proved, in a learned dissertation published in 1804, that the *Fraxinus* of the Latins and the *Melia* of the Greeks are our *Ornus europæus*, while the *Ornus* of the Latins and the *Boumelia* of the Greeks are, in fact, our *Fraxinus excelsior*, or common ash. *Le Frêne*, Fr., *Esche*, Ger., and *Frassino*, Ital. The English name is from the Celtic *æsc*, a pike. *F. excelsior* is one of the most useful of our native timber trees. It is peculiarly adapted for implements of husbandry, and the coachmaker and wheeler; it makes excellent fuel, with very little smoke; good hop-poles and hoops, excellent handles for tools, and very good walking-sticks. Its period of leafing is very late, being seldom earlier than the last week of April, and not unfrequently about the middle of May: the leaves have been used to adulterate tea; they are bitter, and said to communicate a rank taste to the milk and butter of cows which eat them. The roots spread to a great extent, and lie very near the surface; and these, together with the shade of the head, are found very injurious to hedges and pastures. The variety of this species, *F. pendula*, was first discovered in a field at Gamblingay,

History, Use, Propagation, Culture,

in Cambridgeshire. There are other varieties with curled leaves, striped leaves, variegated bark, &c. and some consider *F. simplicifolia* only a variety. *F. Americana* is a lofty tree, in few respects different from the common ash. Those species which do not produce seeds, are readily increased by grafting.

Little is known of the qualities of the greater part of the numerous varieties of American ash, distinguished by Bosc. They probably all form fine trees; the young plants in our gardens grow freely, and exhibit indications of valuable properties as ornamental trees.

2158. *Brosimum*. From *βρωμος*, good to eat. *B. Alicastrum* is common in the woods of Jamaica. The timber is not despicable; but the leaves and younger branches are more useful, and a hearty fattening fodder for all sorts of cattle. The fruit, boiled with salt fish, pork, beef, or pickle, has been frequently the support of the negroes and poorer sort of white people in times of scarcity, and proved a wholesome, and not unpleasent food, when roasted, it eats something like our European chestnuts, and is called bread-nut. The leaves and younger shoots are full of gum, which renders them disagreeable to most cattle at first, but they soon grow very fond of them.

B. spurium is also common in woods in the West Indies, but its timber is of little value. In our stoves both species thrive well, and like loamy soil; and old cuttings, with their leaves on, root in sand in moist heat.

2159. *Diospyros*. From *Διος σπυρος*, the fruit of Jove, or heavenly fruit. It has been fancied that the European species of this plant produced that famous fruit, which, according to ancient romancers, caused oblivion. *D. Kaki* is a valuable Japanese tree, which bears the fruit sometimes received from China in a dried form under the name of dates. *D. discolor* also bears a fine fruit. *D. lotus* produces fruit the size of a

- 14356 Leaves simple blistered ovate coarsely serrated dark-green quite smooth
 14357 Leaf. ovate subsessile acute mucronate serrate smooth cuneate at base

 14378 Leaves obovate retuse toothletted, Flowers axillary clustered, Stamens included
 14379 Leaves ellipt. Corymbs axillary aggregate

- 14380 Leaves oblong lanc. subcoriaceous entire, Flowers axillary clustered

- 14381 Leaves oblong entire acute at each end, Petiole middle rib and edge villous, Female peduncles about 3-f.
 14382 Leaves ovate-oblong entire acute at each end smooth, Female peduncles 2-flowered
 14383 Leaves cordate ovate slightly serrated glaucous beneath, Flowers in globose heads, Drupes oblong
 14384 Leaves on long stalks obl. acuminate remotely serrate downy beneath, Female peduncles 1-flowered

- 14385 Leaves on short stalks obl. nearly entire cuneate at base whitish beneath, Female peduncle 1-f.
 14386 Leaves on long stalks obl. acuminate remotely serrated smooth on both sides, Female pedunc. 1-f.

- 14387 Leaves oval-oblong acuminate entire

- 14388 Leaves stalked oblong acute serrated coriaceous veiny smooth

and Miscellaneous Particulars.

cherry, yellow when ripe, sweet, and somewhat astringent; they are recommended as a cure for the diarrhœa. *D. virginiana* has a white brittle wood, covered with a dark brown bark. The fruit is in form and bigness like a date, very firm, like that fruit, and almost as sweet, with a large kernel.

2160. *Myrsine*. A Greek word synonymous with Myrtle. Modern botanists have applied the name to a genus of African myrtle-like shrubs. The species grow freely in loam and peat, and are increased by young cuttings in sand under a hand-glass.

2161. *Nyssa*. A name of a nymph, according to Linnæus. The species are large shrubs, which grow freely in any soil or situation, but prefer moisture. *N. denticulata* grows naturally in wet swamps in Carolina and Florida, and rises there to the height of eighty or hundred feet. Marshall, in his American Grove, describes it as a tree of great singularity and beauty. It produces fruit about the size and shape of small olives, which are preserved like them by the French inhabitants of the Mississippi, where it greatly abounds, and is called the olive-tree. The timber is white and soft when unseasoned, but light and compact when dry, which renders it very proper for the carver and turner. All the species are readily propagated by layers or seeds.

2162. *Hamiltonia*. Dedicated by Muhlenburg, to Mr. Hamilton, an American botanist. A shrub growing to the height of from three to six feet. The flowers grow in terminal racemes from an inch to an inch and a half long.

2163. *Laurophyllus*. An hybrid name created by Thunberg, to express the resemblance of the leaves, $\zeta\lambda\lambda\alpha$, to a laurel. A shrub with stalked, oblong, acute, serrated, coriaceous leaves, and minute flowers growing in panicles three or four inches long.

History, Use, Propagation, Culture.

2164. *Bursera*. So called after Joachim Bursar, a disciple and friend of Caspar Bauhin, and professor of botany at Sara, in Naples. He is said to have left behind him an Herbarium, in twenty-five volumes. *B. gummifera* is a large tree with a fine leafy head, and abounds in copious watery balsamic fluid, which soon becomes inspissated by exposure to the air. The root is said to possess the same properties as *Quassia*. Hedges are made of it by the Spanish residents in South America, who call it *Almacigo*.

2165. *Arctopus*. Literally, bear's foot, *αρκτου πους*. An inconspicuous prickly umbelliferous plant. The roots are used with success at the Cape, in cases of syphilis; but upon trial here some years since, they were found to be less efficient than Sarsaparilla.

2166. *Panax*. A high-sounding title, meaning little less than that the plant which bears it is the long sought *universal elixir*; the name has been taken from *παν*, and *ακος*, a remedy; a remedy for all things. *P. quinquefolium* is a native of Chinese Tartary, and also of North America. In the former country it has been gathered as an invaluable drug from time immemorial. The roots, which are said to bear some resemblance to the human form, are gathered and dried, and enter into almost every medicine used by the Tartars and Chinese. Osbeck says, that he never looked into the apothecaries' shops, but they were always selling Ginseng, that both poor people and those of the highest rank made use of it, and that they boil half an ounce in their

14389 Racemes axillary, Leaves pinnated with an odd one, Leaflets ovate acute

14390 Leaves prickly with stellate spines

14391 Stem herbaceous, Leaves ternate or quinate, Leaf. ovate acuminate serrated

14392 Stem herbaceous, Leaves ternate or quinate, Leaf. oblong lanc. serrated

14393 Leaves ternate: the upper near the flowers clustered simple, Petioles and branches prickly

14394 Leaves supradecomposed toothed-ciliated, Stem shrubby

14395 Leaves cordate 3-5-lobed repand-toothed: Lobes blunt rough above downy beneath

14396 Leaves ovate with a short point netted beneath very smooth

14397 Leaves oblong 3-lobed and sinuated entire rough on each side

14398 Leaves cordate roundish mucronate entire glabrous glaucous beneath

14399 Leaves ovate oblong entire acute blunt at base smooth

14400 Leaves subcordate ovate with very long points

14401 Leaves ovate entire very blunt rounded at base subcordate 5-nerved

14402 Leaves oblong ovate entire acute subcordate at base impressed with dots on the upper surface

14403 Leaves oblong pointed smooth on both sides widely toothed, Branches covered with brown hairs

14404 Leaves oblong smooth narrowed at base cordate coriaceous, Veins immersed

14405 Leaves ovate blunt soft with down beneath

14406 Leaves ovate-cordate with a deep narrow sinus quite entire smooth acute green on each side

14407 Leaves ovate-cordate entire smooth blunt 3-nerved at base, Branches erect

14408 Leaves cordate oblong with a short point obtuse smooth with parallel nerves

14409 Leaves oblong-lanc. entire narrowed and acute at end rounded at base with white dots above

14410 Leaves obl. quite entire narrowed and acute at end rounded and subcord. at base: with punctures above

14411 Leaves ovate tapered at the base with a long point

14412 Leaves ovate-obl. entire acuminate blunt obsolete cordate at base

14413 Leaves ovate unequal-sided toothed acuminate rough on each side

14414 Leaves ovate-lanc. entire slightly cordate at base

14415 Leaves cordate oblong entire nerved shining

14416 Leaves ovate-oblong bluntly serrate crenate hairy on each side

14417 Leaves oval acute serrated rough above soft beneath

14418 Leaves ellipt. entire rounded at each end smooth: young ones rusty with down beneath

14419 Leaves smooth elliptical entire shining very large

14420 Leaves oblong ovate blunt smooth, Fruit twin globose sessile

14421 Leaves oblong acuminate blunt tapered at base netted beneath, Stipules scarious

14422 Leaves ovate blunt entire cordate unequal at base, Stipules membranous twin persistent, Stem creeping

14423 Leaves ovate blunthsh entire netted beneath

14424 Leaves obliquely ovate blunt

14425 Leaves broad lanc. with a short point tapered at base shining very smooth netted beneath

14426 Lvs. ellipt. obl. ent. narrow. at base bluntly acum. at end with fine parallel veins; dotted with white above

14427 Leaves cordate lanc. repand toothed obtuse downy beneath

14428 Leaves obl. acuminate entire narrowed at base about 3-nerved with parallel veins

14429 Leaves obovate entire with very short points and fine parallel veins shining smooth

14430 Leaves ovate acuminate entire acute at base

14431 Leaves obl. with short points entire smooth

14432 Leaves cordate ovate acuminate vein very smooth, Fruit stalked globose smooth

14433 Leaves oblong-lanc. acute quite entire somewhat narrowed at base 3-nerved vein dotted beneath

14434 Leaves ovate entire blunt smooth, Branchlets furrowed

14435 Leaves cordate ovate acute serrated unequal at base scabrous above hairy beneath, Stem creeping

14436 Leaves oblong acuminate tapered at base, Branches pinnous

and Miscellaneous Particulars.

tea or soup every morning, as a remedy for consumption and other diseases. Jartoux relates, that the most eminent physicians of China have written volumes on the medicinal powers of this plant, ascribing that it gives immediate relief in extreme fatigue, either of body or mind, that it dissolves pituitous humours, and renders respiration easy, strengthens the stomach, promotes appetite, stops vomiting, removes hysterical, and hypochondriacal, and all nervous affections, giving a vigorous tone of body even in extreme old age. The French in Canada use this root for curing the asthma, and as a stomachic. After all, our physicians say, that we have no proofs of the efficacy of Ginseng in Europe, and that from its sensible qualities it seems to possess very little power as a medicine. The hardy species thrive well in light rich soil; the others grow in loam and peat, and are increased by cuttings in sand under a hand-glass.

2167. *Ficus*. It is not known what the derivation of this word is; but in most languages it is nearly the same. In Greek it is *oxyx*, in Latin *Ficus*, in Celtic *Figuezen*, in Teutonic *Feige*, in Slavonic *fige*, in Hungarian *fige*, in Anglo-Saxon *fic*. The species are trees or shrubs, abounding in a milky juice. The fruit is turinate, fleshy, soft, and hollow within. All the species are natives of warm countries. *F. Carica*, *le figuier*, Fr., *Feigenbaum*, Ger., and *Fico*, Ital., is supposed to be originally from Caria, in Asia, though it is now acclimatized, and in some respects naturalized in the Levant and

History, Use, Propagation, Culture,

the south of Europe. In these countries the fruit green and dried forms an important part of the food of the inhabitants. In this country it is cultivated as a fruit tree, but not generally or extensively. It is only in very warm situations that it will ripen its fruit in the open air, even though trained against a wall; though there are one or two exceptions in Sussex on the sea-coast, where it ripens its fruit on standards. The only certain mode, however, is to grow it in houses built on purpose. No tree is more robust or more prolific. Even plants in pots or tubs kept in a temperature adapted for the orange-tree will fruit freely, and ripen two crops a year. Kept in the temperature of the pine-apple, Mr. Knight has proved, that the fig will go on growing and ripening fruit without intermission. A variety of curious and important matter respecting this tree will be found in the Transactions of the Horticultural Society, and in the Encyclo-

CLASS XXIV. — CRYPTOGRAMIA.

Sexual organs hidden; either imperfect, or not existing.

This class differs essentially from all the preceding in the peculiar conformation of the organs of reproduction, which are not formed of male and female parts, like those of the higher classes of plants, but are of a nature altogether different, consisting either of buds under a particular form, or of vessels containing vegetable substances analogous to seeds, but differing in not being the result of impregnation, and in having the power of striking root indifferently from any point of their surface. The internal composition of these vegetable substances, which are denominated sporules, is, on account of their extreme minuteness, unknown. Willdenow describes Cryptogamous plants to be vegetables without any visible flower, and differing from other plants in their external characters, in which respect they also differ from each other. By more modern botanists they are said to be distinguished from other plants by the absence of lymphatic vessels, and of pores of the epidermis; but the latter character has been disputed, and neither apply to the three first orders of Cryptogamia. For the purposes of this work, which follows the system of Linnæus, the definition, if it can be so called, of Willdenow is most applicable. In the arrangement of the orders of Cryptogamia, it has been found advisable to adhere to the divisions of modern writers, who, by extensive observations, and great powers of perception, have brought this most abstruse part of botany to a considerable degree of perfection.

The orders which are here adopted, are

I. FLICES. Reproductive organs uniform. Thecæ naked, or covered by an involucre, placed on the back of a frond, which is either foliaceous, or contracted in such a way as only to cover the clusters of thecæ, and always circinate when young.

II. EQUSETACEÆ. Reproductive organs uniform, in terminal spikes, composed of peltate, several-sided scales, producing on their under surface 4-7 elongated involucre containing the seeds. Branches whorled, rigid.

III. LYCOPODIÆ. Reproductive organs axillary, sometimes apparently spiked. Thecæ? of two kinds, the one containing granules, the other larger bodies. Stems covered with many small leaves.

IV. MARSHLEACEÆ. Reproductive organs radical, uniform. Sporules? contained in roundish, one or many-celled indehiscent heads. Plants simple, aquatic.

V. MISCI. Reproductive organs of two kinds. Thecæ many-seeded, solitary, furnished with an operculum and columella. Plants leafy.

VI. HEPATICÆ. Reproductive organs of two kinds. 1st. Thecæ without an operculum, either naked or sessile, or furnished with a veil, through which they are, more or less, protruded. Sporules naked, or mixed with spiral threads. 2d. Minute, roundish, or oblong bodies variously situated. Plants frondose, of a cellular structure, not submersed.

VII. ALGÆ. Reproductive organs of two kinds. 1st. Thecæ or tubercles variously situated. 2d. Sporules or granules naked, or immersed in the frond. Plants always aquatic, and submersed.

VIII. LICHENES. Reproductive organs uniform. Sporules deposited in receptacles of various forms, distinct in substance from the thallus, which is either pulverulent, crustaceous, membranous, foliaceous, or branched and shrub-like.

IX. FUNGI. Reproductive organs uniform. Sporules arranged in tubular cells, placed in some part of the external surface. Substance various, mostly thick and fleshy, sometimes vesicular. Thallus none.

A few other divisions, such as Hypoxyla, &c., which have been proposed by some writers of authority, not having appeared to possess characters of sufficient importance, are here merged in others.

In consequence of the wide difference which exists between the lower orders of vegetables and the higher, and the impossibility of subjecting the former to cultivation, it has been found requisite, with the exception

1437 Leaves oblong acute subcordate at base netted beneath

1438 Leaves ovate unequal-sided sinuate-toothed cordate at base rough on each side

1439 Leaves opp. obovate oblong serrated acute scabrous above hairy beneath

1440 Leaves oblong acuminate blunt tapered at base netted beneath, Stipules scarious smooth

1441 Leaves ovate-oblong acute sinuate toothed smooth

and Miscellaneous Particulars.

preda of Gardening. (§ 5268.) *F. elastica* as well as some other plants produce the gum known as India-rubber.

F. indica is an immense tree, spreading very wide, the branches ash-colored, and throwing down roots into the soil. Marsden mentions one of these growing near Memgee, twenty miles west of Patna, in Bengal, which was in diameter 370 feet; the circumference of the shadow at noon was 1116 feet, and there were fifty or sixty stems. It is called the priest's tree, and held in so much veneration by the Gentoos, that if any one cuts or lops off a branch, he is looked upon with as great abhorrence as if he had broken a cow's leg. *F. religiosa* is so called, because it is sacred to the idol Vishnu. The horizontal branches root into the soil like the other, all the species are of remarkably easy culture, and root easily from large cuttings.

of Filices and their nearest allies, to introduce some alterations into the form of the pages of this work. These alterations commence with Musci.

The orders of Cryptogamia being equal in importance to the classes of flowering plants, they will be treated of as the classes have hitherto been treated. Each order will, therefore, stand by itself, and will have its genera and species arranged under it, without immediate connection with any other order.

Order I.

FILICES.

Reproductive organs uniform. Thecae naked, or having an involucre placed on the back of a frond, which is either foliaceous, or contracted so as only to cover the clusters of thecae, and always circinate when young.

This is the most beautiful of all the orders of Cryptogamic plants, and has always been a favorite tribe, to which the most celebrated botanists of all modern times have given their attention. Till some time, however, after the death of Linnæus, ferns shared the fate of all other departments of botany, being viewed rather as objects of elegant form than of scientific examination. Sir James Edward Smith was the first author who attempted to distribute them into genera, by characters derived from a minute inspection of their organs of reproduction; and his arrangement, however imperfect it may now be considered, is certainly that upon the principles of which the more precise divisions of recent authors have been effected. He was succeeded by Swartz, Willdenow, Brown, and many others, and lastly by Dr. George Frederick Kaulfuss, Professor of Botany at Halle, whose arrangement of 1824 is chiefly here adopted as being the most recent which has been published.

The principal distinction which exists between ferns and other orders of Cryptogamous plants is found in the situation of what are called their *sori*, or patches of reproductive organs, which are in all cases inserted upon the back surface of the leaf, or, as it is called in ferns, the frond, sometimes appearing only in the form of little spots, sometimes covering the whole of the under side of the frond, and sometimes contracting the substance of the frond, so as to give it the appearance of a single mass of fructification, bursting in a determinate manner, as in *Ophioglossum*, *Schizæa*, &c. Besides this character, the fronds are always rolled up in a circinate manner when they are first developed.

That part of the frond which occupies the place of the petiole of a compound leaf is called the *rachis*. The groups of thecae forming the organs of reproduction are called *sori* (a), which are either naked or covered with an involucre, or, as it is more frequently termed, *indusium*. (b) This latter organ, when present, either bursts outwardly towards the margin of the frond, or inwardly towards the midrib or rachis. It may also be either single or double; the latter term signifying, that there is a cover on each side the sorus. The bodies which are called *thecæ* by some authors, and capsules by others, are constructed in two ways; they are either surrounded

by an elastic furrowed ring, when they are called *Annulata* (c), or they are destitute of such a ring, in which case they are termed *Exannulata* (d). They contain the minute powdery matter, which is that by which ferns are reproduced; the constituent parts of this matter are called *sporules* (e), and are analogous to seeds in more perfect plants.

TRIBE I. POLYPODIACEÆ.

Thecæ 1-celled, with an articulated, elastic, longitudinal ring, bursting across in an irregular manner.

2168. *Polybotrya*. Thecæ closely covering the whole surface of the pinnules of an altered frond. Indusium none.
2169. *Acrostichum*. Thecæ scattered, occupying all the lower surface of the frond, or a part of it. Indusium none.
2170. *Hemionitis*. Thecæ seated on the reticulated veins of the frond. Indusium none.
2171. *Gymnogramma*. Thecæ seated on the forked veins of the frond. Indusium none.
2172. *Meniscium*. Sori linear, lunulate, somewhat parallel, placed across the spaces between the veins of the fronds. Indusium none.
2173. *Xiphopteris*. Sori oblong, oblique, placed on the reflexed points of the frond. Indusium none.
2174. *Celerach*. Sori linear, transverse, concealed under palææ. Indusium none.
2175. *Polypodium*. Sori in little round scattered convex spots. Indusium none.
2176. *Tarūtis*. Sorus linear, longitudinal, placed between the midrib and margin of the frond under the end. Indusium none.
2177. *Nothochlæna*. Sori almost marginal, continuous, covered by the scales, setæ, or hairs of the frond. Indusium none.
2178. *Onoclea*. Sori globose, inserted upon columnar receptacles, inclosed within the berry-like pinnules. Indusium double: common placed on the edge of the pinnule, and united into the form of a berry; proper membranous enveloping the sori.
2179. *Struthiopteris*. Sori linear, crossing, inserted upon crested receptacles, included in a double row within the somewhat articulated pinna. Indusium double: common marginal opening inwards in a rugged manner; proper membranous, and resembling a partition.
2180. *Allosorus*. Sori placed on the transverse forked veins of spike-like pinnules, finally becoming confluent. Common indusium very narrow, arising from the revolute margin which is rolled inwards.
2181. *Ellebocarpus*. Thecæ globose, irregularly attached to the longitudinal veins of the frond. Indusium transparent, discolored, arising from the revolute edge of the frond, continuous, and opening by a longitudinal suture.
2182. *Lomaria*. Sori linear, continuous, occupying the surface of the linear pinna of a particular frond. Indusium marginal or submarginal, conniving, involute.
2183. *Blechnum*. Sori linear, continuous, (sometimes interrupted) contiguous to the midrib. Indusium membranous, superficial, continuous, opening inwards.
2184. *Woodwardia*. Sori oblong, distinct, in rows, parallel, contiguous to the midrib. Indusium membranous, superficial, vaulted, opening inwards.
2185. *Doodia*. Sori lunulate, distinct, parallel with the midrib. Indusium membranous, superficial, flat, separating inwardly.
2186. *Asplenium*. Sori linear, placed upon lateral veins. Indusium membranous, flat, separating inwardly.
2187. *Allantodia*. Sori oblong, oblique with respect to the midrib. Indusium membranous, vaulted, cylindrical, adhering to a vein, opening inwards, finally spreading outwards.
2188. *Scolopendrium*. Sori linear, oblique, opposite, double, parallel. Indusia membranous, opening in opposite pairs.
2189. *Diplazium*. Sori linear, double alongside the veins. Indusia double, narrow, placed between the sori, fixed lengthwise by the middle, with their exterior margin separate.
2190. *Pteris*. Sori continuous, linear, marginal. Indusium from the inflexed edge of the frond, opening inwards.

POLYPODIACEÆ.

2168. POLYBOTRYA. *H. & B.* POLYBOTRYA. Sp. 1—17.

History, Use, Propagation, Culture.

2168. *Polybotrya*. So called in allusion to the numerous bunches of the fertile divisions of its frond; from *poly*, many, and *botrys*, a bunch. Handsome species of West Indian and South American ferns. The genera of ferns are not very dissimilar in habit, so that it will be seldom that any remarks upon that subject will be found in these notes, which must necessarily consist chiefly of the etymology of the names. The medical properties are probably the same in all the genera; such as appear of any consequence are, however, inserted in the proper places. We will here take occasion to remark, that the cultivation of ferns is nearly the same in all cases, and that the soil best adapted for their growth is light peaty earth with a little loam. They are propagated by division of the roots, or by seeds or sporules. The latter plan has been practised at Liverpool,

2191. *Vittaria*. Sori solitary, continuous, linear, marginal or submarginal, immersed. Indusium double, superficial.
2192. *Lonchitis*. Sori lunate, marginal, placed under the recesses of the frond. Indusium from the margin of the frond, inflexed, opening inwards.
2193. *Antrophyum*. Sori linear, continuous, immersed in the reticulated veins of the frond. Indusium double, opening in the middle.
2194. *Adiantum*. Sori inserted into the indusium, linear, contiguous, or roundish. Indusium marginal, opening inwards, either nearly continuous, or squamiform, or reniform.
2195. *Chrotanthus*. Sori dot-like, separate, marginal in the recess of the indusium. Indusium either reflexed crenules of the frond, or squamiform, membranous, and arising from the margin, or nearly continuous, opening inwards.
2196. *Davallia*. Sori roundish, nearly terminal and marginal, distinct. Indusium superficial, attached inwards, and opening outwards.
2197. *Dicksonia*. Sori dot-like, marginal, solitary in the recesses of the frond. Indusium membranous, nearly globose, marginal, adnate, opening unequally with lacerated orifices, and spreading back in all directions.
2198. *Balanium*. Sori oblong-linear, nearly terminal and marginal, transverse. Indusium coriaceous, reniform, 2-valved, opening outwards: upper valve marginal, patera-shaped; lower nearly flat.
2199. *Aspidium*. Sori roundish, scattered. Indusium solitary, orbicular, peltate, or reniform.
2200. *Woodisia*. Sori dot-like, scattered. Indusium membranous, placed under the sori, somewhat patera-shaped and ciliated.
2201. *Cyathea*. Sori globose, scattered, inserted upon an elevated receptacle, which arises from a division of the vein. Indusium spherical, opening in the middle, and finally becoming patera-shaped.
2202. *Trichomanes*. Sori marginal, inserted upon a long setaceous receptacle. Indusium erect, campanulate.
2203. *Hymenophyllum*. Sori marginal, inserted upon a claviform receptacle. Indusium erect, 2-valved.

TRIBE II. OSMUNDACEÆ.

Thecæ without a ring, netted, pellucid, with radiating striæ upon their top, bursting lengthwise on one side.

2204. *Todea*. Sori oblong, seated upon forked veins of an unchanged frond. Thecæ globose, stalked, netted, opening from their base as high as a pellucid dorsal projection. Indusium none.
2205. *Osmunda*. Sori nearly globose, alternately arising from the margin of a frond, which becomes changed into a panicle. Thecæ globose, stalked, netted, opening from their base as high as a pellucid dorsal projection. Indusium none.
2206. *Lygodium*. Thecæ oblong-ovate, striated at the end in a radiate manner, seated in two rows upon 1-sided marginal spikelets, fixed by their backs and opening lengthwise in front. Indusium funnel-shaped, covering up each capsule.
2207. *Anemia*. Thecæ ovate, striated at the top in a radiated manner, disposed in compound unilateral spikes, attached by the base, and opening lengthwise. Indusium none.

TRIBE III. OPHIOGLOSSEÆ.

Thecæ 1-celled, adnate at base, roundish, coriaceous, opaque, without a ring, not vascular, sometimes fastened together, half-bivalved.

2208. *Botrychium*. Thecæ naked, globose, distinct, attached to the rachis of a compound spike, half 2-valved, opening nearly at one side.
2209. *Ophioglossum*. Thecæ naked, connate in a distichous jointed spike, half 2-valved, opening at the side.
2210. *Marattia*. Sori oval, somewhat marginal. Thecæ united in a double row, opening inwards by a cleft. Indusium arched, opening lengthwise above, 2-valved, inclosing on each side a row of thecæ.

POLYPODIACEÆ.

1442 Ster. fronds pinnat. Pinn. ov. lanc. ent. margin. Fert. fr. bipinn. Pinnæ lin. Pinnul. obl. flatt. runn. together

and Miscellaneous Particulars.

by Mr. H. Shepherd, with so much success, that his method has been made the subject of a communication to the Horticultural Society, of which the following is an extract. "Having provided a common garden-pot four and a half inches in depth, and three and a half wide, let the bottom part, to the height of one inch, be filled with fragments of broken pots, by way of drain. Over these should be spread a stratum of such soil as is commonly used for potting greenhouse plants, of the depth of two inches; the remaining inch and half should be filled with brown loamy earth sifted through a hair-sieve, the surface being made perfectly smooth, and on this the seeds are to be scattered as evenly as possible. Care must be taken that the wind be not suffered to blow the seeds away, leaving nothing but empty capsules. The seeds being sown, no other covering is

History, Use, Propagation, Culture,

required than a bell-glass, which should just fit within the rim of the pot, so as to exclude all air. The pot is then to be kept in a pan always half full of water, and set in a shady part of the stove or hot-house, being always regularly watered as above directed. When the young plants have acquired their second leaf, it is proper to give them a little air, by placing a small piece of wood under the edge of the glass, at one side. In a short time afterwards the glass may entirely be removed."

The vegetation of ferns appears to be less tardy than botanists have supposed. Specimens of *Gymnogramma tartareum* having been brought from Jamaica to Liverpool, on the tenth of July 1817, a few seeds were brushed off them and sown immediately. Several plants thus obtained perfected seeds by the fifth of August 1818, which being committed to the earth, had produced young plants, covering the surface like a fine moss, by the eighth of September following. Specimens of *Pteris cretica*, and another marked *Pteris acrostichoides*, from William Jackson Hooker, Esq., afforded seeds which have vegetated and produced very fine plants of both species. Dr. William Carey sent from Serampore specimens of *Polypodium giganteum*, and what appears to be a new *Diplazium*. These reached Liverpool, July the tenth 1818; their seeds being immediately sown, had produced young plants by the eighth of September. A small fern from Sicily, with several others of this tribe, collected in the Brazils by William Swainson, Jun., Esq., afforded ripe seeds, which being sown in the spring of 1818, had partly vegetated, and in September had produced *Polypodium decumanum*, as well as *Gymnogramma calomelanos*. Mr. Shepherd obtained two plants of the latter from seeds brushed from the specimens in the Herbarium of Dr. John Reinhold Forster, now belonging to the botanic garden at Liverpool, and perhaps fifty years old. He made the experiments on other ferns in that collection, but without success, which, indeed, is not wonderful.

The seeds of this order of plants are of course liable to damage from damp or other accidents, like those of plants in general. It seems, moreover, that they are very soon shed by the bursting of their capsules, so that

- 1443 Fronds lanceolate tapered each way smooth : fertile linear lanceolate, Stalks very short naked
 1444 Fronds elliptical obtuse at each end hairy villous at the edges, Stalk villous
 1445 Ster. fronds renif. somew. lobed entire horizontal : fert. erect palmate dichotom. bearing fr. on lanc. segm.
 1446 Fronds pinnated : pinn. lanc. acumin. serr. cuneate at base, Fert. pinn. : pinn. linear entire, Stem climbing
 1447 Fronds pinnated : pinn. altern. obl. lanceolate ent. cuneate and equal at base, all acum. : the upper fertile
 1448 Fronds cordate 5-lobed toothed ciliated, Stalk long
 1449 Fronds pinnate : pinnæ pinnatifid acuminate hairy
 1450 Fronds pinnate : pinnæ oblong acutish subcordate subserrate on each side as well as the stalk hairy
 1451 Fronds pinnate : pinnæ ternate in pairs and solitary stalked lin. crenul. ; fertile yellow with meal beneath
 1452 Fronds bipinnate : pinnulæ pinnatifid ; segm. cuneate truncate at end toothletted yell. with meal beneath
 1453 Fronds bipinnate : upper pinn. confluent obl. obt. serrul. ; lower somew. pinnatif. white with meal beneath
 1454 Fronds bipinnate : pinn. lanc. white with meal beneath ; lower pinnatifid auricled at base, upper confluent
 1455 Fronds pinn. : pinn. lanc. acuminate cuneate at base all repand : lower opposite, Stem none
 1456 Fronds linear toothed when fructifying entire at the end, Stem filiform ascending simple
 1457 Fronds pinnatifid : segm. oblong obtuse chaffy with entire palææ beneath

- 1458 Fronds hairy : sterile oblong ovate entire ; fertile lanceolate, Sori solit. Stem filiform rooting chaffy
 1459 Fronds lanceolate entire smooth, Sori solitary, Stem filiform creeping with bristly palææ
 1460 Fronds lanceolate margined acute tapered at base smooth, Sori in two rows
 1461 Fronds oblong obtuse entire smooth above rusty with down beneath, Sori contiguous copious
 1462 Fronds deeply pinnatifid glaucous : segm. lanc. acuminate entire, Lower sori scattered ; upper solitary
 1463 Fronds deeply pinnatifid : segm. lin. lanc. blunt crenul. contig. : upper smaller by degrees, Sori solitary
 1464 Fronds deeply pinnatifid : segm. lanc. blunt entire contig. ; upp. smaller by degrees, Sori solit. Stalk naked
 1465 Fronds deeply pinnatifid : segm. lanc. acute entire parallel smooth ; upper and lower smallest, Sori solitary
 1466 Fronds pinnatifid hairy : segments half ovate blunt, Sori solitary
 1467 Fronds deeply pinnatifid : segm. altern. lin. ent. obt. ; upper smaller by degrees ben. as well as stalk chaffy
 1468 Fronds bipinnatif. : 2 lower pinnæ defl. ; segm. lin. lanc. blunt ent. ciliat. Veins hairy, Sori solit. marginal
 1469 Fronds downy and ciliated bipinnatifid, Membranes connecting the opposite pinnæ oblong hexagonal
 1470 Fronds 4-pinn. Branches and branchlets lanc. Pinnæ lanc. pinnatifid, Segm. ovate acute glaucous beneath
 1471 Fronds 3-pinn. : pinnulæ pinnatif. ; segm. lin. serrat. acute, Rachis entire naked, Sori solit. Stalk smooth
 1472 Fronds ternate bipinnate spreading deflexed : segments blunt nearly entire, Sori marginal, Root filiform
 1473 Fronds ternate bipinnate straight rigid : segments bluntish nearly entire, Sori marginal confluent
 1474 Fronds oblong smooth entire margined acute at each end, Sori in rows

and Miscellaneous Particulars.

they are more likely to be found in such specimens as are just beginning to turn brown in their fructification, than in others more advanced.

2169. *Acrostichum*. Said to be formed from the words *ακρος* *ειρος*, the commencement of a verse, and to have been so called because the reverse of their leaves indicates traces of lines, resembling the beginning of lines of poetry. These are fine, chiefly tropical, ferns, one of which, *A. aureum*, sometimes grows to the height of five or six feet.

2170. *Hemionitis*. Said by Dioscorides to be so called from the resemblance of its nature to that of a mule, *ἡμιονος* ; it was always considered sterile, bearing neither flowers nor fruit.

2171. *Gymnogramma*. Named by Desvaux from *γυμνος*, naked, and *γραμμα*, writing, in allusion to the disposition of the naked sori upon the forked veins of the frond, whence they seem to resemble Roman letters. The species have been separated from *Hemionitis* and *Acrostichum*.

2172. *Menisium*. From *μηνος*, the moon ; the sori are crescent-shaped. These ferns are remarkable for the arrangement of their veins. The little veins which unite the transverse veins of the sterile frond are usually at right angles, and generally united with each other by a little branch which sets off from one or other of their angles. In the fertile fronds the veins on which the sori are placed are either curved or straight.

2173. *Xiphopteris*. Divided from *Grammitis* by Kauttius, who seems to have named it from *ξίφος*, a sword, and *πτερίς*, a fern, on account of the sword-like form of their fronds.

2174. *Ceterach*. The name employed by the Arabian and Persian physicians for this plant was *Chetherach*. (*Gazoph. Ling. Pers. p. 377.*) They employed the plant in obstructions of the viscera, for the jaundice, and for disorders of the spleen.

2175. *Polypodium*. From *πολυς*, many, and *πυς* *ποδος*, a foot, on account of the multitude of the roots which form close entangled patches. Many of the species of this genus are noble plants. They are mostly epiphytic

History, Use, Propagation, Culture,

upon trees. Polypodium vulgare is sometimes burnt for the sake of its ashes, which contain a large proportion of carbonate of potash, which is employed in the fusion of flint for some kinds of glass-ware.

2176. *Tenitis*. From the resemblance of the interrupted line of sori to the *taenia* or tape-worm.
 2177. *Nothochlæna*. From *νοθος*, spurious, and *χλαίνα*, a cloak. So called because the sori are not enclosed in a genuine indusium, but are frequently covered over by the palææ of the frond. A genus extracted by Mr. Robert Brown from the ancient *Acrostichum*.

2178. *Onoclea*. A name given by Dioscorides, Pliny, and Galen, to a Boragineous plant, and strangely applied by the moderns to a genus of ferns. *O. sensibilis* has been so called from the delicacy of its frond, which is so impatient of injury as to perish with almost the least violence.

2179. *Struthiopteris*. Named from *στρουθιος*, an ostrich, and *πτερις*, a fern, on account of the similarity between its fine fronds and the feathers of an ostrich. A genus divided from *Osmunda* by Willdenow.

2180. *Allosorus*. From *αλλος*, various, and *sorus*; a name contrived by Bernharti, in a paper printed in Schrader's Journal, we presume in allusion to the different states of the sori at different periods. A curious little rock plant.

2181. *Ellobocarpus*. Named by Kaulfuss, from *ελλωβος*, enclosed in a ped, and *καρπος*, fruit, in allusion to the pod-like form of the divisions of the fronds on which the sori are placed.

- 14475 Fronds deeply pinnatifid glaucous : segments lanceolate acuminate repand serrate, Sori in rows
 14476 Fronds pinnate, Leaflets lanceolate acuminate repand wavy distant
 14477 Fronds lanceolate entire smooth or somewhat scaly rigid erect, Sori solitary
 14478 Fronds simple 3-lobed and pinnatifid : segments lanceolate acuminate opposite, Sori scattered immersed
 14479 Sterile fronds sessile ovate sinuated : fertile pinnatifid ; segments lanceolate
 14480 Fronds on a creeping stem lanceolate acuminate entire subulcid with flexuous veins, Sori scattered
 14481 Sterile fronds oblong entire : fertile linear lanceolate repand, Sori solitary, Stem paleaceous rooting
 14482 Fronds linear lanceolate much tapered at the base somewhat repand quite smooth, Sori scattered
 14483 Ster. fronds obl. lanc. taper, at base : fert. lin.-lanc. bear. sori on upp. half, Sori oval immers. in dense wool
 14484 Fronds pinnate, Pinn. somewhat stalked oblong acuminate coarsely and bluntly serrated, Sori in rows

14485 Fronds simple lanceolate acute at each end nearly entire fructifying at end

14486 Fronds bipinnate woolly : pinnules elliptical-obtuse covered all over with long wool

14487 Pinnæ lanceolate acute cut toothed : pinnules and rachis smooth

14488 Pinnæ pinnatifid with rounded lobes : pinnules villous, Rachis scaly

14489 Sterile fronds bipinnatifid : segments entire acute equal

14490 Sterile fronds bipinnatifid : segments entire obtuse ; lower long acute

14491 Fronds supradecomposed, Pinnæ alternate roundish cut

14492 Alternate pinnæ pinnulate on the upper-side linear : lower 2-parted

14493 Sterile pinnæ long-lanceolate acuminate cuneate at base repand-toothed : fertile linear

14494 Fronds pinnated smooth, Pinnæ linear bluntish entire nearly equal at base

14495 Fronds pinnated, Pinnæ linear-lanceolate mucronate auricled at base scabrous at edge

14496 Fronds pinnated, Lower pinnæ opposite lanceolate entire subcordate at base : upper alternate united

14497 Fronds pinnate-pinnatifid : segments lanceolate acuminate somewhat repand finely serrulate

14498 Fronds very smooth pinnate, Pinnæ sessile lanceolate pinnatifid, Segments oblong blunt crenulate

14499 Fronds lanceolate pinnatifid : segm. linear ensiform acuminate spinulose, Sori lanceolate in two rows

14500 Fronds pinn. : pinnæ cordate pinnatifid ; segm. ovate rather acute, lower and terminal usually 3-lobed

14501 Fronds bipinn. : pinnules obl. lanc. cut serrated : serratures 2 or 3-toothed nearly acute, Sori obl. straight

14502 Fronds bipinn. : pinnæ obl. lanc. acute ; pinnules oblong pinnatifid cut, Sori becoming confluent

14503 Fronds bipinn. : pinnules pinnatifid ; segments 3 or 2-toothed

14504 Fronds bipinn. : pinnules obovate blunt cuneate at base acutely toothed at end, Sori becoming confluent

14505 Fronds bipinn. : pinnules oblong acute at each end serrated at end : upper confluent

14506 Fronds alternately decomposed : pinnæ rhomboid cuneiform spreading bitten at end

and Miscellaneous Particulars.

2182. *Lomaria*. From *λωμα*, an edge, on account of the marginal position of the indusia. These are fine plants, resembling *Acrostichum* in habit.

2183. *Blechnum*. One of the Greek names of the fern was *βλαχρον*. Athenæus writes it *βλαχρον*, and derives it from *βλαξ*, powerless, insipid.

2184. *Woodwardia*. Named by Sir James Smith, after his friend Thomas Jenkinson Woodward, Esq., a good practical English botanist. One of the species produces little hairy bulbs at the axilla of the leaves, which either fall off and strike root in the ground, or vegetate while attached to the parent plant. This property is common to many other ferns, and in one instance, the young plants so produced have been mistaken in *Pteris cornuta* for parasites by an acute cryptogamic botanist.

2185. *Doodia*. So called in honor of Samuel Dood, a London apothecary, who was almost the first investigator of British cryptogamic plants. Small rough-leaved ferns of rigid texture.

2186. *Asplenium*. From *α*, privative, and *σπλην*, the spleen. This plant was formerly held to be a sovereign remedy for all diseases of this organ, and to be so powerful as even to destroy it if employed in excess.

History, Use, Propagation, Culture,

2187. *Allantodia*. So named from *αλλαντος*, a sausage, or sort of small pudding, to which the cylindrical arched indusia bear considerable resemblance.

2188. *Scelopendrium*. On the lower surface of the fronds of this plant are to be seen little marks which bear a likeness to the insect called Scelopendra. It is probable that the supposed varieties of this plant are distinct species. One of them has been ascertained not to alter in being raised from seed.

2189. *Diplazium*. From *διπλως*, double; the indusia are double. Handsome ferns of large size; one forms a small tree.

2190. *Pteris*. The Greeks called ferns in general by this name, because they generally resemble plumes, *πτερος*, in their light and divided appearance. *Pteris aquilina* is the common brake, well known as an excellent covert for game, and for serving for many household purposes in the north of England. It is used as litter for

- 14507 Fronds pinnated: pinnae cuneate ovate acute deeply pinnatifid; segments lanc. cuneate unequally toothed
 14508 Fronds pinnated: pinnae stalked oblong acuminate pinnatifid; segm. obt. obt. sharply serrat. Sori parallel
 14509 Fronds pinnated: pinnae ovate repand somewhat auricled; term. remote small entire, Fronds rooting at end
 14510 Fronds pinnated: pinnae alternate elliptical roundish crenate, Rachis flattened beneath
 14511 Fronds pinnated: pinnae roundish blunt crenate cuneate at base, Stalk discolored
 14512 Fronds pinnated: pinnae ovate-roundish crenate, Rachis shining keeled beneath
 14513 Fronds pinnated: pinnae alternate cuneiform erect eroded at end
 14514 Fronds pinnated: pinnae sessile lanceolate serrulate cordate at base auricled upwards
 14515 Fronds pinnated: pinnae lanceolate blunt equally and bluntly serrated, Sorus one on each pinna
 14516 Fronds broad-lanceolate subsessile, Sori very near parallel contiguous to the midrib
 14517 Fronds pinnated: pinnae ovate oblique serrated obtuse unequal at base cuneate
 14518 Fronds pinnat.: pinnae altern.; upp. usually opp. lin.-lanc. subrepand truncate at base above rounded below
 14519 Fronds pinnated trifid: pinnae alternate linear torn at end
 14520 Fronds lanceol. stalked rather crenate auricled cordate at base at the end very long linear-filiform rooting
 14521 Fronds lanceolate on short stalks acuminate serrated tapered at base and entire, Sori contiguous parallel
 14522 Fronds pinnate: pinnae lanceolate taper-pointed at end pinnatifid; segments bifid, Stalk shining glabrous
 14523 Fronds ternate: middle leaflet pinnatifid; lateral 3-parted toothed
 14524 Fronds pinnated: pinnae obl. lanceolate acuminate coriaceous serrated at end tapered at base, Stalk chaffy
 14525 Fronds 3 pinnated: pinnae oblong lanceolate with very long points, Sori becoming confluent
 14526 Frond 5-lobed cordate, Three middle lobes acuminate

- 14527 Fronds bipinnate: pinnules oblong pinnatifid; segments lanceolate finely bidentate, Sorus scit. at base
 14528 Fronds 3-pinnate: pinnules lanceolate decurrent cut serrated, Sori contiguous finally becoming confluent

14529 Frond simple cordate-lingulate smooth beneath

- 14530 Fronds pinnat.: pinnae lanc. serrat. at end truncate at base above rounded and somew. wedge-shaped below
 14531 Fronds pinnat.: pinnae lanc. coarsely toothed; teeth rounded serrated at end tapered and finely toothed

- 14532 Fronds pinnated: pinnae linear auricled cordate at base serrulate, Stalk and rachis paleaceous hairy
 14533 Fronds pinnated: pinnae oblong lanceol. on short stalks entire cuneate at base, Stalk and rachis smooth
 14534 Fronds pinnated: pinnae lin. decurrent; lower 3-parted, Sterile acutely serrated: fertile ent. serrat. at end
 14535 Fronds decomposed: lower bipinnate; pinnules lanceol. retuse at base, terminal longer, Stalk pubescent
 14536 Fronds bipinnatifid, Lower branches twin 2-partite below, Pinnules lanceolate subfalcate sharply serrated
 14537 Fronds supradecomposed: pinnae broad-lanceolate pinnatifid, Stem and branches prickly
 14538 Fronds tripinnate: pinnules linear decurrent downy beneath; those at the end longest, Rachis smooth
 14539 Frond 3-parted, Branches bipinnate, Pinnules linear elongated blunt entire: lower bipinnatifid
 14540 Frond 3-parted, Branches bipinn. Pinnules lin. lanc.: upper undivided; lower pinnatif. Segm. obl. blunt
 14541 Frond pedate, Branches pinnate, Pinnules obl. lanceolate acumin. pinnatifid, Segm. oblong acute serrated
 14542 Fronds pinnat.: pinnae lanc. acum. on short stalks tapered and serrated at base; lowest 2-parted or ternate
 14543 Fronds bipinn.: pinnules somew. stalked ovate-lanc. blunt crenulate; lower hastate 3-lobed, Stalk smooth
 14544 Fronds deeply 5-lobed palmate, Lobes pinnatifid: segments linear lanceolate acumin. Recesses rounded
 14545 Fronds deeply 5-lobed palmate, Lobes pinnatifid: segments linear lanceolate acute, Recesses acute
 14546 Pinnae opposite pinnatifid, Nerve above a little strigose, Pinnules lanceolate blunt entire, Pectiole smooth

14547 Fronds linear very long pendulous, Sori solitary within the margin

14548 Fronds bipinnate hairy: pinnae pinnatifid acuminate; segments blunt, Stalk and rachis villous

14549 Fronds linear-lanceolate tapered at each end ribbed, Sori reticulated

and Miscellaneous Particulars.

cattle, and very frequently for the purpose of thatching cottages. The ashes are employed in the manufactory of soap and glass. Its astringent quality has recommended it in dressing and preparing kid or chamois leather. The country people take it medicinally to destroy worms, and a bed made of the green plant is esteemed a sovereign cure for the rickets in children.

2191. *Fittaria*. From *vitta*, a ribband, on account of the narrow ribband-like appearance of the fronds. Small simple-leaved grass-like plants, of difficult cultivation.

2192. *Louchitis*. From *λοχίτις*, a lance, on account of the form of the fronds of some species. The Greeks had a plant named *λοχίτις*, but it must have been very different from that of the moderns.

2193. *Anthrophyum*. A genus divided by Kaulfus from *Hemionitis*, and named from *αντροφύω*, a cavern, and *φύω*, to grow, in reference to its native places of habitation.

History, Use, Propagation, Culture,

2194. *Adiantum*. From *adivavros*, dry. In vain you plunge the *Adiantum* in water, says Pliny, it always remains dry. The prettiest of all ferns, on account of the delicate slender stalks on which the pinnules are balanced in the air; one species on this account is called *Capillus Veneris*, or in English, Maiden's Hair.

2195. *Cheilanthes*. From *cheilos*, a lip, and *antos*, a flower, in allusion to the lip-like form of the indusium. Pretty plants, formerly referred to *Pteris*.

2196. *Davallia*. Named by Sir James Smith, after his friend M. Davall, a Swiss botanist, who sent him large collections of plants. *D. canariensis* is popularly called the hare's-foot fern, on account of the peculiar form of its rootstock, which curves over the side of the pot in which it grows, and, being covered with close brown hairs, resembles very perfectly the foot of a hare.

2197. *Dicksonia*. In honor of the late Mr. James Dickson, a celebrated British cryptogamic botanist. A noble genus containing several arborescent species, among which the tree-fern of St. Helena is placed. This plant is often brought in a living state to this country, but the mode of cultivating it being unknown, it rarely survives more than a few months.

2198. *Balantium*. A genus of Madeira ferns, divided from *Dicksonia* by Kaulfuss, on account of its transverse two-valved indusium; and named from *balantion*, a purse, on account of the form of the indusium.

- 14550 Fronds simple reniform-orbicular crenate, Both diameters equal
 14551 Frond digitate, Branches pinnate, Pinna linear-oblong obtuse nearly halved crenate, Stalk smooth
 14552 Fronds bipinnate: pinnae ovate acuminate cuneate at base toothed at end, Sori continuous upon each edge
 14553 Frond pedate, Leaflets pinnate, Pinnae rhomboid-oblong somewhat lunate cut-lobed
 14554 Fronds bipinnate: pinnules trapezoid-obl. blunt, Sori oblong at the end of the upper edge, Stalk villous
 14555 Fronds bipinnate: pinnules rhomboid oval serrated at end, Sorus lin. solitary on upper edge, Stalk hairy
 14556 Fronds supradecomp.: pinnules trapezoid acum. cut crenate towards end of upper edge, Sori on crenatures
 14557 Frond alternately decomposed: pinnules stalked cuneiform lobed
 14558 Fronds supradecompound: pinnules rhomboid blunt cut lobed on upper edge, Lobes toothl. bearing sori
 14559 Fronds pinn. or bipinn.: pinnae obl. lanc. halved truncate at base serrul. Sori on upper edge, Stalk smooth
- 14560 Fronds bipinnate, Lower pinna bipinnate: pinnules ovate-ellipt. obtuse obsoletely subcordate crenulate
 14561 Fronds bipinn. hairy on each side: pinnules pinnatif. ; segments obl. blunt entire, Stalk and rachis hairy
 14562 Fronds bipinnate smooth: pinnules obl. lanc. obtuse pinnatifid cut; segments subbifid, Stalk paleaceous
 14563 Fronds tripinnate somewhat villous, Leaflets orbicular very small

- 14564 Fronds bipinnate alternate, Leaflets lanceolate pinnatifid, Sori linear oblong
 14565 Fronds 3-parted alternately decomposed: segments lanceolate; those bearing sori obovate

- 14566 Fronds supradecompound villous, Leaflets nearly entire, Stem arborescent
 14567 Fronds tripinnate: pinnae tapered; pinnules oblong blunt pinnatifid, Segments blunt toothed
 14568 Fronds bipinnate: pinnae pinnatifid; segments toothed, Rachis somewhat hairy

- 14569 Fronds tripinnate smooth: pinnules ovate oblong cuneate cut-toothed

- 14570 Fronds pinnate: pinnae ovate-oblong pinnatifid; segments oblong blunt toothletted
 14571 Fronds pinnate remotish: pinnules oblong serrated bulb-bearing beneath; lower pinnatifid
 14572 Fronds bipinnate: pinnules oblong blunt cut-serrated, Serratures blunt toothletted, Rachis winged
 14573 Fronds bipinn.: pinnules ov. obl. lobed pinnatif. ; segm. linear-oblong blunt nearly entire, Rachis winged
 14574 Fronds bipinn.: pinnules lanceolate acuminate pinnatifid; segments linear acute serrated, Rachis winged
 14575 Frond lanceolate pinnate: pinnae deeply pinnatifid cut toothed, Rachis quadrangular, Sori lateral
 14576 Fronds tripinnate: pinnules pinnatifid; segments linear toothed at end
 14577 Fronds simple cordate 3-lobed or ternate: middle larger; lateral auricled at base
 14578 Fronds pinnate: pinnae ciliate serrate, Stalk strigose
 14579 Fronds pinnate: pinnae falcate lanceolate serrate truncate at base auricled above [marginal
 14580 Fronds pinn.: pinnae lanc. subfalcate cordate at base gibb. and somew. serrul. on upper edge, Sori solitary
 14581 Fronds pinnate: pinnae ensiform serrated, Serratures half ovate ovate nerved
 14582 Fronds pinn.: pinnae ensiform attenuated at end downy ben. cut. pinnatif. Sori almost marginal contiguous
 14583 Fronds pinn.: pinnae pinnatif. ; segm. lanc. ac. Lowest of last pinna longest pinnatif. cut, Veins hairy ben.
 14584 Pinnae pinnatifid somewhat linear; pinnules oblong nearly entire, Sori in rows near the edge of pinnae
 14585 Fronds pinnate: pinnae lanceolate glabrous resinous glandulose beneath pinnatifid; the segm. lanceolate obtuse entire, lowermost ones longer, Sori marginal
 14586 Fronds pinn.: pinnae lin.-lanc. pinnatif. glab.: segm. ov. ac. ent. Sori marginal contigu. at length confluent
 14587 Fronds pinnate: pinnae subcordate oblong pinnatifid; segments oblong obtuse dentato-serr. Stalk chaffy
 14588 Fronds bipinnate: pinnules rigid ovate subulate acum. aristate oblique and cuneate at base and recurv.; the margins faintly serrated spinulose with a tooth near the base on upper side, Stalk and rachis chaffy
 14589 Fronds bipinnate: pinnules oblong obtuse decurrent crenate. Crenatures of base deepest, Sori marginal
 14590 Fronds bipinn.: pinnules obl. obl. serrat. mutic. Sori near the central nerve, Stalk and rachis chaffy
 14591 Fronds bipinnate: pinnules scarcely rigid ovate rather obt. aristate truncate at base which has a lobe on the upper margin shortly petiolate; the margin deeply serrated and spinulose, Stalk and rachis chaffy

and Miscellaneous Particulars.

2199. *Aspidium*. From *ææsis*, a little buckler, on account of the form of the indusia. *Fougère*, Fr., *Johannis wurzel*, Ger., *Feli Maschia*, Ital., and *Polypodio Helecho Masculino*, Span. The male fern is common to Europe, in shady places and woods. The root consists of many matted fibres, forming a turly or capitate head, of the thickness of the finger, blackish and scaly. It has been celebrated from time immemorial as a specific for worms. It appears to have been used as such by Theophrastus, Dioscorides, and Galen; but seems to have been neglected by the moderns, with the exception of empiric practitioners, until the publication of Madame Nufer's specific for the tape-worm by the French government again brought it into notice. According to her plan of administering it, from one to three drachms of the powdered root were directed to be taken in a large cupful of water in the morning, while the patient was in bed; and two hours afterwards, a strong cathartic of calomel and gamboge, proportioned to the age and strength of the patient, was given; and if necessary, the further operation was promoted by a dose of purging salts; nothing but broth being taken till the worms came away. If this, however, did not happen on the same day, the process was ordered to be repeated on the next day. In the present state of medical science, oil of turpentine is considered a certain specific for expelling tænia. (*Thom. Lond. Disp.* 186.)

Aspidium Barometz is the famous Scythian lamb, of which so many fables have been related. Although it

History, Use, Propagation, Culture

is often brought in a fresh state to the markets of Macao, as an article of medicine, no plants have ever reached this country alive. Its name has arisen from the resemblance which its brown hairy rootstalk bears to a little rufous dog couching; and the belief in its animal nature has been confirmed by the color of the juice, which is of a rich blood color, and soon becoming thick by exposure to the air. It is needless to add, that the stories about no plant being able to grow near it are mere fables. Kempfer says, that *borannek* is the name which the people on the borders of the Caspian Sea give to a kind of sheep of that country.

2200. *Woodsia*. Small ferns formerly referred to *Polyopodium*, *Aspidium*, and *Nephrodium*, by various writers; and distinguished from all these by Mr. Brown, who named the genus after Mr. Joseph Woods, an ingenious British botanist.

2201. *Cyathea*. From *κυματος*, a cup; on account of the cup-shaped form of the indusia. A fine tropical genus of ferns, which does not appear to have been well understood by its author, who confounds it with little British plants referred by all other botanists to *Aspidium*. Nearly all the species are arborescent, and arrive at the greatest height of which ferns are susceptible. *C. glauca* forms a lofty tree in the Island of Bourbon, and *C. speciosa* and *exelsa* are not less than twenty-four feet in height.

2202. *Trichomanes*. From *τριχωνος*, hair, and *μανια*, excess. The Greeks gave this name to the plant now called *Asplenium trichomanoides*, on account of its fine shining stems, which resemble hairs. Elegant plants with almost transparent foliage.

14392 Frond somew. bipinn. : pinnules decurrent ellipt. pinnatifid serrul. spiny, Rachis smooth, Nerves flexuose
 14393 Fronds bipinnate : pinnules oblong distinct inciso-pinnatifid ; segments mucronato-serrate, Stalk chaffy
 14394 Fronds bipinnate : pinnae pinnated bipinnatifid below ; pinnules lanc. blunt, Segments ovate toothletted
 14395 Fronds 3-pinnate : pinnules oblong blunt hairy above, toothed, Stalk and rachis bristly chaffy
 14396 Fronds pinnate : pinnae lanc. hairy on each side pinnatifid ; segm. oblong blunt entire, lowest nearly equal
 14397 Fronds pinn. : pinnae altern. subsess. suberr. ciliat. auric. at base on upp. edge, Upp. pinnae bear. sori, Stalk
 14398 Fronds bipinnate : pinnules lin. pinnatifid cut ; segm. mucronate serrate at end, Stalk chaffy [chaffy
 14399 Fronds bipinn. : pinnules lin. lanc. cut serr. Serrat. 2 or 3 toothed : those at end most ac. Sori obl. lunate

14400 Frond lanceolate pinnate : pinnae cordate pinnatifid hairy on each side, Lobes rounded repand
 14401 Fronds bipinnatifid : pinnae oblong blunt ; lower repand, upper entire

14402 Fronds bipinnate : pinnules lanceolate serrate sharpish ; upper confluent, Stalk smooth, Stem arboreous

14403 Frond tripinnatifid lobed smooth : segments linear entire, Stalk winged, Columella included

14404 Frond alternately bipinnatifid : segments and invol. serrated, Sori solitary axillary

OSMUNDACEÆ.

14405 The only species

14606 Fronds pinnat. : ster. bipinnatif. ; segm. ov. obl. obt. entire, Stalk woolly, Fertile fronds bipinnate woolly
 14607 Frond bipinnate bearing the spike at end : pinnules cordate-lanceolate smooth
 14608 Fronds bipinnatifid rusty with down contracted and fertile at the end
 14609 Fronds bipinnatifid entire smooth interrupted in the middle by 3 pair of fertile pinnated racemes
 14610 Fronds bipinn. : pinnules lanc. sharply serrat. cune. at base ; all altern. A fert. bipinn. panic. at end of frond

14611 Stem flexuose round, Fronds conjugate pinnate, Leaflets bearing spikes on each edge
 14612 Stem flexuose climbing, Fronds conjugate 3-4-lobed palmate, Lobes lanceolate acute entire
 14613 Stem flexuose climbing, Fronds conjugate cord. 5-lobed palmate, Lobes lanc. ent. obt. obscurely sinuated

14614 Frond bipinnatifid hirsute : segments cuneate lined blunt and serrated at end
 14615 Frond 3-pinnatifid triangular : segm. ovate acute toothletted at end, beneath and the rachis downy

OPHIOGLOSSEÆ.

14616 Scape with a simple frond above, Frond pinnate : pinnae lunate entire
 14617 Scape none, Fronds radical 3-parted bipinnate : pinnules lunate crenate
 14618 Scape with a simple frond at bottom, Frond 3-parted bipinnatifid : segm. linear 2-parted 2-toothed at end
 14619 Scape frondose in midd. Frond subtern. 3-parted bipinnatifid, Leaflets cut pinnatif. Segm. obtuse 3-toothed
 14620 Scape with a simple frond at bottom, Frond mostly bitern. Leaflets obl. lanc. serrul. unequally cord, at base

and Miscellaneous Particulars.

2203. *Hymenophyllum*. From *ἕμειν*, a membrane, and *φυλλον*, a leaf, in allusion to the tenuity of the foliage. This and the last are the most elegant of all ferns ; they generally grow in damp shady places among moss, and have hitherto refused cultivation under any plan which has been devised.

2204. *Toodea*. Named after Tode, an experienced mycologist, author of *Fungi Mecklenburgensis*. Mr. Brown unites this genus to *Osmunda*, but Kaulfuss keeps them distinct.

2205. *Osmunda*. A word said to be of northern origin, and to have received its name on account of its potential qualities in medicine. *Osmunder* was one of the names of Thor, a Celtic divinity, and *mund*, in Anglo-Saxon, is expressive of force or power. These are noble species of hardy ferns. *O. regalis* is the finest of all our native species.

2206. *Lygodium*. From *λυγος*, a band. The species are elegant twining plants, which bind together the grass or small shrubs near which they chance to grow. *L. palmatum*, although a North American plant, must have the protection of a good frame.

2207. *Anemia*. From *ἀνιμειον*, naked ; in allusion to the naked spikes of inflorescence ; whence some authors write the word *Anemia*.

2208. *Botrychium*. Derived from *βοτρυς*, a bunch, on account of the bunch-like form of its fructification. *Botrychium virginicum* is the largest of the American kinds, and is called the rattle-snake fern, from the circumstance of its generally growing where these venomous reptiles are usually found.

2200.	OPHIOGLOSSUM L.	ADDER'S-TONGUE.	Sp. 3-9.

History, Use, Propagation, Culture,

2209. *Ophioglossum*. From *οφις*, a serpent, and *γλωσση*, a tongue. The little green narrow-pointed leaves, seated on a narrow stalk or neck, and peeping up from among the grass, may be not unaptly compared to a snake's tongue.

14621 Frond ovate veinless

14622 Spike cauline, Frond cordate acute reticulated

14623 Spike cauline, Frond subcordate ovate obtuse, Root bulbous

14624 Fronds bipinnate: pinnules acutely serrate, Rachis scaly: partial winged

and Miscellaneous Particulars.

2210. *Marattia*. In honor of J. E. Maratti, a writer upon ferns. He lived at Vallombrosa, in Tuscany. Kaulfuss considers this, *Danaea*, and *Angiopteris* as constituting a particular tribe, which he calls *Marattiaceæ*, but of which he has not given the characters

Reproductive organs uniform, in terminal spikes, composed of peltate, several-sided scales, producing on their under surface 4-7-elongated involucres containing the seeds. Branches whorled, rigid.

This order contains one genus only, which is among the most puzzling of all the anomalous formations which are so frequently met with among the lower orders of vegetation. Both the stems and branches are regularly articulated, and arise from a tubular sheath. There are no leaves, and the reproductive organs are arranged in a terminal spike (b), on all sides of which are inserted many peltate scales (a) with several sides or angles. Several wedge-shaped hollow bodies project from the surface of these scales, and bursting inwardly, discharge their contents, which are not yet well understood. They consist of a number of green roundish bodies, surrounded by minute granules, and furnished at the base with four elastic filaments (c), thickened at their apex. By some observers the granules have been considered pollen, the filaments stamens, and the green bodies ovaries; by others the granules have been called naked seeds; by Kaulfuss the wedge-shaped hollow bodies are considered capsules, and the green bodies, seeds. It is probable that none of these theories are true.

2209. *Equisetum*. Character the same as of the order.

History, Use, Propagation, Culture,

2211. *Equisetum*. Literally, horse-hair, from *equus*, a horse, and *seta*, hair; so called, in allusion to the fine branches of all the species. The first five species are noxious weeds on deep loamy soil, especially such as has been gained from rivers or lakes. *E. fluviatile* rises three or four feet high, the thickness of a finger, with numerous branchlets or leaves proceeding from the whorls; according to Haller, this species was eaten by the common people among the Romans. Linnaeus affirms, that rein-deer, who refuse hay, will, however, eat this

- 14625 Ster. stems decumb. with simp. branches, which are rough. tetragon. : fertile ones erect simp. their sheaths cylind. inciso-dentate

 14628 Stems branch. upw. with branches about 12 in a whorl simple pentagon. smooth, Spike or catkin terminal
 14629 Stems branched glabrous sulcate, Branches simple pentagonal, Spike terminal
 14630 Stems naked very rough branched at base, Sheaths black with white membran. lanc. teeth, Spike terminal
 14631 Stems simple erect very rough bearing spikes at the extremity, Sheaths whitish black at base and summits, Teeth aristate deciduous

and Miscellaneous Particulars.

that it is cut as fodder for kine, but that it is not so acceptable to horses. E. hyemale is the best species for polishing wood and metal, and is imported from Holland for that purpose under the name of Dutch rushes. It is much used by whitesmiths, cabinet-makers, and comb-makers, and formerly it was in demand for scouring pewter and wooden things in the kitchen.

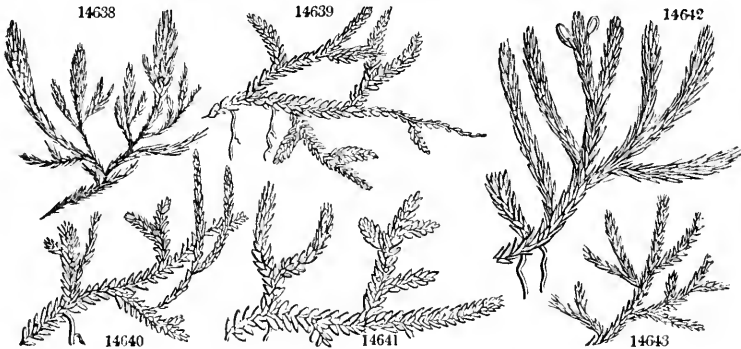

Reproductive organs axillary, sometimes apparently spiked. Thecæ? of two kinds, the one containing minute granules, the other larger bodies. Stems covered with many small leaves.

THE reproductive organs of these plants are always axillary, the apparently spiked arrangement which they occasionally present being caused by the partial abortion of the leaves, at the base of which they are seated. The thecæ (a)? the nature of which is very doubtful, and which have accordingly been called by different writers *capsules*, *conceptacuta*, and *cocci*, are formed of from one to three valves, and of a similar number of cells, and contain either a mass of minute powdery granules, or some corpuscles of a larger size. The nature and properties of both these are uncertain. Deandolle imagines that one may be the means of fertilizing the other.

- 2210. *Lycopodium*. Thecæ reniform, 1-celled, 2-valved, with many sporules. Sporules very minute, powdery.
- 2211. *Psilotum*. Thecæ 3-coccos, 3-celled; cells opening upwards, half 2-valved.

History, Use, Propagation, Culture,

2212. *Lycopodium*. From *λυκος*, a wolf, and *πυς*, a foot; on account, as Dalechamp assures us, of the resemblance the roots bear to a wolf's foot. Selágo is an ancient word applied to some succulent plant, and derived, according to De Theis, from the Celtic *set*, sight, and *jach*, salutary, as being useful for complaints in the eyes. From the same root *set*, was formed *setima*, the name of Fingal's hall, which in modern language would be called *Belle-vue*. The species are neat little evergreen moss-like herbaceous plants, some of which are found in all parts of the world. *L. helveticum* is a pretty prostrate plant, with small bright green leaves; for the beauty of which it is often cultivated in hothouses on the edge of the aquarium, or in pots set in pans of water. *L. Phlegmaria* is a fine species found in various parts of the East Indies, but hitherto a stranger to our gardens. It is a parasite upon the trunks of trees, whence it hangs down in tufts from six inches to

- 14632 Stem creeping, Branches ascending, Leaves scattered incurved and hair-pointed, Spikes geminate cylindrical pedunculate : their scales ovate acuminate crosso-dentate
 14633 Stem erect, Branches altern. dichotom. Leaves bifarious connate spreading at end, Spikes 4 round cylind.
 14634 Stems prostrate, Branches dichotomous and fasciculate, Leaves quadrifarious oblong convex acute appressed, Spikes terminal solitary sessile short cylindrical
 14635 Stem erect, Branches alternate compact dichotomous spreading, Spikes solitary terminal sessile
 14636 Stem creeping, Branches ascending dichotomously branched, Branchlets simple, Leaves in 5 rows linear lanceolate mucronate serrulate patent, Spikes oblongo-cylindrical solitary sessile terminal
 14637 Stem creeping, Branches simple solitary erect with a single sessile leafy spike at its extremity, Leaves linear scattered acute entire curved upwards
 14638 Stem creep. Branches ascend. simple, Lvs. scattered lanc. subpatent ciliato-denticul. Spikes term. solitary
 14639 Leaves bifarious spreading ovate acute : of the surface distichous ciliated flat, Spikes roundish sessile
 14640 Lvs. bifar. $\frac{1}{2}$ -cord. blunt : of surface altern. distichous ovate-obl. blunt, Spikes stalked term. mostly in pairs
 14641 Lvs. bifarious ovate subcord. acute toothletted : of surface altern. ovate acute, Spikes terminal short sessile

 14643 Stem creeping branched, Leaves scatt. imbric. ciliated with a hair at end, Spikes solitary sessile terminal
 14644 Leaves in 8 rows linear-lanceolate toothletted acute spreading reflexed, Stem ascending bifid
 14645 Lvs. bifarious roundish ovate acute flat toothl. Stem branched rooting at base, Spikes term. sess. subsolit.
 14646 Branches nearly simple long ascend. with one spike at top, Lvs. lin.-subul. toothed at base, Spike sess. leafy

14647 Stem dichotomous, Branches 3-cornered

and Miscellaneous Particulars.

foot in length. L. Selago is used in Skye, and some other places, to fix colours in dyeing, instead of alum. The Highlanders employ it in infusion as an emetic and cathartic ; but it operates violently, and, unless taken in a small dose, brings on giddiness and convulsions. Linnaeus says, the Swedes use a decoction of it to destroy lice on swine and other animals. All the species may be cultivated in a light peaty soil, but they require an abundance of moisture.

2213. *Psilotum*. From $\Psi\iota\lambda\omicron\varsigma$, naked. This is a little bushy evergreen herbaceous plant of no beauty. Its branches are 3-cornered, and altogether destitute of leaves. The thecae appear from the little indentations of the branches, and are of a whitish-yellow color. It is easily cultivated in a little peat and sand, but it has no merit except as an object of curiosity.

Order 4.

MARSILEACEÆ.

Reproductive organs radical, uniform. Sporules contained in roundish one or many-celled indchiscent heads. Plants simple, aquatic.

VERY few plants are found in this order. Their vegetation is various; they are at most a few inches high, and are more or less aquatic. In Isoetes the leaves resemble those of a young rush. The organs of reproduction are always near the root, and are variable, and their nature is by no means understood. In *Pilularia* (a) it consists of a roundish head, divided internally into 1-4-cells, each cell containing small bodies of two kinds. In *Isoetes* (b) the fructification is even less known and understood.

2214. *Isoetes*. Head membranous, not opening, immersed in the base of the frond, 1-celled. Sporules angular, inserted upon many filiform receptacles.

2215. *Pilularia*. Heads imbricated, solitary, nearly sessile, globose, coraceous, 4-celled. Cells containing two kinds of bodies.

14649 globulifera W.	Pepper-grass		½ jn.s	Br	Britain	moi.h.	D p.l	Eng. bot. 521

History, Use, Propagation, Culture,

2214. *Isoetes*. From 1705, equal, and 1705, the year; a plant which remains the same through all the seasons. A very curious little submersed aquatic, which grows at the bottom of some of the Scotch lakes. The leaves are long and cylindrical, whence the English name Quill-wort.

Order 5

MUSCI.

Reproductive organs of 2 kinds. Theca many-seeded, solitary, furnished with an operculum and columella. Plants leafy.

Mosses are distinguished from all other similar plants, by the peculiar nature of the reproductive organs, which are of two kinds. The principal and the most obvious is a theca (a, b), which is furnished with an operculum or lid (c), by means of which the sporules are retained in the theca, and a columella, or central axis, to which they are attached. The other consist of minute spherical pedicellated organs, concealed in the axils of some of the leaves, and called anthers by Hedwig. The theca is either entire, or split into four valves, as in *Andreaea*; when in a very young state it is enclosed in an indusium, which is torn asunder as the theca is elongated, and being carried up with it, remains upon the summit of the theca in the form of a little extinguisher called

1468 Fronds subulate half-cylindrical, Heads roundish 2-celled

1469 Filiform branched creeping, Heads brown

and Miscellaneous Particulars.

2215. *Pilularia*. From *pilula*, a pill. The little heads in which the reproductive organs are enclosed resemble pills. An obscure little plant found creeping among grass in meadows in many parts of England, and especially in damp places which are overflowed during winter.

calyptra (*d*); if the calyptra is slit up one side it is called *dimitate* (*d*), if divided at the base into many short clefts, it is termed *mitriform* (*e*). The orifice of the theca, when the operculum is removed, is either covered by a simple membrane, or by various processes called the *peristome* (*f*), either annular, or in the form of teeth, and arranged in a single or double row. These processes vary in number, and in the manner of their division; from such differences excellent characters for the genera have been obtained.

The minute attention which mosses have received in modern times has brought their arrangement to a degree of perfection unknown in other Cryptogamic orders. This has been effected by the labor of Hooker, Greville, and Brown in our own country, and of Hedwig, Swartz, Bridel, Schwaegeichen, Palisot de Beauvois, Nees von Esenbeck, and Hornschuch abroad. The arrangement of the two last authors is chiefly adopted here from their excellent *Bryologia Germanica*.

With this order, the alteration in the form of our page, of which we have already spoken, commences. The columns indicating the *habitat*, *habitation in the garden*, *propagation*, and *soil*, are necessarily omitted; and their place is supplied by a more extended *popular character*, and more detailed references to plates. The heights indicated are to be understood as in inches, and not as feet; and the colors as the general color of the plant. In the figures it has been also found necessary to represent the plants in many cases much magnified; whenever this has taken place, the figures which are larger than nature are distinguished by a * affixed to their number. The popular synonyms of this and the succeeding orders have been rendered as complete as possible, especially with reference to Sowerby's English Botany, to which valuable work this will be a complete modern index even in Cryptogamia.

TRIBE I. EVAGINULATI.

Theca entirely sessile; its receptacle stalked, and without perichætal leaves.

2216. *Sphagnum*. Receptacle of theca stalked. Peduncle resembling a fruitstalk. Theca sessile on the receptacle. Mouth naked.

TRIBE II. VAGINULATI OLOCARPI

Theca more or less stalked; with perichætal leaves; not valvular.

A. *Theca terminal.*

* *Theca indichæscut.*

2217. *Phascum*. Theca entire, adnate with the persistent lid. Calyptra shorter than the theca.

**** Theca dehiscent. Peristome absent.**

2218. *Schistostega*. Fruitstalks terminal; mouth of theca naked. Lid lacinated, with deciduous segments.
 2219. *Gymnostomum*. Fruitstalk terminal. Calyptra dimidiate. Mouth of theca naked.

***** Theca dehiscent. Peristome present.**
 † *Peristome single.*

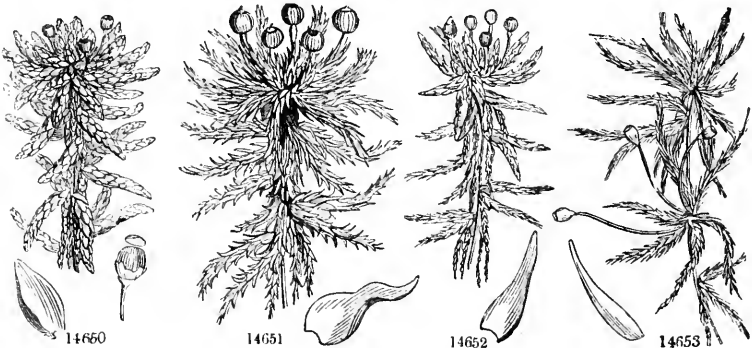

2220. *Hymenostomum*. Fruitstalk terminal. Peristome destitute of teeth, but having an inner horizontal membrane perforated in the middle.
 2221. *Tetraphis*. Fruitstalk terminal. Peristome of 4 erect teetn.
 2222. *Encalypta*. Fruitstalk terminal. Peristome single of 16 teeth. Calyptra cylindrico-campanulate, wholly concealing the nature of the theca.
 2223. *Grimmia*. Fruitstalk terminal. Peristome single, of 16 entire or perforated rarely cleft teeth. Calyptra mitriform.
 2224. *Weissia*. Fruitstalk terminal. Peristome single, of 16 entire equidistant teeth. Calyptra dimidiate.
 2225. *Dicranum*. Fruitstalk terminal. Peristome single, of 16 bifid equidistant teeth. Calyptra dimidiate.
 2226. *Trichostomum*. Fruitstalk terminal. Peristome single, of 16 equal teeth divided to the base, or 32 in pairs. Calyptra mitriform.
 2227. *Cinclidotus*. Fruitstalk terminal. Peristome single, of 32 filiform twisted teeth anastomosing at their base. Calyptra mitriform.
 2228. *Tortula*. Fruitstalk terminal. Peristome single, of 32 filiform twisted teeth, nearly free, or more or less united by a tubiform membrane. Calyptra dimidiate.
 2229. *Pterogonium*. Fruitstalk lateral. Peristome single, of 16 entire equidistant teeth. Calyptra dimidiate.
 2230. *Didymodon*. Fruitstalk terminal. Peristome single, of 16 bifid equidistant teeth. Calyptra dimidiate.
 2231. *Splachnum*. Fruitstalk terminal. Peristome single, of 8 geminate teeth. Theca with an evident apophysis. Columella exerted, capitate. Calyptra mitriform.
 2232. *Conostomum*. Fruitstalk terminal. Peristome simple; teeth solitary, entire, separate at base, 16 in number, united at the tips.
 †† *Peristome double.*
 2233. *Othotrichum*. Fruitstalk terminal. Peristome mostly double; outer one of 16 teeth, approaching in pairs; inner one of 8-16 ciliary processes or none. Calyptra mitriform. Columella capitate.
 2234. *Zygodon*. Fruitstalk terminal. Peristome double or simple; teeth in pairs. Calyptra cucullate.
 2235. *Diphyscium*. Fruitstalk terminal. Peristome always double; outer with 16 teeth: teeth obscure. Theca subsessile.

History, Use, Propagation, Culture,

2216. *Sphagnum* A name employed by Pliny to distinguish some kind of moss that grew upon trees. In this genus the theca is sessile, being entirely destitute of a real fruitstalk. That which appears like one is the footstalk of the receptacle, which in most of the *Sphagna* is so much lengthened out as greatly to exceed the perichætal leaves. All the species agree in the peculiar structure of the leaves, of which the reticulation is

2226. *Buzbaumia*. Fruitstalk terminal. Stem none. Theca oblique, gibbous. Peristome double: outer one of many filiform, torulose processes; inner one of a conical plicate membrane. Calyptra mitriform.

2227. *Funaria*. Fruitstalk terminal. Peristome double, oblique; outer and inner ones each of 16 teeth, opposite to each other.

2228. *Bartromia*. Fruitstalk terminal. Theca subglobose. Peristome double: outer one of 16 teeth; inner one of a membrane cleft into 16 bifid segments. Calyptra dimidiata.

2229. *Pohlia*. Fruitstalk terminal. Peristome double: teeth separate acute; membrane with 16 processes, which are entire at the end without cilia.

2240. *Bryum*. Fruitstalk terminal. Peristome double: outer one of 16 teeth; inner one of a membrane cut into 16 equal segments, with filiform processes often placed between them. Calyptra dimidiata.

2241. *Polytrichum*. Fruitstalk terminal. Peristome double: outer one of 32 or 64 equidistant incurved teeth; inner one of a dense horizontal membrane connected with the outer teeth. Calyptra dimidiata.

B. Theca lateral.

2242. *Anictangium*. Fruitstalk lateral. Calyptra mitriform. Mouth of theca naked.

2243. *Fissidens*. Fruitstalk lateral. Peristome simple. Calyptra smooth. Teeth bifid.

2244. *Leucodon*. Fruitstalk lateral. Peristome simple, with bifid processes.

2245. *Fortinatis*. Fruitstalk lateral. Peristome double: outer one of 16 teeth; inner one of 16 ciliary processes formed by transverse bars into a reticulated cone. Calyptra mitriform.

2246. *Anomodon*. Fruitstalk lateral. Peristome double: the first of 16 teeth; the second of 16 ciliary processes arising from the teeth. Calyptra dimidiata.

2247. *Neckera*. Fruitstalk lateral. Peristome double: outer one of 16 teeth; inner of 16 ciliary processes, connected only at the base by a short membrane. Calyptra dimidiata.

2248. *Dalmania*. Fruitstalk lateral. Peristome double: membrane figured, with 16 ciliae and reflexed teeth.

2249. *Hookeria*. Fruitstalk lateral. Peristome double: outer one of 16 teeth; inner one of a membrane cut into 16 entire segments. Calyptra mitriform.

2250. *Leskea*. Fruitstalk lateral. Peristome double. Membrane with 16 entire processes. Teeth erect or reflexed. Calyptra cucullate.

2251. *Hypnum*. Fruitstalk lateral. Peristome double: outer one of 16 teeth; inner of a membrane cut into 16 equal segments, with filiform processes often between them. Calyptra dimidiata.

TRIBE III. VAGINULATI SCHISTOCARPI.

Theca more or less stalked, with perichatial leaves, ratular.

2252. *Andreaea*. Theca 4-valved; valves cohering at apex, and adnate with the persistent lid.

EVAGINULATI.

14650 Branches tumid, Leaves ovate obtuse

α Stems loosely tufted, Leaves closely imbricated

β Stems densely tufted, Leaves closely imbricated

γ Stems much lengthened, Leaves scattered remote

14651 Branches attenuated at their extremities, Leaves ovato-acuminate squarrose recurved

14652 Branches attenuated, Leaves ovate-lanceolate crowded

History, Use, Propagation, Culture,

which are not only amongst the minute of mosses, and often scarcely discernible to the naked eye, but also extremely dissimilar in appearance to each other.

2218. *Schistostega*. From $\sigma\chi\iota\sigma\tau\epsilon\gamma\alpha$, to split, and $\sigma\tau\epsilon\gamma\eta$, a covering, in allusion to the singular character of the lid splitting at the margin. The only known station for this minute moss is said by Dr. Hooker, from whose *Muscologia Britannica*, many of the remarks in this work upon the genera of mosses are borrowed, to be in the road from Zele to South Tawton church, near Okehampton, Devonshire.

2219. *Gymnostomum*. From $\gamma\upsilon\mu\alpha\sigma$, naked, and $\sigma\tau\omicron\mu\alpha$, the mouth, in allusion to the processes called teeth, from the orifice of the theca. Very minute plants, many of which are barely distinguishable by the naked eye.

•• *Creeping shoots none.*

- 14655 Leaves entire lanceolato-subulate, Innovattons elongated
 14656 Leaves lanceolato-subulate flexuose crisped when dry
 14657 Leaves subulato-setaceous straight : their nerve disappearing below the point
 14658 Leaves lanceolato-subulate straight : their nerve disappearing below the point, Fruit at length lateral
 14659 Leaves patent narrow-ovate serrated : their nerve disappearing below the point
 14660 Leaves ovato-rotundate acuminate concave connivent : the nerve reaching to the point
 α Leaves sharply serrated at point
 β Leaves entire
 14661 Leaves ovato-acuminate erect : their nerve reaching to the point
 α Leaves apiculate
 β Leaves hair-pointed
 14662 Leaves ovate apiculate, Thecæ elliptical
 14663 Leaves ovate with a short point, Thecæ globose, Fruitstalk nearly erect
 14664 Leaves narrow-ovate acuminate, Thecæ globose, Fruitstalk curved

14665 The only species

• *Stem long, branched.*

- 14666 Leaves linear lanceolate crisped when dry : perichæial broadly ovate, Thecæ turbinate striated
 14667 Lvs. lanc. twist. when dry : the perichæial ones broadly ovate ; their marg. involute, Thecæ obl. smooth
 14668 Leaves broadly lanceolate, Thecæ ovate, Lid obliquely rostrate
 14669 Leaves subulate, Thecæ turbinate ovate, Lid obliquely rostrate
 14670 Lvs. lin. subul. spreading flexuose twisted when dry, Thecæ ovate, Lid conical rost. shorter than thecæ

•• *Stems short simple.*

- 14671 Lvs. obov.-rotund. reticul. : their nerve disappear. below summit, Fruitstalk carnosè thick, Lid hemispher.
 14672 Lvs. ovate erect concave piliferous : their nerve furnished with a granuliferous membrane, Lid rostrate
 α Thecæ ovate
 β Thecæ oblong
 14673 Leaves ovate apiculate patent nearly plane, Lid obliquely rostrate
 14674 Leaves lanceolate serrated at the point, Thecæ ovato-oblong, Lid obliquely rostrate
 14675 Leaves oblongo-ovate apiculate, Thecæ ovate, Lid conical obtuse
 14676 Leaves oblongo-acum. nearly plane subserrated margined, Thecæ pyriform, Lid plane submammillate
 14677 Leaves ovato-acum. concave serrated not margined, Thecæ roundish obovate, Lid convex shortly rost.
 14678 Stem scarcely any, Outer leaves very short ovate lanceolate : inner ones linear lanceolate ; all erect obtuse with a strong nerve disappearing below the summit, Thecæ oblong
 14679 Stem very short, Leaves subulate straight, Thecæ turbinate

14680 Lvs. broadly subul. : marg. invol. above flexuose crisped when dry, Thecæ ellipt. contracted at mouth, Lid [subulate incurved]

- 14681 Stems elongated, Leaves ovato-acuminate : those of the perichætium lanceolate, Thecæ cylindrical
 14682 Stems very short, Lvs. few lin. slightly incrassated upw. : those of perichætium ovate obtuse, Thecæ ovate

and Miscellaneous Particulars.

2420. *Hymenostomum*. From ὑμεν, a membrane, and στωμα, a mouth. This genus differs from the last in having a membrane stretched across the orifice of the theca, a character first discovered by Mr. Brown. Minute plants, with the habit of *Gymnostomum*.

2221. *Tetraphis*. The peculiar character of this genus is to have four teeth (τετρα, four). The lid in the only known species of this genus is remarkably thin and scarious in texture, and the teeth are reticulated, not striated as in most mosses. The calyptra is striated or furrowed ; the leaves are rigid.

History, Use, Propagation, Culture,

2222. *Encalyp'ta.* From *en*, within, and *καλυπτω*, a covering or extinguisher, on account of the unusual size of the calyptra, which entirely encloses the theca; a character by which the genus may be distinguished at first sight. Small plants, forming imperfect tufts of green among moist rocks, or on mud-capped walls.

2223. *Grim'mia.* Named in honor of I. F. C. Grimm, a German botanist, who published a Flora of Eisenach

- [Calyptra toothed at the base
 14683 Stems elong. Lvs. elliptico-lanc. somew. obt. : nerve not produced beyond summ. Theca cylind. spirul. striat
 14684 Stems short, Leaves oblongo-elliptical obtuse : their nerve produced a little beyond the summits, Theca cylindrical smooth, Calypt. entire at the base
 14685 Stems short, Lvs. obl. acum. : nerve produced considerably bey. summ. Theca cylind. Calyp. tooth. at base
 α Leaves apiculate : their points of the same color, Theca smooth
 β Leaves much acuminate : their points diaphanous, Theca smooth
 14686 Leaves oblong acute : nerve as long or longer than the leaves, Theca straight striated

* *Fruitstalks scarcely any.*

- 14687 Stems branched, Leaves ovato-lanceolate recurvo-patent : their margins reflexed ; the perichatial ones having their nerve disappearing immediately below their summits, Theca ovate sess. Lid shortly rostr.
 α Leaves broad dark-green
 β Stem long, Leaves narrow and rufous [running beyond summits, Theca ov. sess. Lid shortly rostr.
 14688 Stems short pulvin. Lvs. lanc. acum. nearly erect crisp. when dry : marg. recurv. ; perich. ones with nerve

** *Fruitstalks longer than leaves.*

- 14689 Stem scarcely any, Lvs. lin.-subulate crisped when dry, Theca ovate, Fruitst. geniculate, Lid rostr. straight
 14690 Stems short pulvinate, Leaves narrow elliptical : their margins recurved ; points diaphanous piliform, Theca ovate striated, Fruitstalks curved, Lid conical acuminate
 14691 Stem rather short, Lvs. ov. with long white pilifer points, Footst. very short, Theca ov. Lid obscurely rostr.
 14692 Stems short, Leaves lanceolate acuminate carin. entire much crisped when dry : their margins recurved ; those of the perichatium broad and convol. Theca turbinate, Lid rostrate
 14693 Stems slightly branched, Leaves lanceolate-subulate gradually produced into long diaphanous hair-like points : their margin incurved, Theca ovate, Teeth of the peristome often perfora. and split, Lid rostr.
 14694 Lvs. lanc. subul. carin. recurv. at edge with a hair-like point, Seta curv. and flex. Theca ov. ellipt. Lid rostr.
 14695 Stems short, Leaves lanceolate-subulate produced into long diaphanous hair-like points : their margin incurved, Theca ovate, Teeth of the peristome quite entire, Lid shortly rostrate

* *Theca with an apophysis.*

- 14696 Lvs. lingul. rounded at top : nerve disappear. before summ. Theca obov. Apophy. obocon. Lid convex acum.

- 14697 Leaves ovato-lanceolate acute, Theca (with the apophysis) narrowly pyriform, Lid nearly plane

** *Theca destitute of an apophysis.*

1. *Leaves ovate or lanceolate.*

- 14698 Stems scarcely any, Leaves ovato-lanceolate nerveless, Theca ovate gibbous on one side cernuous
 14699 Stems elongat. Lvs. lanc. acum. Theca obovate cernuous gibbous sulcate, Lid hemispheric. obtusely point.
 [erect-cernuous, Lid rostrate
 14700 Stem simple short, Leaves broad and bluntly ov. with a short point imbric. Nerve shorter than leaf, Theca
 14701 Stems very short, Lvs. ov. with an excurr. nerve, Theca ov. erect, Lid conical, Teeth of perist. subul. acute
 14702 Stems very short, Lvs. ov. with an excurr. nerve, Theca ov. erect, Lid conic. Teeth of perist. subulate acute
 14703 Stems somew. elongat. Lvs. ov. with an excurr. nerve almost piliferous, Theca ovate, Lid obliquely rostrate

2. *Leaves linear or subulate.*

- 14704 Leaves linear denticul. crisped when dry, Theca ovato-turbinate sulcate erect, Lid obliquely subulate
 α Leaves linear-subulate subserrulate
 β Leaves broad-linear denticulate
 14705 Stems scarcely any, Leaves subulato-setaceous entire, Theca ovate striated, Lid rostrate
 14706 Leaves broadly subulate crisped when dry : their margins recurved, Theca ovate, Lid rostrate
 14707 Leaves linear-subulate, Theca ovate cylindraceous, Lid rostrate
 14708 Stems divid. Lvs. from a broad base lanc.-subul. crisp. when dry : marg. incurv. Theca ov. ellipt. Lid rostrate
 14709 Stems nearly simple, Lvs. lin.-subul. crisp. when dry : their marg. incurv. Theca ovato-ellipt. Lid rostrate
 14710 Stems scarcely any, Lvs. from a broad base lin. obt. thick with a very broad nerve, Theca turbin. Lid rostr.
 14711 Stems scarcely any, Leaves subulate, Theca broadly ovate, Fruitstalks curved, Lid rostrate

and Miscellaneous Particulars.

Plants growing in roundish tufts, and nearly related to *Trichostomum*. *G. pulvinata* is the moss which forms those little cushion-like dark brownish green lumps which are so commonly spotted over the tops of old walls and houses.

223. *Weisia*. In honor of J. W. Weiss, a German cryptogamic botanist. There was also a John

History, Use, Propagation, Culture,

Christopher Weiss, who published, in 1712, a Dissertation on the pomegranate. These plants are chiefly found in wet places, most frequently in alpine countries; in habit they resemble *Gymnostomum*.

2225. *Dicranum*. Named by Hedwig, from *dixearos*, forked, in allusion to the division of the teeth. This is one of the finest genera of mosses, containing many species which form broad masses of turfy vegetation, giving a decided character to the face of the earth where they grow. Like most of the genera of this order,

- 14712 Stems scarcely any, Leaves subulate, Theca ovate, Fruitstalks always erect, Lid rostrate
 14713 Stems branched, Leaves broadly subulate nearly flat rather flaccid, Theca ovate, Lid rostrate
 14714 Stems branched, Leaves subulate-setaceous subsecund rigid canaliculate, Theca turbinate, Lid rostrate

* *Theca without a struma.*

- 14715 Stems branched fastigate, Lvs. erecto-patent ov. lanc. straight nerveless ent. Theca ov. cern. Lid rostrate
 14716 Stems short, Leaves oblong concave entire apiculate or piliferous, Theca erect ovato-oblong, Lid rostrate
 14717 Stems elongat. Lvs. very long subul.-setace. falcato-secund serrul. : nerve very broad, Theca oblongo-ovate [nearly erect, Lid rostrate
 14718 Stems nearly simple rigid, Leaves lanceolato-subulate acuminate straight : their nerve very broad, Fruitstalks flexuose, Theca ovate striated, Lid rostrate
 14719 Stems branched, Lvs. long lanc. serrul. point. in all directions crisp. when dry, Theca obl. erect, Lid rost.
 14720 Stems somewhat branched, Leaves from a broad sheathing base lanceolate obtuse recurved and patent directed to every side crisped when dry, Theca ovate subcervuous, Lid rostrate
 14721 Stems branched, Leaves lanceolate : their margins slightly undulated serrated rather obtuse pointing in all directions, Theca ovate subcervuous, Lid rostrate
 14722 Stems elongated, Leaves fasciculated concave erecto-patent directed to every side ovate : the superior ones lanceolate serrulate, Theca oblong curved, Lid rostrate
 14723 Stems short, Leaves from a sheathing base setaceous nearly distichous flexuoso-recurved crisped when dry, Theca erect ovate, Lid with a long beak
 14724 Stems branched, Leaves erecto-patent directed to every side subulate : their margins plane subserrated crisped when dry, Theca ovate cylindraceous nearly erect, Lid with a long beak
 14725 Stems branched, Lvs. patent directed to every side lanceolate-subulate : their margins recurved flexuose subserrulate crisped when dry, Theca obovate subcervuous, Lid rostrate
 14726 Stems elongated, Leaves nearly plane lanceolate attenuate serrulate at the points transversely undul. Theca cylindrac. cervuous, Lid with a long beak
 14727 Stems elongated, Lvs. narr. subul. canalicul. sec. Theca cylindrac. arched cervuous, Lid with a long beak
 α Leaves falcato secund
 β Leaves subsecund narrow crisped when dry
 14728 Stems short, Leaves narrow hastato-lanceolate, Theca ovate, Lid rostrate
 α Leaves pointing all ways lanceolate green, Theca subcervuous
 β Leaves subsecund lanceolate subulate reddish, Theca erect
 γ Leaves subsecund subulate lurid, Theca subcervuous [stalk, Lid short rostrate
 14729 Stem near. simp. Lvs. very long subul. setac. : nerve obsolete. percurr. Theca obov. erect striat. with a short
 14730 Stems branched, Leaves subul. falcato-secund nearly ent. Theca ovate subcervuous, Lid with a long beak
 14731 Stems branch. Lvs. from a broad sheath. base subul. setace. sec. ent. Theca ov. subcerv. Lid with long beak

** *Theca with a struma.*

- 14732 Stems short, Lvs. lanc. subul. ent. subsec. : nerve very broad, Theca ovate subcerv. strumose, Lid rost.
 [stems, Theca furrowed oblongo-ovate subcerv. strum. Lid rost
 14733 Stems elongat. Lvs. from a broad sheath. base subul. ent. : marg. plane crisp. when dry pointing in all direc.
 14734 Stems elongated, Leaves from a broad sheathing base subulate entire : their margins plane crisped when dry pointing in all directions, Theca furrowed oblongo-ovate subcervuoso strumose, Lid rostrate
 14735 Stems nearly simple, Lvs. long lanc.-subul. falcato-secund nearly ent. Theca ov. subcerv. strum. Lid rost.
 14736 Stem erect simple, Lvs. spread long subul. dilated and amplexic. at base, Theca ov. cernu. strum. Lid rost.
 14737 Stems somew. branch. Lvs. lanc. subul. falcato-secund entire, Theca oblongo-ov. suberect strum. Lid rost.

- 14738 Stems elongat. Lvs. lanc. acuminate carinated : margins recurv. Theca ovate, Fruitst. curved, Lid conic.

- 14739 Stems elongated subpinnate, Leaves lanceolato-subulate acuminate : their long diaphanous points serrat. ; margins recurved, Theca ovate, Fruitstalk short on lateral branches, Lid rostrate
 14740 Stems elongated irregularly branched, Leaves ovato-lanceolate : their diaphanous acuminate points slightly serrated, Theca ovate, Teeth of the peristome very long and filif. Lid subulate
 14741 Stems elongated branched, Leaves ovato-lanceolate : their diaphanous acuminate points slightly serrat. Theca oblong, Teeth of the peristome rather short, Lid rostrate
 14742 Stems elongated branched, Leaves lanceolate : their diaphanous acuminate points slightly serrated, Theca oblong, Teeth of the peristome rather short, Lid rostrate

and Miscellaneous Particulars.

there are species included in this which vary considerably from the common appearance of the group. The most distinct of these forms is, however, removed, after the example of the German muscologists, to Fissidens; which see.

2226. *Trichostomum*. From *τριχ* *τριχος*, hair, and *στομα*, a mouth; the divisions of the mouth of the theca being very fine. The species are for the most part dark green mountain plants, with hair-pointed leaves,

History, Use, Propagation, Culture,

which give them the appearance of being hoary. The genus is nearly related to *Grimmia* both in natural and essential characters.

2227. *Cinclidotus*. So called from *κινκιδωτες*, grated, in allusion to the peculiar netted manner in which the cilia of the peristome are united in parcels. A plant from four to six inches long, growing on stones and wood in streams of water, in many places exceedingly common. Its general appearance is that of *Trichostomum*, whilst the peristome more resembles that of a *Tortula*.

2228. *Tortula*. From *torqueo*, to twist, in allusion to the singular manner in which the teeth of the peristome are twisted together. Small plants, frequently forming thick tufts, and common in almost all situations from

- 14743 Stems elongat. branch. Lvs. lanc. obt. serrulat. at points : nerve vanish. before summ. Theca obl. Lid rostr.
- 14744 Stems elongat. branch. Lvs. lanc. ent. : summ. never diaphan. ; margins recurv. Theca ovato-obl. Lid rostr.
- 14745 Stems branch. Lvs. lanc.-subul. : marg. recurv. serrat. above very much crisp. when dry, Theca obl. Lid rostr.
- 14746 Stems short nearly simple, Lvs. lanc. acum. straight : nerve broad ; margins plane, Theca ellipt. Lid rostr.
- 14747 The only species
- 14748 Stems scarcely any, Lvs. patent obl. rigid : marg. much inflex. Nerve broad, Theca obl. Lid conic. acum.
- 14749 Stems short, Leaves patent linear-oblong : their margins recurved, Nerve produced beyond the leaf into a white hair-like point, Theca oblong, Lid conical acuminate
- 14750 Stems elongated, Leaves oblong carinated patent and recurved, Nerve terminating in a long generally diaphanous serrated point, Theca oblong, Lid subulate, Teeth of the peristome united below in a tube
- 14751 Stems very short, Leaves oblongo-lanceolate acuminate : the nerve excurrent often forming an apiculus, Theca cylindrical, Lid conico-subul. Teeth of the peristome united nearly to the apex into a long tube
- 14752 Stems scarcely any, Lvs. broadly obov. conc. Nerve terminating beyond top of leaf in a rather long and frequently serrulated point, Theca oblong, Lid shortly rostr. Teeth of the peristome united at the base
- 14753 Stems scarcely any, Leaves ovate concave, Nerve running beyond points, Theca ovate striated, Lid rostr
- 14754 Stems elongat. branch. Lvs. lin.-subul. carinate undulate much twisted when dry, Theca cylind. Lid rostr.
- 14755 Stems elongat. branch. Lvs. lanc. subul. pat. or recurv. : marg. refl. Theca obl. Lid rostr. nearly as long as theca
- 14756 Stems short, Leaves lanceolate acum. : the margins of those of the stem remarkably revolute ; perichætial leaves sheathing, their sides involute, Theca oblong, Lid rostrate shorter than the theca
- 14757 Stems branched, Leaves linear-lanceolate obtuse : their nerve produced into an apiculus ; the marg. nearly plane, Theca oblong, Lid rostrate nearly as long as the theca
- 14758 Stems short, Lvs. obl. rather obt. : nerve not protruded ; perichæt. remarkably convol. Theca obl. Lid rostr.
- 14759 Stems much branch. Branches pinn. Lvs. lingul. obt. ent. crisp. when dry : marg. recurv. ; nerve reaching
- 14760 Branches fasciated curved, Leaves broadly ovate acute concave : their margins plane ; summits serrated, faintly 2-nerved at the base, Lid conical
- 14761 Stems irregularly branched curved, Leaves ovate subacuminated concave : their margins recurv. serrated ; nerve single or forked : shoots faint, Lid conical
- 14762 Stems scarcely branched, Leaves lanceolate acuminate carinate : their margins recurved entire, Theca ovato-cylindrical oblique subtrunse furrowed when dry, Lid conical
- 14763 Leaves bifarious from a sheathing base subulate, Theca ovate inclined, Lid conical
- 14764 Leaves obovate shortly apiculate : their nerve incrassated above, Theca ovate erect, Lid shortly rostrate
- 14765 Stems more or less elongat. Lvs. oblon.-ov. flexu. strongly serrat. at point, Theca erect cylindrac. Lid rostr.
- 14766 Leaves closely imbricated on all sides lanceolate much acumin. carinate with the rigid nerve running beyond the point, Theca oblongo-ovate erect, Lid rostrate
- 14767 Leaves rather distant somewhat trifarious lanc. rather obtuse carinated with the nerve scarcely reaching to the point, Theca oblongo-ovate erect, Lid rostrate

and Miscellaneous Particulars.

the banks of the sea-shore to the limits of perpetual snow. The character from which the genus has received its designation, will always indicate the species with perfect truth.

2229. *Pterogonium*. A name altered by Swartz from the *Pterigynandrum* of Hedwig, which was contrived to express that the male and female flowers of this genus of mosses are both present on a pinnated stem. An elegant collection of species, generally found in subalpine countries, where they enliven the trunks of trees and rocks with their bright green trailing entangled stems, which have altogether the habit of *Hypnum*. *P. Smithii* has only been found in this country upon trees in the southern counties, especially in Devonshire.

2230. *Didymodon*. So called, by Hedwig, from *didymos*, double, and *odus*, a tooth, in reference to the geminate

History, Use, Propagation, Culture,

arrangement of the teeth of the theca. In natural habit, the plants of this genus approach on the one hand to Weissia, and on the other to Dicranum. With the former, Dr. Hooker observes that two species are liable to be confounded, viz. *Didymodon inclinatum*, and *D. heteromallum*, each of which has but sixteen teeth, and their approximation in pairs is with difficulty discoverable. *D. inclinatum* is a very rare plant, having been scarcely found any where in this country, except upon the mountains of Cunnemara, in Ireland.

2231. *Splachnum*. Σπλαχνον was one of the Greek names of moss. Generally elegant little plants, with theca of exquisitely beautiful forms. The annual species are usually found growing upon dung, while the perennial are found in more permanent situations. They are in all cases of rare occurrence. *S. Frölichianum* was found on the summit of Ben High, in the Scotch Highlands.

2232. *Conostomum*. From *κωνος*, a cone, and *σωμα*, a mouth, the teeth of the theca being always united at

- 14768 Stems elongated, Leaves nearly distichous subulato-setaceous, Theca erect ovato-cylindrace. Lid conical
 14769 Stems rather short, Leaves subsecund subulate, Theca ovate cylindraceous, Lid conical
 14770 Leaves lanceolate subulate tortuose when dry, Nerve strong, Theca suberect ovate, Lid obliquely rostrate
 14771 Stem branched erect, Leaves lanc. acum. spreading, Nerve reaching apex, Theca oblong with a short lid
 14772 Leaves obovato-rotundate acuminate slightly serrated, Apophysis ovate globose wider than the theca
 14773 Leaves obovato-acuminate serrated, Apophysis obconical narrower than the theca, Columella exerted
 14774 Leaves ovato-lanceolate much acuminat. concave entire, Apophysis obovate nearly as narrow as the theca
 α Deeper color with shorter stems
 β Paler color with longer stems
 14775 Lvs. ovato-lanc. much acuminat. serrat. Apoph. obov. somew. narrow. than theca, Fruitst. scarcely longer
 14776 Leaves ovato-lanceolate acuminated serrated, Apophysis inversely flagon-shaped twice as wide as theca
 14777 Lvs. rhombo-rotund. obt. : the nerve disappearing before point, Apophysis globose much wider than theca
 14778 Lvs. ov. rounded at points : nerve disappear. before summ. Apophysis obovate much narrower than theca
 14779 Stems rather short, Leaves lanceolate acuminated carinated slightly toothed

* *Peristome without ciliary processes.*

- 14780 Lvs. obl. lanc. slightly curl. Theca clav. furrow. Lid with a long beak, Teeth 16 simple, Calyptra very hairy
 14781 Leaves lanceolate erecto-patent, Fruitstalks exerted, Peristome of 8 double teeth, Calyptra slightly pilose
 14782 Leaves lanc. erecto-patent, Theca nearly sessile, Peristome of 16 double teeth, Calyptra slightly pilose

** *Peristome with 8 ciliary processes.*

- 14783 Leaves lanceolato-subulate much crisped when dry, Fruitstalk much exerted, Theca striated, Peristome with 8 ciliary processes, Calyptra very pilose
 14784 Leaves erect spreading narrow-lanceolate crisp when dry, Theca pyriform smooth plaited and contracted at orifice, Calyptra very hairy
 14785 Lvs. erect rigid broad-lanc. Theca somew. immersed striat. toward mouth, Teeth 16, Calyptra very hairy
 14786 Leaves lanceolate erect and nearly straight when dry, Fruitstalks much exerted, Theca striated, Perist. with 8 ciliary processes, Calyptra very pilose
 14787 Leaves patent broadly lanceolate, Theca sessile, Peristome with 8 ciliary processes, Calyptra subpilose

*** *Peristome with 16 ciliary processes.*

- 14788 Stems short, Lvs. lanc. acum. : points diaphan. Theca sess. Perist. with 16 ciliary process. Calypt. subpilose
 14789 Stems short, Lvs. pat. narr. lanc. crisp when dry, Footst. exerted, Perist. with 16 slender ciliary processes, Calyptra subpilose
 14790 Stems elongated much branched, Leaves broadly lanceolate obtuse, Theca sessile, Peristome with 16 slender ciliary processes, Calyptra smooth
 14791 Stems elongated branched, Leaves lanceolate-patent slightly twisted when dry, Theca sess. ovate smooth, Peristome with 16 torulose ciliary processes, Calyptra subpilose
 14792 Stems elongated much branched, Leaves long linear lanceolate recurvo-patent much crisped when dry, Theca obl. striat. Peristome with 16 rather broad distinctly jointed ciliary processes, Calypt. very hairy

ana *Miscellaneous Particulars.*

the points. A curious genus, first established by Swartz, in Schrader's Journal. The British species approaches in habit to *Bartramia fontana*. It is quite an alpine plant, not growing in Switzerland at a lower elevation than 7 or 8000 feet. With us it inhabits the summits of the highest Scotch mountains, particularly in the Breadalbane district. 2233. *Orthotrichum*. From $\alpha\delta\sigma\varsigma$, straight, and $\theta\epsilon\tau\epsilon\varsigma\ \tau\epsilon\lambda\epsilon\sigma$, hair, on account of the straight, not twisted direction of the teeth of the peristome. No genus can be more natural than this, notwithstanding some variations in the peristome of some of the species from the ordinary structure. Thus *O. decipiens* and *anomalon* have no ciliary processes; and *O. striatum* has them of a peculiar shape and beaded appearance. Many of the plants referred to this genus are common occupants of the aged trunks of trees, where they vegetate among the soft earth which collects in the clefts of the dead bark. *O. Lyellii*, which is the finest of our species, is only found on trees in the New Forest.

History, Use, Propagation, Culture.

2234. *Zygodon*. From *ζυγος*, a yoke, and *οδus*, a tooth, and so called, we presume, in allusion to the yoking together by pairs of the outer teeth; but the name is unexplained by its authors. A singular plant, which was referred to *Bryum* by Dickson, and to *Mnium* by Smith. The stems grow in a tufted manner like *Gymnostomum viridissimum*, but rarely exceed half an inch in length. The peristome is double; the outer consisting of sixteen short obtuse teeth approaching in pairs, which at length become recurved; inner of as many alternate ciliae lying horizontally over the mouth of the theca.

2235. *Diphyscium*. From *dis*, twice, and *συσιον*, a vesicle, in allusion to the double nature of the shell of the theca. A little plant found in woods, and on rocks in alpine situations. The stems are exceedingly short, and grow in densely matted patches. The theca is large, ovate, gibbous, and oblique. Dr. Hooker denies the existence of a double peristome, while Hornschuch asserts its presence.

2236. *Buxbaumia*. A very singular plant, destitute of apparent leaves, and resembling a minute fungus rather than a moss. It was named in honor of John Christian Buxbaum, a German botanist, who published, in 1728, an account of the plants of Asia Minor in five centuriæ of figures of little merit. This plant was originally discovered in the vicinity of Astrachan, afterwards in a fir-wood near Norwich, and lately in two stations in Scotland. Its minute size and want of foliage may have caused it to be overlooked.

2237. *Funaria*. From *funis*, a rope, in allusion to the twisted nature of the strongly hygrometrical fruit-stalk. This genus, though sufficiently characterized by the interior teeth or ciliae being oblique and placed

14793 The only species

14794 The only species

14795 The only species

14796 Leaves very concave ovate apiculate entire, Nerve excurrent, Fruitstalk curved flexuose

14797 Stems short, Lvs. conc. ov. suddenly acuminat. serrat. : the nerve disappear. below point, Fruitst. straight

14798 Stems elongat. Lvs. plane ov.-lanc. gradually acuminat. serrat. Nerve disappear. bel. point, Fruitst. straight

* *Fruitstalks long, not curved.*

14799 Leaves patent subulate strongly serrated : the nerve reaching to the summit twisted when dry

α Leaves flexuose

β Leaves crisp

[into the substance of the leaf straight when dry, Fruitstalks much elongated

14800 Stems short, Leaves rigid erecto-patent subulate-setaceous almost entire : the nerve half-way up passing

14801 Stems elongated, Leaves recurvo-patent lanc. canaliculate serrat. Fruitstalks lateral from innovations

14802 Stems fastig. Lvs. closely imbricat. rig. erect broadly ovate or lanc. acuminat. nearly plane serr. Fruitst. lat. [from innovations

α Leaves broad ovate acuminat

** *Fruitstalks very short, curved.*

14803 Stems much elongat. prolifer. Lvs. long subul. flexu. serrat. above, Fruitst. lat. from innov very short curv.

14804 Stems much elongated proliferous, Leaves horizontally patent ovato-lanceol. acuminat. striated, Fruitstalks very short arcuate at length lateral, Theca smooth

14805 Stems short branched with innovations, Leaves ovate acuminat. nearly entire : the margins slightly recurved ; the nerve running beyond the points, Theca elong.-pyrif. pendulous

14806 Stems short, Lvs. erect elong.-lanc. acuminat. serrat. Nerve reaching to point, Theca elongato-elev. inclined

14807 Stems short, Leaves ovate acuminat. entire or very obscurely serrated at the points : the marg. slightly recurved ; the nerve reaching to or beyond the point, Theca between ovate and pyriform pendulous

14808 Stems elongated branched with innovations, Leaves oblong acuminat. scarcely serrul. : margins recurved nerve reaching beyond the point, Theca oblongo-obovate pendulous

* *Theca sulcated.*

14809 Stems nearly simple, Lvs. lanc. serrat. : their marg. recurv. Theca nearly erect cylind. sulcat. Lid conical

14810 Stems much branch. Lvs. lanc. obt. cut. : their margins revolute, Theca ovate oblique sulcat. Lid conical

and *Miscellaneous Particulars.*

opposite to those of the outer, is further remarkable in these teeth lying horizontally over the mouth of the theca. In the male flowers of Hedwig, the succulent filaments are remarkably clavate, jointed, pellucid, the joints containing greenish granules. *Funaria hibernica* has been found only on the roof of a thatched cottage at Blarney, near Cork, Ireland. The long flexuose fruitstalk of *F. hygrometrica*, one of the commonest of mosses in almost every situation, possesses strong hygrometrical qualities.

2238. *Bartramia*. So called in honor of John Bartram, an Anglo-American, to whose researches in North America the gardens of Europe owe many of their finest trees. He had a son William, who published in 1773, an account of a journey in the interior of North America. This is an elegant genus of mosses, remarkable for their fine capillary light green leaves, and spherical capsules. The genus approaches nearly to *Bryum*, but differs in almost every species having a spherical capsule ; and the sixteen broad segments of the inner peristome, instead of being entire or only perforated, are cleft like the teeth of a *Dicranum*.

2239. *Pohlia*. Named in honor of I. E. Pohl, a German botanist. Small plants, often referred to *Bryum*, with which they entirely agree in habit.

2240. *Bryum*. One of the ancient Greek names of moss. These are all dwarf plants producing capsules in abundance, and generally found growing in wet places. In *B. palustre* are found terminal caputular bodies, which much resemble what are called the anthers of *B. androgynum* ; but in *B. palustre* they are considered gemmæ, and arise not only from the main stems, but also from the innovations. *B. triquetrum* has only been

History, Use, Propagation, Culture,

found in Great Britain upon the borders of some lake in the north of Ireland. By Mohr it is considered a distinct genus, and called *Diplocomium*.

*** *Theca destitute of furrows.*

A. *Exterior peristome shorter than interior.*

- 14811 Stems somew. branch. Lvs. lin. obt. ent. reticulat. Theca obovate recurved subcernu. Fruitstalk very long
 14812 Stems branched, Leaves ovate cuspidate reticulated shorter than nerve, Theca curved pyriform pendulous
 14813 Stem elongat. branch. Lvs. lanc. carin. ac. serrated reticulat. Theca pyrif. erecto-cernu. Fruitst. very loog
 14814 Stems short, Leaves lanceolate acute plane serrated at the points reticulated, Theca pyriform nearly erect

B. *Peristomes equal.*

§ 1. *Leaves without a thickened margin.*

- 14815 Stems slightly branched, Leaves subul.-setaceous flexuose serrated: nerve very broad, Theca pyrif. pendul.
 14816 Stems branched, Leaves closely imbricated broadly ovate concave entire obtuse: nerve running nearly to the point, Theca obovato-cylindraceous pendulous
 14817 Stems simple, Leaves rigid lanceolate: the upper ones the narrowest and longest; all of them plane serrul. nerve disappearing below the summit, Theca oblong-subpyriform cernuus
 14818 Stems simple, Lvs. lanc. reticulat. slightly serrul. at point: nerve disappear. bel. summ. Theca obov. pendul.
 14819 Stems branched, Leaves closely imbricated broadly ovate suddenly and sharply acuminate subserrulate very concave: nerve disappearing below the point, Theca ovato-pyriform pendulous
 14820 Stems branch. Leaves closely imbricated more or less broadly ovate acuminate very concave reticulated entire: nerve running nearly to the point, Theca clavate cernuus
 14821 Lvs. obovato-spathulate acute serrated undul.: nerve running to the point, Theca oblongo-ovate pendul.
 14822 Stems short, Leaves obovate twisted when dry entire: their nerve produced into a hair-like point; their margins slightly thickened, Theca oblong pendulous
 14823 Stems short, Lvs. erect lanc. acuminate serrated above: nerve reach. to point, Theca oblon.pyrif. pendul.
 14824 Stems rig. elongat. branch. Lvs. closely imbricat. erect lanc. somew. obt. subserrul. at apex: marg. revolute; nerve reaching to the points, Theca oblongo-ovate pendulous

§ 2. *Leaves with a thickened margin.*

- 14825 Stems elongated, Leaves obovato-rotundate very obtuse reticulated: their margins thickened entire; nerve disappearing below the point, Theca ovate pendulous, Lid shortly rostrate
 14826 Stems elongated, Leaves undul. ligul. reticulated: their margins thickened denticul.; nerve reaching a little beyond the point, Theca ovate pendulous, Lid conical
 14827 Stems elongated, Leaves broadly ovate reticulated: their margins thickened denticulated; the nerve reaching a little beyond the point, Theca ovate pendulous, Lid rostrate
 14828 Stems elongated, Leaves ovate acute reticulated: their margins thickened serrated; nerve reaching a little beyond the point, Theca ovate pendulous, Lid shortly rostrate
 14829 Stems elongated, Leaves lanceolate acute reticulated: their margins thickened denticulate; nerve generally disappearing below the summit, Theca oblongo-ovate pendulous, Lid hemisph. mucronulate
 14830 Stems elongated, Leaves obovate acute reticulated: their margins thickened denticulated above; nerve running beyond the point, Theca ovate pendulous, Lid conico-hemispheric. obtuse

* *Calyptra naked.*

- 14831 Lvs. lanc. undul.: their margins plane denticulat.; their nerve winged, Theca cylind. curved, Lid subul.
 14832 Lvs. lanc. rig. ent.: their sides invol.; their nerve broad impress. with furr. Theca obl. suber. Lid conical

** *Calyptra hairy.*

- 14833 Leaves lanceolate-subulate: their margins involute ent. terminating in a pellucid hair-like point, Theca ovate obtusely quadrangular furnished with an apophysis, Lid conical
 14834 Leaves lanceolate-subulate: their margins involute entire; their points acumin. colored subserrated, Theca ovate obtusely quadrangular furnished with an apophysis, Lid conical
 14835 Leaves linear-subul. obtuse: their margins especially towards the top invol. subserrulate, Theca ovate subangulate furnished with a minute apophysis, Lid conical acuminate
 14836 Stems elongated, Leaves patent linear-subulate: their margins plane serrated as well as the points of the keels, Theca erect ovate quadrangular with an evident apophysis
 α Leaves with their margins of the same color
 β Leaves shorter with their margins pellucid

- 14837 Stems elongated branched, Leaves patent subulato-lanceolate: the margins plane serrated as well as the points of the keels, Theca subovate with an indistinct apophysis
 14838 Stems elongated branched, Leaves erecto-patent lanceolate acute: their margins plane serrated, Theca erect cylindrical destitute of an apophysis
 14839 Stems short, Leaves linear-lanceolate obtuse: their margins plane serrated principally at the extremity and at the summit of the keels, Theca nearly erect cylindrical without an apophysis
 α Fruitstalks 2 inches long, Stems simple
 β Fruitstalks very short, Stems branched

and Miscellaneous Particulars.

241. *Polytrichum*. From *πολυς*, many, and *τριχον*, hair, on account of the numerous hairs of the calyptra. Easily distinguished by the rigidity of the leaves and the square form of the theca, which is keve-

History, Use, Propagation, Culture,

rally covered by a very hairy calyptra : this organ is in some species smooth, by which character they have been distinguished by the accurate Ehrhart, under the name of Catharinae; but Dr. Hooker is of opinion that the genus is not tenable.

2242. *Anictangium*. From *ανικτος*, open, and *αγγειον*, a vase, on account of the open nature of the theca, which is not enclosed by a peristome. The only British species are two plants with nerveless leaves, and the habit of *Trichostomum*.

2243. *Fissidens*. From *fissus*, split, and *dens*, a tooth, in allusion to the structure of the peristome. Plants generally referred to *Dicranum* by British botanists, but differing from that genus entirely in habit, and sufficiently in characters. Dr. Hooker remarks, that the structure of their leaves is highly curious, and totally unlike that of any other plant with which he is acquainted. Besides being vertical, their upper half (taking the nerve for the line of separation) is, from the base beyond the middle, composed of two equal lamellæ, the lower part of which embraces the stem, and the rest very often embraces a portion of the leaf placed immediately above it.

2244. *Leucodon*. Named from *λευκος*, white, and *οδους*, a tooth, from the color of the peristome. The only British species has occasionally been thrown among the *Dicrana*, *Trichostoma*, and *Pterogonia*; from any of which, an attentive consideration of the lateral fruit, deeply divided teeth, and dimidiated calyptra, will keep its genus distinct. The stems are long, and creeping over the bark of trees.

2245. *Fontinalis*. From *fons*, a fountain, in allusion to the places where it grows. *F. antipyretica* is a common plant, floating in large masses in rivers and pools of water. The specific name was given it because

- 14840 Stems short, Lvs. lin. lauc. : marg. serrat. principally at extrem. as well as summit of keels, Theca nearly erect subglobose
[erect subglobose]
- 14841 Leaves ovate much lengthened out and diaphan. at points : those of perichæcium lacinated at extremity
- 14842 Leaves ovato-acuminate colored at the points : those of the perichæcium serrated at the extremity
- 14843 Fruitstalks terminal, Perichæcial leaves resembling the cauline ones
- 14844 Like the last, but theca drooping
- 14845 Fruitstalks lateral, Perichæcial leaves ovate slightly convolute pointed
- 14846 Fruitstalks radicular, Perichæcial leaves ovate sheathing involute pointed
- 14847 Leaves closely imbricated ovate-cordate acuminate striated, Theca oblong
- 14848 Leaves nerveless for the most part complicato-carinate
- 14849 Leaves nerveless plane or very slightly concave
- 14850 Leaves furnished with a nerve slightly concave
- 14851 Lvs. ov. acum. serrul. : the nerve disappear. below point, Fruitst. twice as long as perichæcium, Theca ov
- 14852 Leaves ovato lanceolate obtuse entire : the nerve reaching to the point, Fruitst. very long, Theca cylind.
- 14853 Lvs. ovato-acum. slightly conc. : marg. recurv. Fruitst. scarcely longer than perichæ. lvs. Theca oblon.-ov.
- 14854 Leaves oblong acuminate transversely rugose, Fruitstalks much exserted, Theca ovate
- 14855 Lvs. bifar. ov. lauc. transversely undul. serrul. at point, Theca ovate subsess. shorter than perichæcial lvs.
- 14856 Leaves oblongo-lanceolate, Fruitstalks long, Calyptra fimbriated at the base
- 14857 Leaves broadly ovate acute, Theca sessile impressed, Calyptra nearly entire

- 14858 Leaves broadly ovate entire obtuse nerveless
- 14859 Lvs. ov. acuminul. margin. very obscure. serrat. at extrem. with 2 nerves nearly reach. their whole length
- 14860 Lvs. broadly scymitar-shaped serrat. at point : nerve reach. to middle of leaf, Theca ovate erect, Lid vest
- 14861 Leaves oblong apiculate entire nerveless, Theca ovate erect, Lid rostrate

and Miscellaneous Particulars.

it is employed by the Swedes to fill up the spaces between the chimney and the walls, and thus, by excluding the air, to prevent the action of fire.

2246. *Anomodon*. So called by the authors of *Muscologia Britannica*, on account of the peculiar nature of the peristome, which has narrow fringed processes arising from the very same range, and from between the teeth ; *anomos*, irregular, and *odus*, a tooth. The stems are dark, almost blackish green, long, cylindrical, and straggling. It is not uncommon on the wilds of Dartmoor.

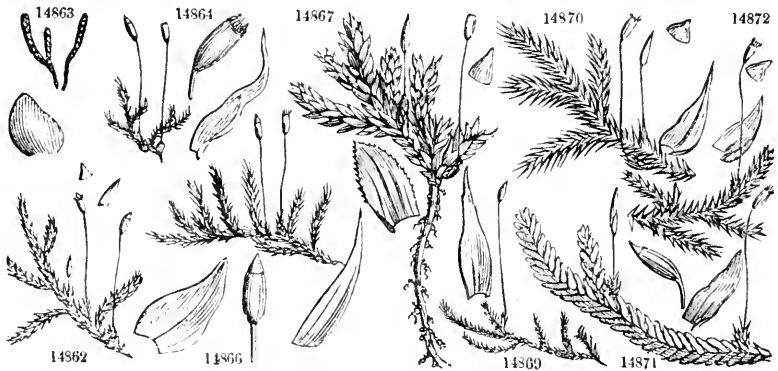

2247. *Neckera*. Named after N. J. Necker, a German botanist, who published in 1791, his *Elements of Botany*, a work which contained more useful information than many of his detractors have been pleased to allow. Beautiful mosses, found in woods and upon trees and rocks. *N. crista* has more the appearance of some fine tropical moss, than of those of our own country, where it is far from uncommon in mountainous districts, frequently covering a great extent of surface upon the trunks of old forest-trees.

2248. *Daltonia*. Named in honor of the Rev. James Dalton, a skilful English muscologist. The mitriform calyptra separates this from *Neckera*. *D. splachnoides* has only been found by the side of a streamlet on the Secawan mountain, near Dublin, where it grows sparingly in pale green tufts.

2249. *Hookeria*. This beautiful Hypnum-like genus was named by Sir James Edward Smith, in honor of Dr. William Jackson Hooker, F. R. S. &c. professor of botany in the university of Glasgow, one of the most distinguished of modern cryptogamic botanists, and a gentleman whose public reputation is only exceeded by his private excellence. The *Hookera* of Salisbury, must give way to this on every account. *H. late-virens* has hitherto been discovered only in a bog near Cork.

2250. *Leskea*. N. G. Leske was an obscure German botanist, of whom little is known, except that he gave

History, Use, Propagation, Culture,

occasion to Hedwig to name this genus after him. It has entirely the habit of the next, with which it is frequently united.

- 14862 Leaves ovate obtuse concave entire : nerve reaching to the summit, Theca cylind. nearly erect, Lid conical
- 14863 Leaves closely imbricated rotundato-ovate obtuse very concave ventricose nerveless, Theca ov. nearly erect
- 14864 Leaves loosely imbricated : the upper ones subsecund ; all of them lanceolate acuminate entire nerveless, Theca ovato-cylindrical nearly erect, Lid conical
- 14865 Lvs. erecto-pat. lanc. acuminat. ent. striat. faintly 2-nerved at base, Theca ovate nearly erect, Lid conical
- 14866 Leaves erecto-patent lanceolate acuminate entire striated ; nerve running to three fourths of the length, Theca ovate cylindrical erect, Lid conical
- 14867 Stems erect below simple and naked fasciated above, Leaves ovate more or less lanceolate striated serrat. at the point : nerve reaching nearly to the summit, Theca erect ovate cylindrical, Lid rostrate
- 14868 Stems variously branched procumbent, Lvs. all of them slightly secund broadly ovate with an attenuated obtuse point : nerve running nearly to the summit, Theca ovate cernuous, Lid conical
- 14869 Leaves 1-sided imbricated erect spreading ovate lanceolate acum. entire obscurely 2 nerved at base, Fruitst. numerous, Theca erect ovate, Lid acutely angled

* Stems plane.

- 14870 Lvs. ov.-lanc. acuminat. ent. : the nerve reaching nearly to summit, Theca oblong cernuous, Lid conical
- 14871 Lvs. ov. ac. transversely undulat. with two faint nerves at base, Theca obl. furrow. arcuato-cern. Lid rostr.
- 14872 Leaves ovate sometimes approaching to lanceolate more or less acuminate having two short nerves at the base, Theca oblongo-cylindrical inclined, Lid conical
- α Leaves ovate lanceolate distant quite plane
- β Leaves ovate more or less obtuse slightly concave

** Leaves spreading on all sides of the stem.

- 14873 Lvs. fascicul. erect lanceolato-subul. ent. : nerve reaching to summit, Theca ovate cernuous, Lid rostrate
- 14874 Leaves ovato-lanceolate rather obtuse patent entire : their nerve for the most part reaching to the summit, Theca cylindrical curved cernuous, Lid conical
- 14875 Leaves lanceolate acuminate serrated : margin slightly reflexed : nerve reaching to the point, Theca ovate nearly erect, Fruitstalks rough, Lid conical
- 14876 Leaves cordato-acuminate serrated : their nerve reaching to the point ; their margin slightly reflexed, Theca ovate cernuous, Fruitstalks rough, Lid conical
- 14877 Leaves loosely imbricated rotundato-ovate obtuse concave entire faintly two-nerved at the base or with one short nerve, Theca ovate cernuous, Lid conical
- 14878 Leaves closely imbricated nearly erect elliptical apiculate concave entire faintly two-nerved at the base, Theca ovate cernuous, Lid conical
- 14879 Leaves subpatent ovate subacuminated papillose on the back and margin with a very short nerve, Theca ovate inclined, Lid conical acuminated
- 14880 Leaves loosely imbricated erecto-patent oblongo-ovate obtuse entire : their nerve reaching half way, Theca oblongo-ovate curved cernuous, Lid conical
- 14881 Leaves nearly erect imbricated oval with a very short point concave entire : nerve reaching about half way up, Theca ovate cernuous, Lid rostrate
- 14882 Leaves closely imbricated oval with a very short point very concave : their nerve reaching half way up, Theca ovate cernuous, Lid conical
- 14883 Leaves loosely imbricated, the upper ones falcate secund ; all of them lanceol.-subul. scarcely serrated at their points : their nerve reaching more than half way, Theca ovate obl. curved cernuous, Lid conical
- 14884 Leaves erecto-patent. the upper ones sometimes secund ; all of them ovato-lanceolate acuminate sub-serrated : the nerve reaching above half way, Theca ovate cernuous, Lid conical
- 14885 Lvs. nearly erect lanc. acum. serrul. tow. end : nerve disappear. beyond end, Theca cern. Lid acute conical
- 14886 Leaves erecto-patent lanceolate acuminate entire striated : nerve disappearing below the point, Theca ovate cernuous, Fruitstalks rough, Lid conico-acuminated
- 14887 Leaves erecto-patent narrow lanceolate acuminate nearly entire striated : nerve running nearly to the summit, Theca oblongo-ovate curved cernuous, Fruitstalks smooth, Lid conical
- 14888 Leaves erecto-patent ovato-lanceolate acuminate striated entire : nerve reaching half way up, Theca ovate cernuous, Fruitstalks smooth, Lid conical
- 14889 Stems erect below simple and naked, fasciated above, Leaves concave ovate ellipt. acute serrated : nerve running nearly to the point ; marg. reflexed, Theca ovate cernuous, Lid rostrate
- 14890 Branches fasciated curved, Leaves ovato-elliptical concave serrated at the points : nerve disappearing beyond the middle, Theca ovate erect, Lid rostrate
- 14891 Stems tripinnate, Leaves ovate with a suddenly acuminate serrated point concave faintly two-nerved at the base : margin below recurved, Theca ovate cernuous, Lid rostrate
- 14892 Stems tripinnate, Leaves serrated papillose on the back : the cauline ones cordato-acuminate striated with a nerve running nearly to the point ; those of the branches more ov. with a sing. or double nerve at base
- 14893 Stems subpinnate, Leaves distantly placed patent cordate or ovate acuminate serrated : nerve disappearing below the summit, Theca ovate cernuous, Lid rostrate

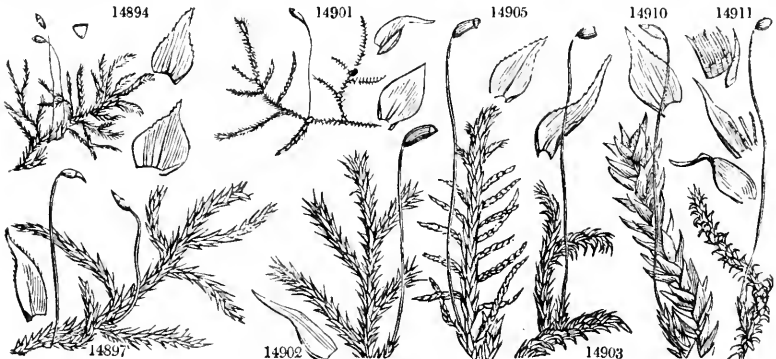

and Miscellaneous Particulars

2251. *Hypnum*. One of the names of moss among the Greeks was *ὑψιν*. This is the most extensive genus among mosses, and is readily known by its prostrate pinnated bright green branches, which form a thick mat.

History, Use, Propagation, Culture,

like covering to the surface on which they grow. *H. crista-castrensis* is at once the most beautiful and most rare of British species.

2252. *Andreea*. Named by Hedwig, in honor of J. G. R. André, a German botanist, author of Letters upon Switzerland. There was also a Portuguese Andreas de Castro, who published in 1636, a work upon plants. He was physician to one of the dukes of Braganza. There was besides a celebrated physician of antiquity

- 14894 Stems pinnate (or irregularly bipinnate), Leaves thickly set cordato-acuminate serrated very faintly two-nerved at the base, Theca oblong cernuous, Lid conical
- 14895 Stems pinnate, Leaves serrated papillose on the back: the margins reflex.; nerve running nearly to the point; and the cauline ones cordato-acuminate: those of branches cord. ac. Theca cylind. inclin. Lid rostr.
- 14896 Stems pinn. Lvs. serrated smooth on the back: marg. reflexed; cauline ones cordato-acute with a short nerve, those of branches ovate acum. with nerve disappear. bey. midd. Theca cylind. inclin. Lid conical
- 14897 Stems somewhat pinnate, Leaves ovate with a long narrow acumination serrated: nerve disappearing below the middle, Theca ovate cernuous, Lid rostrate
- 14898 Stems variously branched, Leaves patent ovate acuminate serrated at the points striated: their nerve reaching half way, Theca ovate cernuous, Fruitstalk rough, Lid conical
- 14899 Stems variously branched, Leaves erecto-patent ovate often approaching to lanceolate acuminate serrated striated: nerve reaching half way, Theca ovate cernuous, Fruitstalks rough, Lid conical
- 14900 Stems pinn. Branches short erect, Lvs. all recurv. cord. acum. obsol. 2-nerv. at base, Lid obtusely conical
- 14901 Stems somewhat pinnate, Leaves serrulate two-nerved at base: primary cordate acuminate; of branches broad ovate, Theca ovate cernuous, Lid conical
- 14902 Leaves loosely set squarrose cord. much acuminate ent. nerved. Theca oblongo-ov. curv. cern. Lid conic.
- 14903 Leaves recurved squarrose lanceolate much acuminate concave serrated striated faintly two-nerved at the base, Theca globoso-ovate cernuous, Lid conical
- 14904 Leaves loosely imbricated spreading broadly ovate acute serrated concave with a nerve nearly as far as the middle, Theca ovate cernuous, Lid rostrate
- 14905 Lvs. spread. cord. acum. serrat. striat.: nerve reach. beyond midd. Theca obl. ovate cernu. Fruitst. smooth
- 14906 Lvs. erect. spread. ov. acum. concave serrat.: their nerve reach. half way, Theca ov. cernu. Fruitst. smooth
- 14907 Leaves loosely set ovate concave nerveless entire: lower squarrose; upper imbricated in a cuspidate point Theca oblong curved cernuous
- 14908 Lvs. loosely set squarr. cord.-ov. obt. concave ent.: nerve running nearly to point, Theca obl. curv. cernu.
- 14909 Lvs. loosely set squarr. cord. much acum. entire: nerve disappear. half way up, Theca obl. ov. curv. cernu.
- 14910 Lvs. squarr. cordato-acum. serrat. faintly striated with two nerves at base, Theca globoso-ov. Lid conical
- 14911 Leaves squarrose widely cordate very much acuminate and recurved serrated faintly two-nerved at the base, Theca ovato-globose cernuous, Lid conical
- *** *Leaves secund.*
- 14912 Stems subpinnate, Leaves especially the upper ones falcato-secund broadly ovate acuminate serrated; their nerve reaching to the point, Theca oblongo-ovate curved cernuous, Lid conical
- 14913 Leaves secund ovate somewhat acuminate concave entire: margins incurved above; nerve short often forked sometimes obsolete, Theca oblongo-ovate cernuous, Lid conical
- 14914 Leaves falcato-secund lanceolato-subulate concave or almost semicylind. entire: the nerve disappearing below the summit, Theca oblongo-ovate curved cernuous, Lid conical
- ♀ Leaves wider less falcate [cernuous, Lid conical]
- 14915 Lvs. falcato-secund lanceolato-subul. serrat. striat.: nerve disappearing below point, Theca cylind. curv.
- 14916 Lvs. sec. ovato-lanc. serrat. nearly plane crisp. transverse. when dry: marg. recurv.; nerve reach. half way
- 14917 Stems pinnated, Leaves falcato-secund cordate very much acuminate serrated: their margins reflexed; nerve disappearing below the summit, Theca oblongo-ovate curved cernuous, Lid conical
- 14918 Leaves secund broadly ovate ventricose obtuse ent. nerved. Theca oblongo-ovate curv. cernu. Lid conical
- 14919 Leaves loosely imbricated secund narrow-lanceolate acuminate serrated nerveless or very obscurely two-nerved, Theca subcylindrical erecto-cernuous, Lid conical obtuse
- 14920 Leaves closely imbricated more or less falcato-secund lanceolate acuminate entire, except at the points, which are usually serrated very faintly two-nerved at base, Theca cylind. erecto-cernuous, Lid conical
- 14921 Stems closely pectinated, Leaves falcato-secund ovato-lanceolate acuminate serrulate striated faintly two-nerved at the base, Theca oblongo-ovate curved cernuous, Lid conical
- 14922 Stems pectinated, Leaves falcate secund cordate acuminate serrated not striated faintly two-nerved at base, Theca oblong ovate curved cernuous, Lid conical

VAGINULATI SCHISTOCARPI.

- 14923 Stems branched, Leaves obovate, suddenly acuminate straight imbricating the stem on every side
- 14924 Stems branched, Leaves ovate gradually acuminate: the upper ones falcate
- 14925 Stems almost simp. Lvs. binc. subul. falcate secund fragile: perichaetial obl. nerved.; their marg. involute
- 14926 Stems slightly branched, Leaves loosely imbricated lanc. subfalcate secund: perichaetial similar to cauline

and Miscellaneous Particulars.

named Andreas, who was cited honorably by Pliny. This remarkable genus differs from all other mosses, in having a theca which splits into four valves, cohering at their ends by means of the persistent lid; it agrees with Sphagnum in having no fruitstalk, but in its room an elongated receptacle, and appears to be a transition from Musci to Hepaticae. This is, however, only apparent. All the species are natives of rocks or mountains, and are remarkable for their nearly black or dark brown color.

Order 6.

HEPATICÆ.

Reproductive organs of two kinds. 1. Theca without an operculum, either naked or sessile, or furnished with a veil through which they are more or less protruded. Sporules naked (c), or mixed with spiral threads (f). 2. Minute roundish or oblong bodies variously situated. Plants frondose of a cellulose structure not submersed.

This order is distinguished from Algae, with which it was formerly united, by the nature of the theca (a, b), and of the foliaceous frond (c) which is never submersed, and which bears a greater affinity to that of Musci. From

History, Use, Propagation, Culture,

2258. *Jungermannia*. Named by Ruppis, to perpetuate the memory of Louis Jungermann, a German

these Hepaticæ differ in being destitute of an operculum or lid to the theca, and, with the exception of *Marchantia* (*d*) and *Jungermannia*, of a calyptra. The order is composed of seven genera, all very different from each other, and forming an assemblage which is only natural in regard to the organs of vegetation. It does not appear possible to reconcile these of reproduction. The herbage consists of a variously dilated frond lying flat upon the substance on which it grows, generally naked, but in many *Jungermannias* covered with small leaves, which are often divided, but never really nerved, so that, in fact, they should rather be considered dilatations of the frond: the substance is generally loosely cellular, sometimes compact, as in *Marchantia*, in which Hooker asserts that pores of the epidermis exist.

2253. *Jungermannia*. Theca 4-valved, supported on a peduncle longer than the calyx. Valves free.

2254. *Marchantia*. Theca on the under surface of a common petate pedunculate receptacle. Anthers imbedded in the disk of distinct petate pedunculate or sessile receptacles.

2255. *Riccia*. Theca spherical, immersed in the frond (not opening), crowned with the style, which is alone protruded.

2256. *Anthoceros*. Theca stalked, linear, 2-valved, with a central columella to which the sporules are attached.

2257. *Targionia*. Perianth? globose, arising from the underside of the extremity of the frond, at length opening vertically into 2-valves. Theca globose, nearly sessile, included in the perianth, opening irregularly at the extremity, and filled with spiral filaments.

2258. *Sphaerocarpus*. Theca minute, spherical, seated upon obpyriform receptacles, and filled with minute sporules unimixed with filaments.

A. Leafy.

† Stipules none.

* Leaves inserted many ways.

14927 Stem creep. irregul. branch. Lvs. imbricated on all sides setae joint. straight, Fr. term. : mouth contract.

14928 Stem creep. pinnated. branch. Lvs. imbricat. on all sides setae joint. incurv. Fr. term. : mouth expanded

14929 Lvs. quadrifarious ovate closely imbricated erect acutely bifid, Theca terminal plaited at end

14930 Stem erect nearly simple filif. Lvs. dist. quadrif. ov. somew. keel. acutely bif. Fr. term. Cal. somew. plait.

14931 Lvs. quadrifarious falcato-secund lin.-lanc. bipart. : segments straight acum. Fr. terminal, Cal. ovate leafy

14932 Leaves imbricated on all sides ovate or oblong-ovate here and there lobed and angled, Fr. term. Cal. none

** Leaves bifarious.

a Leaves undivided.

14933 Leaves obovate roundish ciliate toothed subrecurved, Fruit term. and lateral, Cal. obl. compressed oblique

14934 Lvs. obl. recurv. with margin on one side and apex dentato-spinul. Fr. lat. and axill. Cal. round. compr.

14935 Stem erect flexuose nearly simple, Lower leaves smaller ovate entire: upper rounded-ovate or nearly square, with one or more spiniform teeth

14936 Stem erect nearly simple filiform flexuose, Leaves closely imbricated nearly horizontal oblong ovate concave 2-toothed at end falcate 1-sided

14937 Leaves elliptical ovate, Fruit terminal, Cal. oblong ovate acuminate: mouth contracted denticulated

14938 Leaves spreading ovate-rounded, Fruit terminal, Cal. oblong cylindrical depressed and flat at the extremity: mouth much contracted cut and toothed

14939 Lvs. erect concave cord. circumvol. Fr. term. and axill. Cal. obl. ov. subplicate: mouth minute toothed

14940 Lvs. orbicul. Fr. upon short prop. branches, Cal. obl. attenuat. at each extrem.: mouth contracted toothed

14941 Lvs. orbicular margin. Fruit term. Cal. obov. compressed longitudin. quadrang.: mouth contract. toothed

14942 Stem ascending simple, Leaves orbicular, Fruit terminal, Cal. obl. ovate cylind. quadri. Theca spherical

14943 Stem ascending flexuose dichotomous, Leaves rounded somewhat wavy, Fruit terminal, Cal. ovate angul.

with a contracted 4-toothed orifice

14944 Stem erect divided, Leaves orbicular: upper reniform appressed, Fruit terminal, Cal. immersed oblong fleshy with an open 4-toothed orifice

b Leaves emarginate or bifid: segments equal.

14945 Leaves loosely imbric. spreading obovate emarginate, Fruit term. Cal. ovate toothed immersed in lvs.

14946 Leaves very closely imbricated erect concave ovate obtuse emarginate, Fruit terminal, Cal. O

14947 Leaves closely imbric. erect or spreading cordate ovate plane notched at extremity: their marg. recurv.

14948 Lvs. roundish concave acutely bifid: segm. straight obt. Fruit term. Cal. obpyrif.; mouth contract. tooth.

14949 Leaves spreading subquadrate deeply emarginate, Fruit terminal, Cal. oblong: mouth plaited toothed

14950 Leaves spreading subquadrate obtusely and broadly emarginate: their sides incurved, Fruit terminal, Cal. oblong: mouth contracted plaited toothed

History, Use, Propagation, Culture,

bourhood of Altdorf, and a work called *Cornucopia Floræ Giessensis*. A genus of obscure plants, forming by their creeping stems little patches upon trees or rocks, or on the earth in damp places. The British

- 14951 Stem procumbent flexuose branched in a starry manner, Leaves broad-ovate acutely 2-parted : segments folded together with spiny teeth, Fruit terminal
 14952 Lvs. subquad. acutely bifid : segm. acute straight ent. Fruit terminal, Cal. obl. plaited : mouth toothed
 14953 Leaves subquadrate obtusely bifid : segments acute, Fruit terminal, Cal. oblong plaited : mouth toothed
 14954 Lvs. orbicul. concave at extrem. lunul. emarg. Fruit term. upon short prop. central branches. Cal. obl. ov.
 14955 Lvs. round. very conc. bif. : segm. long acuin. incurv. Fr. term. upon short prop. branch. Cal. obl. subplaited
c Leaves 3-4-fid : segments equal.
 14956 Stem prost. nearly simp. Lvs. round. square : lower bifid ; upp. 3-4-fid, Fr. term. Cal. obl. ov. somew. plait.
 14957 Leaves subquadrate waved subtrifid ; segm. equal here and there toothed, Fruit terminal, Cal. obovate
 14958 Leaves spreading horizontally quadrate waved obtusely bitricrenate, Fruit terminal, Cal. campanulate, Theca spherical bursting irregularly
 14959 Leaves bitarious closely imbricated erect quadrate quadrifid : their inferior angles here and there spinul. toothed, Fruit terminal and lateral, Cal. oblong plicate : the mouth open
d Leaves bifid : segments unequal folded together.
 14960 Lvs. unequally 2-lobed $\frac{1}{2}$ -bifid tooth cili. Lobes fold. together : lower ones larger obov. ; upp. subcord. obt.
 14961 Stem erect nearly simple, Leaves unequally 2-lobed as deep as base : tooth ciliated, Lobes folded together
 14962 Lvs. uneq. 2-lob. Lobes folded together serrated at extrem. acute : lower ones larger ov. ; upp. round. ov.
 14963 Leaves unequally 2-lobed wavy entire, Lobes roundish folded together ; lower ones largest, Fruit term. Cal. oblong incurved compressed
 14964 Leaves roundish nearly equally 2-lobed entire, Lobes folded together, Fr. term. Cal. obl. incurv. compres.
 14965 Leaves unequally 2-lobed folded together with a pellucid line in the middle serrated at the extremity
 Fruit terminal, Cal. obovate cylindrical
 14966 Lvs. unequally 2-lobed folded together obtuse entire, Fruit term. Cal. obov. : mouth contracted toothed
 14967 Lvs. unequally 2-lobed folded together narr. ov. acute, Fr. term. Cal. ov. plaited : mouth contract. toothed
 14968 Leaves horizontally spreading somewhat folded together : upper equally, lower unequally 2-lobed, All the lobes rather acute, Cal. obovate
 14969 Stem prostrate nearly simple, Leaves unequally 2-lobed, Lobes folded together : lower larger ovate concave acute ; upper minute tooth-like
 14970 Leaves imbricated on the upper side unequally 2-lobed folded together : upper lobes the larger convex bifid and toothed at the extremity
 14971 Lvs. distich. imbricat. above uneq. 2-lobed : upp. lobes larger orbicul. ; lower ov. appres. flat, Cal. truncat.

†† Furnished with stipules.

- * Leaves entire or rarely emarginate.
 Stipules broadly subulate
 14972 Leaves orbicular and ovate acuminate, Stipules broadly subulate
 14973 Lvs. all rounded, Stip. broadly subul. Fruit term. Cal. ovate compressed at the extremity truncate 2-lipped
 14974 Lvs. round concave entire and emarg. Stipules broadly subul. Fruit terminal, Cal. immersed in the leaves
 14975 Lvs. horizontal rounded quad. plane ent. and emarg. Stip. obl. bifid, Fr. upon very short proper branches
 14976 Stem creeping simple, Lvs. rather rem. cuneiform ent. or bluntly emarg. at end, Stip. minute ovate bifid
 14977 Leaves horizontal plane ovate entire, Stipules broadly ovate toothed lanc. Fr. lat. Cal. subterr. obl. fleshy
 14978 Leaves horizontal convex ovate ent. Stipules round lunate-emarg. Fruit lat. Cal. subterr. obl. fleshy hairy

** Leaves 2 or 3 cleft : segments equal.

- 14979 Leaves broadly ovate decurrent bifid at the apex : segm. very acute entire, Stipules bitrifid and lacinate
 14980 Stem creeping branched, Leaves round-ovate decurrent rarely acutely often obtusely emarginate or entire, Stipules bitrifid, Fruit terminal, Cal. ovate
 14981 Leaves round acutely emarginate : segments acute straight, Stipules large ovate acuminate with a single tooth at the base on each side
 14982 Stem nearly erect simple or branched, Leaves ovate concave acutely emarginate, Stipules minute ovate bifid, Fruit terminal, Cal. oblong cylindrical little plaited
 14983 Leaves rounded quadrate 3-4-fid, Stipules lanceolate acutely bifid : their margins lacerated
 14984 Lvs. very concave nearly hemispherical emarg. Stip. ovate lanc. obtuse, Fruit term. upon short branches
 14985 Leaves imbricated above subquadrate incurved acutely 4-toothed, Stip. broadly quad. 4-tooth. Fr. radical
 14986 Lvs. imbricat. above ov. convex obtusely trident. Stip. broadly subquad. cren. Fr. from lower part of stem

** Leaves bifid : segments unequal folded together.

a Lower segments or smaller ones flat.

- 14987 Lvs. unequal. lob. : upper lobes round. ov. nearly ent. ; lower and stip. ligulate quite entire, Fruit lateral
 14988 Lvs. unequal 2-lobed spinul. toothed : upper lobes roundish ov. ; lower ligul. Stip. obl. quad. spiny toothed
 14989 Leaves very convex unequally 2-lobed : lobes and lobules ovate bipart. fringed with long and slender ciliae
 14990 Stem procumbent bitripinnate, Leaves very convex unequally 2-lobed : upper lobes 2-parted spiny toothed ; lower very minute oblong entire
 14991 Leaves nearly flat unequally 2-lobed cut into numerous capillary segments : upper lobes 2-partite ; lower minute, Stipules subquadrate lacinate

b Lower segments or smaller ones involute.

- 14992 Stem creeping unequally branched, Leaves unequally 2-lobed : upper lobes rounded ; lower minute invol. Stipules large rounded orbiculate

and Miscellaneous Particulars.

species have been admirably illustrated by Hooker, to whose Monograph no other botanical work can be compared.

History, Use, Propagation, Culture,

2254. *Marchantia*. Named by Nicholas Marchant, in honor of his father John Marchant, the first botanist whom the Academy of Sciences of Paris admitted among its members, in 1666. Soft-leaved creeping plants, with green cellular fleshy fronds spreading over the surface of the ground in wet places. *M. hemisphærica* and *polymorpha* are often the pest of the florist, whose flower pots are overrun by them, and continually disfigured.

2255. *Riccia*. Pietro Francisco Ricci, was a Florentine botanist, who left some of his works to the academy of Florence. Little, generally floating, simple plants, of the nature of which very little is known. Only one kind has been observed in fructification, and that is of a very ambiguous character. The theca, or the organs so called, are little round bodies immersed in a cavity of the frond, and containing minute sporules.

2256. *Anthoceros*. From *ανθος*, a flower, and *κερας*, a horn, on account of the horn-like form of the theca, which old botanists considered to be the flower. Minute frondose plants, with a linear 2-valved theca, containing a columella to which the sporules are attached. In habit they resemble *Jungermannia*.

- 14993 Lvs. unequal, 2-lobed : upper lobes rounded ; lower minute invol. Stip. roundish acutely bifid, Fruit lateral
- 14994 Lvs. unequally 2-lobed : upper lobes ovate-acum. mostly curved at extremity ; lower ovate acutely bifid
- 14995 Stem creeping unequally branched, Leaves unequally 2-lobed : upper lobes hemispherical ; lower minute almost obsolete, Stipules ovate rounded bifid, Fruit lateral
- 14996 Stem creeping branched, Leaves unequally 2-lobed : upper lobes larger calyptriform ; lower bluntly square circumvolute, Fruit lateral

c Lower segments or smaller ones saccate.

- 14997 Stem creeping branched, Leaves unequally 2-lobed : upper lobes ovate spiny-serrated ; lower minute saccate generally 1-toothed at base, Fruit lateral
- 14998 Lvs. unequally 2-lobed : upper lobes ovate rounded ; lower rounded saccate, Stip. rounded flat emarginate
- 14999 Lvs. unequally 2-lobed : upper lobes ovate roundish ; lower minute obov. saccate, Stip. subquadrate emarg.

§ 2. Frondose.

† Nerveless.

- 15000 Frond obl. decumb. nerv. fleshy nearly plane above : swell. ben. ; irregularly branch. The margin sinuated
- 15001 Frond lin. nerveless fleshy compressed branched in a pinnated manner, Fruit marginal, Cal. very short

†† Nerved.

- 15002 Frond obl. submembr. dichot. costate having scattered scales on the underside, Cal. and calyptra within frond
- 15003 Frond obl. submembranous irregularly divided obsoletely ribbed : the margin entire or lobed and sinuated, Fruit from upper part of frond near the apex
- 15004 Frond lin. dichotomous membranous costate glabr. above : more or less hairy beneath and on the margin, Fruit from the lower surface of the nerve
- 15005 Frond lin. dichotomous membranous costate pubescent in every part. [of the fronds
- 15006 Frond obl. somew. branch. memb. costate : the margin nearly entire, Fruit arising from the superior surface
- 15007 Frond obl. dichotomous membranous costate with the margin entire, Fruit arising from the upper surface of the frond

- 15008 Recept. of thecæ deeply cut in a stellated manner into about ten narr. segm. : that of the anthers pedunculat.
- 15009 Recept. of thecæ hemispherical cloven into about 5 oval segments
- 15010 Recept. of thecæ entire conical ovate somewhat angular : that of the anthers sessile
- 15011 Recept. of thecæ hemispherical half 4-cleft of 4 cells

- 15012 Frond small obl. somew. divid. : the segments 2-lobed at the end fleshy glaucous dotted on the surface
- 15013 Frond triangular cordate covered with long linear lanceolate segments on one side
- 15014 Frond membranous dichotomous, Lobes retuse
- 15015 Fronds membranous lobed pellucid, Theca beneath the sinuses of the lobes solit. exerted turbinate tooth.

- 15016 Fronds bipinnatifid linear
- 15017 Fronds multifid lobed sinuated, Theca subulate half bifid
- 15018 Fronds lobed rounded flat, Theca short

- 15019 Frond flat imbricated lobed, Lobes rounded retuse

- 15020 Frond simple ovate, Thecæ pyriform clustered at the base of frond

and Miscellaneous Particulars.

2257. *Targionia*. So called in remembrance of John Anthony Targioni, a meritorious Florentine botanist, who published in 1734 a work for the purpose of shewing the importance of botanical lectures, with reference to a course of studies in medicine. There was also another Florentine physician called John Targioni Tozzetti, after whom *Tozzettia* has been named. This genus consists of only one species, which is frondose and lobed. The theca is concealed and almost sessile within the involucre, globose, bursting at the apex, and discharging its sporules mixed with spiral filaments. This genus is very near *Jungermannia*.

2258. *Sphaerocarpus*. From *σφαῖρα*, a globe, and *καρπός*, fruit, in allusion to the form of the fruit. The plant consists of a roundish delicate membranous frond, bearing on its disk a cluster of obpyriform receptacles, each of which has a globose transparent finely membranous seed-vessel, filled with minute sporules unmixed with elastic filaments.

Order 7. ALGÆ.

Reproductive organs of two kinds. 1. Thecae or tubercles variously situated. 2. Sporules or granules naked or immersed in the frond. Plants always aquatic and submersed.

This order is constituted of the sea-weeds of our ocean, and of the floating scum-like substances of our ditches and rivers. Little is known of the functions which what are called their reproductive organs perform. The nature and structure of those organs are so various as to render it improbable that they should all be destined for the same purposes. The bodies which are called sporules are variously situated; now filling distinct thecae (a), or even tubercles (b), which are either free (b, c, d), or imbedded in the substance of the frond (e, f); now appearing to be naked and surrounded by an involucre (g); now scattered or arranged in some determinate manner in the interior of the frond. (h) The fronds are either cylindrical (i), or plane (j), sometimes little more than a mere membrane, sometimes hard and horny, and extended to the length of many feet. Many are articulated (k, l); their line of separation is then called a joint, and the space between two joints an articulation.

Professor Agardh, of Lund, one of the most celebrated of modern cryptogamists, and whose disposition of Algae is adopted here, in his latest work, called *Systema Algarum*, published at Lund, in 1824, defines the order thus:

"Aquatic plants destitute of cotyledons and of sexual organs; gelatinous, membranous, or coriaceous; filamentous, laminose, or even leafy; in color green, purple, or olivaceous; jointed or continuous; bearing sporidia" (little transparent bodies containing sporules), "either included in pericarps or scattered over the surface."

The Algæ form one of the three forms of the lowest order of vegetation, Lichens and Fungi the two other. Of the former, many are considered by some botanists to be animalcula, and others, to be the young seedling plants of mosses.

TRIBE I. DIATOMEÆ.

Bodies of various forms, flat and crystalline, and separating into fragments.

2259. *Achnanthes*. Frond stalked, vexilliform. *Marine*.
 2260. *Diatoma*. Filaments jointed, hyaline, rigid, simple, united in pairs longitudinally, at length separating into articulations cohering by their alternate angles.
 2261. *Fragillaria*. Filaments jointed, simple, gelatinous, compressed, fragile, separating at the joints.
 2262. *Cladoseira*. Filaments jointed, contracted at the joints, very fragile, and easily separating.
 2263. *Desmidiium*. Filaments transversely and densely striated, mucous, flexible, green, half separated into articulations, and in that state pinnatifid.
 2264. *Schizonæma*. Filaments bead-like, composed of narrower cohering filaments inclosing elliptical granules, into which they are finally dissolved. *Marine*.

TRIBE II. NOSTOCHINÆ.

Individuals numerous, globular or filiform, suspended in a gelatine of a definite form.

2265. *Palmetta*. Minute or small, somewhat diaphanous gelatinous plants, filled with solitary granules unimixed with filaments.
 2266. *Echinella*. A roundish gelatine crammed with elliptical radiant corpuscles. *Marshy*.
 2267. *Alcyonidium*. A spongy fleshy lobed frond filled with granules. *Marine*.
 2268. *Nostoc*. Plants roundish or shapeless, gelatinous. Substance composed of curved moniliform simple filaments, lying irregularly in a gelatinous nidus.
 2269. *Corynephora*. A gelatinous roundish puckered frond filled with jointed filaments, bearing here and there clavate processes.
 2270. *Rivularia*. A gelatinous subglobose frond filled with filaments, radiating from a common centre, continuous, placed on a globule, and marked with annulations inside.
 2271. *Chatophora*. Plant elongated or globose gelatinous. Substance composed of branched articulated filaments.
 2272. *Scythymenia*. A coriaceous tough stratum, formed of fibres and granules mingled together.

TRIBE III. CONFERVOIDÆ.

Filaments jointed either externally or internally, separate, and not combined in any definite form.

2273. *Byssocladium*. Filaments like cobwebs, scattered externally with sporidia. *Slightly inundated*.
 2274. *Mycinema*. Filaments membranous, opaque, tenacious, colored (usually tawny). *Slightly inundated*.
 2275. *Chroolepus*. Filaments rigid, nearly solid, opaque, crumbling into powder, torulose. *On rocks or bark*.
 2276. *Trentepohlia*. Filaments flexible, colored, bearing capsules, which generally proceed from the last articulation, which is inflated. *Inundated or fluviatile*.
 2277. *Seytonema*. Plant not gelatinous, coriaceous. Filaments short, forming dark dense tufts, beaded internally, or filled with annular transverse bodies. *On rocks or inundated, rarely marine*.
 2278. *Sligonema*. Filaments continuous, coriaceous, naked, marked inside with dots disposed in rings. *On rocks*.
 2279. *Protonema*. Filaments somewhat jointed, rooting very minute.
 2280. *Hygrocrocis*. Filaments hyaline, arachnoid, obsoletely articulated, floating in a shapeless gelatine or in a colored membrane.
 2281. *Leptomitus*. Filaments hyaline or slightly colored, arachnoid, obsoletely articulated, separate, erect, not entangled.

2282. *Mesogloia*. Frond filiform, cylindrical, gelatinous, with compact somewhat moniliform branches radiating from a medullary pith, and bearing capsules.
2283. *Batrachospermum*. Frond filiform, gelatinous, sending out from the primary filament moniliform gemmiferous branches.
2284. *Draparnaldia*. Filaments green, jointed, very gelatinous. Ramuli penicillate fascicled. Fructification a granular mass in the articulations of the main filaments.
2285. *Oscillatoria*. Plants gelatinous. Filaments simple, continuous, membranaceous, filled internally with transverse parallel striæ.
2286. *Calothrix*. Filaments destitute of a mucous matrix, stiffish, straight, motionless, with a continuous tube annulated inside.
2287. *Lyngbya*. Filaments without a mucous matrix, freely floating, flexible, motionless, with a continuous tube annulated inside.
2288. *Bangia*. Filaments capillary, mostly simple, tubular, continuous. Fructification; granules disposed in regular transverse series or strat.
2289. *Zygnema*. Filaments jointed, simple, gelatinous, compressed, fragile, separating at the joints.
2290. *Mougeotia*. Filaments articulated, connected like a net, with irregularly placed granules, and these attached to the angles of the meshes.
2291. *Hydrodictyon*. Filaments articulated, connected like a net. Articulations viviparous, including young individuals.
2292. *Conferva*. Filaments uniform, jointed, membranaceous, simple or branched, mostly green. Fructification, granules scattered in the articulations. *Salt and fresh water.*
2293. *Bulbochete*. First filament articulated, sending out from the apex of the articulations an accessory branchlet. These alternating with the accessory branches. *Marshy.*
2294. *Nitella*. Filaments consisting of a single tube, membranous, jointed, with whorled branches. Organs of fructification twofold and separate; first nucleus spirally striated, without bractes, and not crowned; second, colored globules. *Sea and marshes.*
2295. *Chara*. Filaments spirally striated, jointed, with whorled branches. Organs of fructification twofold, and close together; first, nucleus spirally striated, furnished with bractes, and crowned; second, colored globules. *Sea and marshes.*
2296. *Ceramium*. Filaments jointed, subdichotomous, red, articulations veined or diaphanous. Fructification; capsules with an involucre of short ramuli. *Marine.*
2297. *Griffithsia*. Filaments jointed, rose red, branched. Articulations marked with one broad tube-like line, the joints pellucid. Fructification; pedunculated capsules on the ramuli. *Marine.*
2298. *Chaetopora*. Filaments obsolete articulated, rosy, covered by axillary articulated fruit-bearing branches, which either include in the middle a globe of sporules, or change to a lanceolate receptacle covered with setæ, among which the sporules nestle. *Marine.*
2299. *Polysiphonia*. Filaments jointed, longitudinally striated, with internal parallel tubes. Fructification; double ovate capsules, and granules in swollen branchlets. *Marine.*
2300. *Rytiphlea*. Frond flattened, distichous, transversely striated, becoming black when dry, with incurved ramenta. Fruit twofold; first, spherical capsules with pyriform sporidia; and second, lanceolate pods with roundish sporidia. *Marine.*
2301. *Ectocarpus*. Filaments jointed, much branched, fuscous. Fructification; lanceolate pods or ovate capsules solitary or racemose. *Marine.*
2302. *Sphacellaria*. Filaments jointed, branched, olivaceous, distichous or dichotomous; apex of the branches sphaclellate or hyaline, abrupt. Fructification; granules in the sphaclellate apex, or capsules. *Marine.*
2303. *Cladostephus*. Plant olivaceous. Main filaments opaque, inarticulate; branches jointed, mostly whorled with ramuli. Fructification; capsules. *Marine.*

TRIBE IV. ULVACEÆ.

- Frond membranous, continuous, tubular or flattened, never ribbed, herbaceous, or very rarely purple. Fruit a heap of sporules, either naked, or forming scattered granules covered by coniocystas.*
2304. *Faucheria*. Filaments dichotomous or irregularly branched, somewhat rigid. Fructification; a granulated mass within the frond, and external dark vesicles variously situated.
2305. *Codium*. Frond spongy, of a determinate figure formed of filaments densely packed, which are tubular and continuous, and colored by a granular green powder. Coniocystas clustered at the surface of the frond.
2306. *Bryopsis*. Root minutely scutate. Filaments tubular, continuous, aggregated, branched, pinnate, or imbricated upwards with branchlets. Fructification a dark internal granular mass.
2307. *Solenia*. Frond tubular, membranous, with a striated areolated surface. Sporidia very minute and compact.
2308. *Ulva*. Root scutate. Frond plane, ribless, flabelliform or wedge-shaped, or linear and dichotomous. Fructification naked immersed; granules distributed in fours throughout the frond.
2309. *Porphyra*. Frond flat, purple, with the membrane of equal texture. Fruit twofold; first, sori of oval sporidia collected in a disorderly manner; second, two parallel lines marked on each side by a globule.

TRIBE V. FLORIDEÆ.

- Frond coriaceous or rarely membranous, flat or filiform, continuous, purple or pink. Sporidia purple, included in capsules or clustered in sori.*
2310. *Polyides*. Frond filiform, fastigate, cartilaginous, softish, composed of radiating fibres. Fruit, spongy warts composed of fibres supporting sporidia.
2311. *Pilobota*. Root scutate. Fronds compressed or plane, pinnate. Fructification; a cluster of naked granules surrounded by a linear cleft involucre.
2312. *Rhodonecta*. Frond either flat or foliaceous, and somewhat ribbed or filiform. Fruit twofold; first, lomenta filled longitudinally with globules of sporaceous matter; second, capsules with a few pyriform sporidia sessile in the capsule (blackish when dry).
2313. *Chondria*. Frond continuous, gelatinoso-cartilaginous. Fructification double; naked granules immersed in the substance of the ramuli and external tubercles.
2314. *Sphaerococcus*. Root scutate. Frond submembranaceous or cartilaginous. Fructification uniform; tubercles or capsules.
2315. *Halymenia*. Frond flat or tubular, somewhat membranous. Fruit, dot-like tubercles half immersed in the lamina of the frond.
2316. *Bonnemaïsonia*. Frond filiform, compressed, pectinate, ciliated. Fruit, capsules with pyriform sporidia fastened together in a chain-like manner.
2317. *Delesseria*. Root scutate. Frond plane, membranaceous, with or without ribs. Fructification double, tubercles and clusters of naked immersed granules.

TRIBE VI. FUCOIDEÆ.

- Frond coriaceous, rarely membranous, continuous, olive-green, flat or filiform. Sporidia black, included in capsules, which are either ovate, and surrounded by a hyaline border, and nesting in a peculiar receptacle, or pyriform, and immersed in the frond.*
2318. *Lemanea*. Frond filiform, torulose, tubular. Chains of spore adhering to the inner surface of the filament, pencilled moniliform. *In fresh water.*

2319. *Chordaria*. Root scutate. Frond filiform of an olive color and cartilaginous substance. Fructification; clavate, pyriform, concentric filaments constituting the whole frond.
2320. *Scytosiphon*. Root scutate. Frond filiform, tubular, subcoriaceous. Fructification; naked pyriform granules covering the whole frond.
2321. *Sporochnus*. Root mostly scutate. Frond plane, with distichous branches, bearing, in most instances, delicate pencil-like deciduous tufts of confervoid filaments. ("Receptacles composed of concentric, clavate, articulated corpuscles.")
2322. *Hakisera*. Frond flat, linear, ribbed, membranous. Capsules heaped in sori.
2323. *Encelium*. Frond tubular or bladderly, dotted. Fruit, the tips of the frond filled with a black sporeous matter.
2324. *Zonaria*. Root downy. Frond plane, ribless, flabelliform or wedge-shaped, or linear and dichotomous. Fructification, adnate tubercles collected into parallel lines on the frond.

History, Use, Propagation, Culture,

2229. *Achnanthes*. From *αχνη*, the froth of the ocean, and *ανθος*, a flower. Marine productions, separating into fragments, but by degrees. In the middle of each articulation are one or two crystalline points.

2230. *Diatoma*. From *διατομος*, incision, in allusion to the curious manner in which the filaments are divided into joints cohering alternately by their angles.

2231. *Fragillaria*. So named on account of their fragile nature, which is more remarkable than that of other *Confervæ*. The filaments when complete are flat and composed of little fragments glued together crosswise. These are very narrow, and when once separated do not cohere again.

2232. *Meloseira*. From *μελος*, a membrane, and *σειρα*, a chain, with reference to the form of the filaments. This genus differs from the last, as *Conferva* from *Oscillatoria*.

2263. *Desmidiium*. From *δεσμος*, a bond, in allusion to the singular manner in which the parts cohere when in a state of dissolution. At that period the articulations become half separated one from the other in such a way as to represent a pinnatifid appearance.

2264. *Schizonema*. From *σχιζω*, to divide, and *νημα*, a filament; the filaments are finally divided into compound granules. These plants have entirely the habit and flexible substance of *Conferva*. When fresh they are sparkling and brown, when dry olive-green, and very shining. They are composed of many filiform individuals, which include nearly the same corpuscles as are visible in the foreign genera *Frustulia* and *Meridion*.

15025. *Laminaria*. Root fibrous. Stipes dilated into a plane frond. Fructification, naked granules immersed and forming irregular groups in the frond.

15026. *Lichina*. Fronds minute, tufted, greenish-black when growing. Fructification solitary tubercles with a pore, at length scutelliform.

15027. *Porcellaria*. Frond cylindrical. Fructification concealed in the swollen extremities of the frond, capsules in the centre, and pyriforme granules in the circumference.

15028. *Fucus*. Root scutate. Frond plane or compressed, (rarely filiform) dichotomous. Fructification, tubercles contained in a common mucose receptacle, and filled with spores and filaments.

15029. *Cystoscira*. Root scutate. Stipes cylindrical. Lower leaves plane, upper ones filiform, furnished with pinnate vesicles. Fructification, tubercles in common receptacles, the receptacles with several loculements.

DIATOMEÆ.

15021 Articulations with one dot, Stem long

15022 Filaments striated, Articulations nearly equal in diameter with parallel striæ

15023 Articulations half as long again as wide granular transversely

15024 Filaments greenish, Articulations square striated

15025 Filaments arcuate transversely striated, Articulations nearly square with pellucid joints

15026 Articulations half as long again as wide oblique marked with a pellucid transverse band and a dot

15027 Filaments tapering very rigid with parallel transverse dense striæ

15028 Filaments tapering orange-colored, Articulations twice as short as their diameter

15029 Filaments unequal containing nearly circular moniliform globules in rows

15030 Joints contract. Articulations transversely striat. with 1 or 2 very fine lines about 3 times as long as wide

15031 Articulations shorter than broad finally changed into somewhat oval close moniliform heaps

15032 Filaments after copulation pinnatifid traversed by a longitudinal green streak, Articulations 2-toothed

15033 Filaments somewhat branched caespitose acute, Granules parallel clustered

15034 Filam. somew. branched caespitose acute, Granules clustered appressed, Membrane of filam. inconspicuous

15035 Filaments densely branched virgate, Granules elliptical

15036 Filaments minute continuous erect branched containing cylindrical oblong scattered granules

15037 Filaments slender erect dichotomous, Branches swollen here and there into roundish knobs: interior gelatinous with numerous cylindrical oblong granules

NOSTOCHINÆ.

15038 Frond thick angular-lobed, Granules elliptical

15039 Fronds aggregate minute globose, Granules globose

15040 Frond deformed rugose, Granules globose brown

and Miscellaneous Particulars.

15045. *Palmella*. Apparently a diminutive of *Palma*, a little palm; but the application of the name is not obvious in that sense. The plants are found in marshy or inundated places, and consist of globules nestling in a gelatine; in which respect the genus differs from *Protococcus*, the Red Snow plant. It is supposed that many of the species are only the ova of animalcules.

The Red Snow plant, which, as we have just said, is nearly related to this genus, has not hitherto been noticed in this country, but as it has been found in many countries similar to our own regions of snow, it is so probable that it exists in Great Britain, that we insert some particulars of it here, especially as it may be considered to have been introduced at least in 1819, by Captain Ross's expedition to the North Pole. When viewed under the highest powers of a simple microscope, it appears to consist of globules containing a red fluid. We select the following observations upon its history, from a communication made to the *News of Literature and Science*, on the twenty-first of January, 1826.

"Our scientific readers will remember the interest which was excited on the subject of this natural production, upon the return of Captain Ross from his Polar expedition, some years since. At that time it was examined by three of the most acute observers in this country, especially of microscopical objects, Wollaston, Brown, and Bauer, who all formed a similar conclusion in one respect, that it was of vegetable origin, but were of different opinions as to its precise nature: Dr. Wollaston supposing it to be the seed of a moss; Mr. Brown, a substance belonging to Algæ, and nearly related to *Tremella cruenta*, a common British plant; and Mr.

History, Use, Propagation, Culture,

Bauer referring it to a genus of Fungi, called Uredo. We have lately seen a curious paper upon this subject, by Professor Agardh, of Lund, whose opinions upon all matters connected with the lower orders of vegetation demand deep attention.

"That snow occasionally assumed a red color, had long been a fact of which there could be no doubt; and that water was also under particular circumstances stained with red, we have the popular traditions of showers of blood, and water changed to blood, to attest. In the year 1608, a shower of blood fell near Aix, in France, which was examined by Peiresc, and found to be caused by insects; and to the same cause was undoubtedly to be ascribed the bloody rain that fell at Schonon, in 1711, which the learned Bishop Swedberg looked upon as a supernatural phenomenon, and a direct sign of the anger of the Divinity. The red pools which are occasionally met with, even in this country, are generally stained by the presence of an immense number of animalcules, called *Daphnia Pulex*, or *Cyclope quadricornis*. The red stains sometimes seen upon the seashore are occasioned by a particular sort of *Fucus*. Professor Agardh proceeds to observe, that the red snow is very common in all the alpine districts of Europe; where it is probably, for the most part, of the same nature as that brought from the North Pole by Captain Ross. Saussure saw it in abundance upon Mount Brevern, in Switzerland, and elsewhere; Ramond found it on the Pyrenees, and Sommerfeldt in Norway. In March, 1808, the whole country about Cadore, Belluno, and Feltri, was in a single night covered to the depth of twenty centimetres with a rose-colored snow; at the same time a similar shower was witnessed on the mountains of Valtellin, Brescia, Carinthia, and Tyrol. But the most remarkable red-snow shower was that which fell on the night between the 14th and 15th of March, 1823, in Calabria Abruzzo, in Tuscany, and at Bologna, and upon the whole chain of the Apennines. We may add, that both snow and ice were seen stained with red, green, and blue, by the late expedition under Baron Wrangel to the Frozen Ocean.

"With this information before him, Professor Agardh proceeds to consider the nature of this remarkable substance, which he concludes, with Brown, to be referable to the lowest order of *Algæ*, and to stand as a distinct genus, which he calls *Protococcus*, upon the very limits of the animal and vegetable kingdoms. Saussure, indeed, from finding that the red snow of the Alps gave out, when burnt, a smell like that of plants, concluded that it was of vegetable origin; but he supposed it to consist of the farina of some plant, although he could neither account for its having ascended to such elevated regions, nor mention a plant whose farina was of that color.

"Besides the plant called *Palmella cruenta*, which is similar in its structure to the red-snow plant, other low vegetable productions have been noticed by different authors, as possessing a similar color. Such are the *Lepraria Kermesina*, which, by the way, is considered only a particular state of the red-snow plant itself, and the *Byssus cobaltina*. These are always found in situations in which they are exposed to the intense action of light, such as vast plains of snow, or masses of glittering limestone. Whence it is inferred, that the color of the red snow is attributable to the action of light, modified in some mysterious manner, by the nature of the body on which it strikes. In confirmation of which hypothesis, it is remarked, that when the *Lepraria*

15041 Minute roundish soft rose-colored containing extremely minute sporules

15042 Frond deformed rugose, Granules ovate red

15043 Frond crust-like crimson

15044 Corpuscles radiant lanceolate jointed

15045 Branches elongated

15046 Branches short obtuse

15047 Frond filiform simple

15048 Frond expanded deformed plaited wavy

15049 Frond globose watery inside, Integument coriaceous very smooth

15050 Frond globose solid smooth

15051 Frond bladdery subcoriaceous hollow plaited smooth

15052 The only species

15053 Frond hemispherical hard, Filaments very dense branched by apposition

15054 Frond globose hollow, Filaments simple

15055 Filaments intermingled with calcareous particles hard and crustaceous when dry

15056 Frond tubercular hollow, Filaments distributed in many little orls

15057 Frond linear flattish dichotomous at base much pinnated at end

β Branches very short

15058 The only species

and Miscellaneous Particulars.

Kermesina is found under stems, stones, or in crevices of limestone, where light can scarcely gain admittance, its color gradually passes from red to green.

"The only difficulty in the way of this explanation of its nature is in the statements of so many observers, that the red snow falls from the air. But Professor Agardh shrewdly remarks, that all the persons agree that it fell in the night, which is as much as to say, that no one saw it fall. He is of opinion that the *Protococcus*, or Red Snow, is called into existence by the vivifying power of the sun's light, after its warmth has caused the snow to dissolve, and accompanied by that incomprehensible power in white snow, of producing a color; and, moreover, that it first attracts the eye when there is a considerable quantity, in the same way that we do not see the color of drops of water till they have accumulated in the ocean."

226. *Echinella*. From *echinus*, an hedgehog, in allusion to the bristly appearance presented by its radiant particles. Many naturalists believe the bodies referred to this genus to be animalcula.

227. *Alcyonidium*. So called, from *αλκυονες* *Frois*, the foam of the sea, among which the plants referred to this genus are naturally produced. This also is supposed to be the nidus of animalcula. Lamouroux who originally fixed it here, afterwards referred it to *Zoophytes*; in which last opinion Gaillon agrees with him, declaring that he has actually seen the animalcula nesting in it. D'Orbigny and Ellis consider it the ova of a testaceous animal.

228. *Nostoc*. A name first used by Paracelsus, without an explanation of its meaning. Agardh thinks this singular substance changes into the genus *Collema* among the Lichens.

229. *Corynephora*. From *κωνος*, a club, and *φορος*, to bear, in allusion to the clavate filaments which are found on different parts of it. The species are found in the ocean."

270. *Ulularia*. So named on account of the places in which the species grow. They have a globose frond, of a gelatinous but toughish texture. Their color is dark green, and not as in the next genus, pale-green. The filaments are very singular, seated on a globule, simple, cylindrical, and terminated by a very fine point; they are densely compact, continuous, and filled with a green annular matter.

271. *Chatophora*. From *χατρη*, a bristle, and *φορος*, to bear; the filaments are terminated by a bristle-like point. This genus is chiefly distinguished from *Coniervoideæ* by its gelatine. The color is bright green, and the texture softer than in the preceding. The manner of propagation, which has been noticed in so small a number of Algae, has been observed by Agardh in two species of this genus. In *Chatophora pisiformis* little hard crystalline corpuscles, like grains of sand, may be seen, which separate from the mother plant and produce young filaments. But in *C. clavata*, the points of the filaments fall off and sink to the bottom of the water, where they unite by three, four, five, or by a greater number at a time, in a common point, which is first green, afterwards blackish, and apparently inorganic. From this beginning new individuals arise.

272. *Scythymenia*. Derivation unknown. A very singular plant, formerly referred to *Ulva*. It has the habit of a fungus, and grows upon damp walls. It is supposed to be most nearly related to *Palmella*.

History, Use, Propagation, Culture,

2273. *Byssocladium*. From *byssus*, a kind of fungus, and *κλαδος*, a branch; the filamentous branches of this plant being very similar to those of *Byssus*.

2274. *Mycinema*. From *μυκης*, a kind of minute fungus, and *νημα*, a thread; in allusion to the resemblance of the filaments to those of some Fungi.

2275. *Chroolemus*. So called on account of the change which is undergone by the exterior membrane which changes to powder; from *χρως*, skin, and *λεωω*, to dearticulate.

2276. *Trentepohlia*. So named, in honor of an obscure German botanist. This is an ill-defined genus, which is much in need of reformation.

2277. *Scytonema*. From *στυτος*, leather, and *νημα*, a filament; in allusion to the coriaceous nature of the filamentous frond. The species grow chiefly on stones in inundated places, and are rarely found in salt water.

CONFERVOIDÆ.

15059 Filaments appressed very minute short radiant cobweb-like branched sinuous wavy

15060 Filam. thin entangled in a cobweb-like membr. Branches scatter. rem. simp. Articulat. of various lengths
 15061 Filam. decumb. long membran. equal branched entangled in a soft layer, Articulat. thrice as long as broad
 15062 Filaments much branched rigid erect entangled in a nearly solid mass, Articulat. $\frac{1}{2}$ times as long as broad
 15063 Filam. branch. ascend. very short entangled in a dense unif. crust, Articulat. about $\frac{1}{4}$ as long again as broad
 15064 Filam. branch. dichotom. erecting very minute having caps. at end and aerugin. Disarticulations nearly obsol.

15065 Filaments caespitose erect very short dichotomous, Articulations half as long again as broad
 15066 Filaments caespitose branched short erect, Branches spreading stiffish, Articulations as broad as long
 15067 Filaments erect fasciated alternately branched rigid, Articulations tumid as broad as long
 15068 Filam. caespit. rig. short ascend. curv'd densely branched, Artic. as broad as long by a line except granules
 15069 Filaments caespitose branched erect rigid somewhat cartilaginous obtuse, Articulations as broad as long

15070 Filam. dichotomous caespitose entangled very minute, Artic. about twice as long as broad

 β Much smaller, Articulations as broad as long
 15072 Filaments virgate caespitose, Branches straight, Artic. twice as long as broad, Thexæ racemose

15073 Filaments decumbent rigid flexuose branched entangled in a crustaceous layer, Branches appressed
 15074 Filaments simple erect very short flexuose-crisp entangled in a black layer
 15075 Tuft with olive-yellow filaments, Branches double 1-sided

15076 Filaments simple erect flexuose spirally twisted into pointed masses greenish above brownish below
 15077 Tuft loose, Filaments netted branched, Branches divaricating
 15078 Tuft loose, Filaments flexuose, Branches solitary remote ascending

15079 Filaments rigid branched, Branches slender, Granules disposed in rings

15080 Runner creeping transparent emitting round green erect branches, Artic. cylindrical, Joints obsolete
 15081 Layer velvety, Filaments erect obtuse clustered brittle, Articulations gibbous
 15082 Layer velvety, Runner creeping rooting sending out erect obtuse branches, Artic. cylind. Joints obsolete
 15083 Layer velvety, Filaments erect blunt rigid, Branches alternate, Articulations oval twice as long as broad
 15084 Filaments dichotomous, Branches divaricating acuminate, Artic. thrice as long as broad
 15085 Filaments obvaceous branched blunt erect in a cushion-like tuft, Artic. about as broad as long
 15086 Filaments branched, Branches alternate divaricating subulate, Artic. three times as long as broad

15087 Tuft globose, Filaments very fine like cobweb hyaline much entangled without joints wavy branched
 15088 Filam. dichot. branch. very min. decumb. very densely entang. in a whit. layer, Artic. twice as long as broad
 15089 Filam. somewhat branched densely entangled in an olive-green pellicle, Artic. as broad as long
 15090 Filam. dichot. curv'd flexuose entangled in a coriaceous gelatin. pellicle, Axilla round, Artic. very long
 15091 Filam. hyal. somew. branch. entang. cobw.-like entang. in a pucker. cloud-like membr. or a comp. gelatine
 15092 Filam. branched densely entangled in a gelatin. pellicle, Branches divaric. Artic. half as long again as broad
 15093 Filaments hyaline entangled branched, Branches tapered acute, Artic. as long as broad

* Growing on vegetables.

15094 Filam. somew. branched minute hyaline, Branches scattered forked bluntish, Joints obsol. Artic. various
 15095 Filam. at every joint branched and clustered in a shapeless gelatinous mass, Articulations very long

and Miscellaneous Particulars.

2278. *Stigonema*. So named in allusion to the regular annular dots of the filaments; from $\sigma\tau\iota\gamma\omega\nu$, dotted, and $\nu\lambda\alpha\alpha$, a thread. This genus is similar in habit to the Lichens. The color is opaque and brown; the filaments are branched with spines, and marked internally with distinct dots.

2279. *Protonema*. It is uncertain whether this genus is not rather the young state of germinating mosses; it is named in allusion to the simplicity of its structure, from $\pi\rho\omicron\tau\omega\varsigma$, first, or primary, and $\nu\lambda\alpha\alpha$, a thread.

2280. *Hygrocrocis*. From $\gamma\gamma\rho\omega\varsigma$, any thing belonging to water, and $\chi\rho\omega\kappa\iota\varsigma$, a little tuft. These plants are found in chemical solutions of vegetable matter, as in ink, &c.

2281. *Leptomitis*. Substances floating in the water, and produced by animal matter in a state of decay. They consist of exceedingly fine intertangled filaments, whence the name, $\lambda\epsilon\iota\pi\tau\omega\varsigma$, slender, and $\mu\iota\tau\omega\varsigma$, a thread.

History, Use, Propagation, Culture,

2282. *Mesogloia*. From *mesos*, the middle, and *gloia*, viscid: the spines of little branches radiating from a common center, and forming what appears to be a solid mass. These plants were formerly referred to *Chaetophora*, from which they differ in the want of any fixed gelatine.

2283. *Batrachospermum*. From *batrachos*, a frog, and *permeum*. So called in allusion to the places in which the species grow; they are mostly found in marshes, less frequently in the sea.

2284. *Draparnaldia*. James Philip Ralph Draparnaud, was a French botanist, who wrote some memoirs on the subject of botany in the beginning of this century. He is also known for his acquaintance with freshwater *Confervæ*.

2285. *Oscillatoria*. The singular motion of these curious plants has suggested their generic name. The oscillation of the filaments seems almost of an animal nature, although it frequently arises from mechanical

15096 Filam. branched very minute, Branches and branchlets acuminate, Joints pellucid, Artic. cylindrical

** Growing on animals.

15097 Filaments simple hyaline clavate at end

15098 Frond dichotomous, Axillæ rounded: upper spreading

15099 Frond virgate with all the branches divaricating

15100 Frond somewhat moniliform virgate filiform, Branches scattered obtuse spreading

15101 Frond much branched, Branchlets tapering at each end divaricating

15102 Frond yellowish-brown, Branches divaricating

15103 Frond dichotomous cylindrical equal, Branches thickened at end

β Frond setaceous minute

15104 Frond moniliform much-branched, Branches rather acute, Cauline whorls nearly distinct globose

α Filaments thick, Whorls of stem confluent: those of the branches distinct

β Thinner bluish with distant whorls

15105 Branches simple clustered, First filament nearly homogeneous

15106 Pencils of branches lanceolate acute erect

15107 Pencils of branches ovate blunt spreading

15108 Filaments hyaline very fine tufted entangled in nearly parallel lines

15109 Filaments rigid straight entangled in a gelatinous black layer which has short rays

β Filaments twisted in bundles

15110 Filaments rigid straight entangled in a gelatinous black layer with long rays

15111 Filaments stiffish curved entangled in a compact somewhat coriaceous layer

15112 Filaments transparent rigid straight entangled in a compact brownish-violet layer with short rays

15113 Filaments very minute densely entangled: transverse striae wholly invisible

15114 Filaments stiffish straight entangled in a gelatinous green layer with short rays

15115 Filaments rigid rapidly oscillating straight entangled in a gelatinous layer with long rays

15116 Filaments covered with a deciduous crust entangled in a blue layer

15117 Filaments very slender flexuose densely interwoven into thin masses

15118 Filaments very slender simple greenish lying in a thick very tender fragile ochraceous stratum

15119 Filaments very fine rigid snow-white packed in a dull-yellow tuft

15120 Filaments glaucous erect minute subulate fasciated at base separate at end

15121 Filaments curved-wavy erect minute entangled in a dense layer

15122 Filaments stiffish erect acuminate simple at the beginning finely branched

15123 Filaments curved variously united entangled in a lax globule

15124 Filaments mucous stiffish erect branched tufted

15125 Filaments stiffish erect branched packed in a dark-green tuft

15126 Filaments stiffish curved wavy thickish with lax rings

15127 Filaments tufted fastigiate equal, Bands approximating in pairs many-dotted

15128 Filaments dark-purple straight, Bands 5-dotted

and Miscellaneous Particulars.

causes, as from the elasticity of the filaments, from the motion of minute animalcula. Agardh, however, declares that *O. curviceps* has naturally the motion of an animal, but of a creeping not oscillatory nature.

2286. *Calothrix*. From *καλοσ*, beautiful, and *τριξ*, hair, in allusion to the beauty of the entangled filaments; the latter appear as if branched, by the singular juxtaposition of small filaments.

2287. *Lynghya*. H. C. Lynghye, a Danish botanist, is the author of an excellent work on Algae, which he calls *Hydrophytologia Danica*. Tentamen, published at Copenhagen, in 1819, in one volume quarto. This genus differs from *Oscillatoria* in the absence of a mucous matrix, and from *Calothrix* in being curved and quite distinct. In habit it approaches *Conferva*.

2288. *Bangia*. So called in honor of Christian Frederick Bang, the author of a dissertation upon the plants of sacred history, published in 1767.

History, Use, Propagation, Culture,

2289. *Zygne'ma*. From *ζυγος*, a yoke, and *νημα*, a filament; in reference to the singular manner in which the filaments are jointed together in pairs.

2290. *Mougeo'tia*. Named in honor of J. B. Mougeot, the coadjutor of Nestler, in the publication of their useful work, the *Stirpes Cryptogamæ Vogeso-Rhcnanæ* which, we believe, is still continued.

* *Two dotted.*

- 15129 Articulations twice as long as broad, Stellæ roundish, Fruit spherical
 β Articulations thrice as long with two approximated stellæ in the middle
 γ Articulations about as long as broad
 15130 Articul. 4 times as long as broad: in fruit convolute, Sporeous matter continuous obscure on each side
 15131 Articulations about as broad as long, Stellæ transversely linear-oblong parallel, Rays obsolete
 15132 Filam. adnate, Articul. half as long again as broad, Stellæ transversely obl. pectinated, Fruit spherical

** *Marked with spires.*

- 15133 Filam. equal curved and flexuose conjugate at angles and twice as long as broad, Spires simple
 15134 Filam. equal, Spires simple contracted in beginning, at length arcuate, Artic. 3 times as long as broad
 15135 Artic. 4 times as long as broad: in fruit elliptical, Spires cruciate lax, Crosses about 4, Fruit elliptical
 15136 Articulations about as broad as long, Spires cruciate thin contracted, Fruit elliptical
 15137 Filaments simple slippery very fine, Dissepiments obscure, Articulations shortish cylindrical

- 15138 Filaments knee-jointed, Articulations six times as long as broad
 15139 Filaments purple-blue, Sporidia of the crosses of the filaments green

15140 Spots 5-cornered

A. *Simple.*

1. *Floating, arachnoid, colored.*

- 15141 Filaments simple creeping entangled in a brownish purple layer, Joints half as long again as broad
 15142 Filaments simple very fine adnate straight brown, Articulations four times as long as broad
 15143 Filam. simple fine mucous, Articulations about as long as broad marked in the middle with a narrow band

2. *Floating, arachnoid, mucous, green.*

- 15144 Filaments arachnoid simple very long in a uniform puckered layer, Artic. thrice as long as broad: when young dotted in the middle
 15145 Filam. arach. simp. very muc. entang. in a puckered layer. Artic. about as long as broad or $\frac{1}{2}$ as long again
 15146 Filam. simple mucous slippery capillary, when dry traversed by a longitudinal band, Artic. as long as broad
 15147 Filaments simple fine gelatinous tapered marked by a transverse band, Artic. about as long as broad
 15148 Filaments simple very fine gelatinous equal, Articulations twice as broad as long
 15149 Filaments simple fine curled entangled smooth, Artic. half as long again as broad

3. *Capillary or setaceous. Articulations filled with globose granules, when dry alternately compressed.*

- 15150 Filaments simple fine, Artic. 3 times as long as broad inflated elliptical
 15151 Filaments simple fine, Artic. half as long again as broad with globular inflations at intervals
 15152 Filam. simp. capill. very long straight equal, Artic. grain-bear. 2 or 4 times as long as broad shin. when dry
 β Artic. half as long again as broad
 15153 Filam. simple variously bent and loosely entangled, Artic. about as long as broad, Granules scattered
 15154 Filam. simple filiform rigid crisp loosely entangled, when dry variegated, Artic. turgid dotted
 15155 Filam. simple very short and minute entangled tortuous, Artic. twice as long as broad
 15156 Filam. simple stiffish curled entangled fine, Artic. 3 times as long as broad [moniform
 15157 Filam. simple filif. rigid crisp loosely entang. when dry variegated, Artic. about as long as broad, when dry
 15158 Filam. simple thicker than a bristle adnate straight rigid erect, Artic. elliptical when dry
 15159 Filam. simple thicker than a bristle adnate rigid erect, Artic. cylindrical 3 times as long as broad
 15160 Filam. simple very fine adnate stiffish curved, Artic. about as long as broad somewhat moniform
 15161 Filam. simple very fine adnate straight pendulous, Artic. about as long as broad moniform
 15162 Filam. simple fine adnate mucous, Artic. as long as broad and variable, Interstices pellucid
 15163 Filam. simple very fine, Artic. rather shorter than broad, Joints pellucid
 15164 Filam. simple very fine adnate mucous straight, Artic. as long as broad, Interstices pellucid
 15165 Filaments simple straight minute, Articulations oval half as long again as broad
 15166 Filaments simple very fine adnate rigid tapered, Lower artic. shorter than broad: upper as long as broad

4. *Adnate, pencilled, fastigiate, colored.*

- 15167 Filaments simple rigid fastigiate, Artic. twice as long as broad
 15168 Filaments simple fascicled rigid short attenuated at each end, Artic. somewhat longer than broad
 15169 Filam. simple fine short, Artic. torose about 3 times as long as broad, Sap contained in a central globule

B. *Branched.*

- 15170 Filam. branched flexuose short, Branches scattered spreading blunt, Artic. half as long again as broad
 15171 Filam. branched densely tufted rigid short, Branches 1-sided, Artic. generally thickest at the end about 3 times as long as broad

and *Miscellaneous Particulars.*

2291. *Hydrodictyon.* From *ὕδωρ*, water, and *δίκτυον*, a net; water-net; so named on account of its singular reticulated structure.

2292. *Conferva.* A syncope of the Latin *conferruminare*, to consolidate. Plants of this kind were formerly

History, Use, Propagation, Culture,

held to be efficacious in healing fractured limbs. Pliny declares, he was witness to a cure of this kind. Some of the species of this genus are believed to be merely the young of mosses.

2293. *Bulbochæte*. From *βουλος*, a club, and *χαίτη*, a bristle, in reference to the bristly end of the primary filaments.

2294. *Nitella*. From *nitelo*, to shine. A genus separated by Agardh from Chara, because the stem is composed of a simple tube, and not of one spirally striated. The plants have the habit of Chara.

2295. *Chara*. The origin of this word is unknown. It first occurs in Caesar's Commentaries, where it is mentioned as the name of a plant, the root of which was used by the Roman soldiers as food. That plant could have had no relation to the plant of the moderns. Various opinions have been held with regard to the station of this genus. Linnæus referred it to the perfect plants, and he has been followed by many botanists. Dr. Hooker and Mr. Lindley, in the former's Flora Scotica, formed it into a particular order, placed between Algæ and Hepaticæ; and with this opinion Dr. Greville coincides. But Professor Agardh thinks it cannot even be separated from true Algæ, in the midst of which he has placed it. The nature of the fructification is so paradoxical, that it is scarcely possible to trace an analogy between it and the fructification of any other plant.

- 15172 Filam. branched very minute equal parallelly exerted from an orbicular base
 15173 Filam. branched remotely capillary very long, Branches short divaricating, Artic. twice as long as broad
 15174 Filam. branched capillary, Branches alternate: those at the end clustered one-sided erect, Artic. cylind. about twice as long as broad
 15175 Filam. branch. Branches altern. rem. Artic. cylind. 6-10 times as long as broad alternately compr. when dry
 15176 Filam. branch. capill. Branch. divaricat. 1-sid.: upp. numer. somew. recurv. Artic. 4 times as long as broad
 15177 Filam. branched capillary, Branches spreading somewhat alternate, Artic. 3 times as long as broad
 ♂ Artic. elliptical proliferous, Puffulating filaments very fine

C. *Heaped.*

- 15178 Tufts fascic. clav. form. a hemisphere, Filam. intric. branch. Branch. ascend. Artic. about as long as broad
 15179 Filaments tufted, Branchlets long remote, Artic. oblong oval 3 times as long as broad
 15180 Filaments much branch. capillary, Branches spreading somew. alternate, Artic. 6 times as long as broad
 15181 Filaments much branch. capillary dichotom. at base, trichotom. in middle, Artic. 5 times as long as broad
 15182 Filam. much branch. capill. Branches divaricat. somew. recurv. very numer. Artic. twice as long as broad
 15183 Filam. dichotom. setac. rigid finally becoming blackish, Bran. erect rem. Artic. 3 times as long as broad
 15184 Filaments opposite much branched: first branches blackish; second greenish [as broad
 15185 Filam. much bran. setac. when dry dot. with black, Bran. erect, Joints pelluc. Artic. cylind. 3 times as long
 15186 Filam. from a common centre forming a globe rigid branched obtuse, Artic. 5 times as long as broad
 15187 Filam. branch. straight virg. capil. Branch. erect somew. hyal. and thicken. at end, Artic. of various lengths
 15188 Filam. branched straight virgate capillary mucous, Branches erect when dry black at the ends
 15189 Filam. more than bristly trichotom. shin. when dry dott. with black at joints, Artic. 3 times as long as broad
 15190 Filam. much branch. flexuose somew. cartilaginous fragile, Branches and branchl. scatter. Artic. torulose
 15191 Filam. much branched straight rigid, Branches generally in threes obtuse, Articul. very long
 15192 Filam. setac. dichotom. flexuose, Branch. rem. Branchl. short blunt, Artic. cylind. 4 times as long as broad

15193 The only species

- 15194 Stem long, Branchlets blunt, Nucules nearly naked in heaps at the joints of the stem
 15195 Stem trichotomous pellucid, Branchlets forked, Nucules axillary solitary
 15196 Stem 2-3-chotomous opaque, Branchlets forked or with broken joints, Globules solitary
 15197 Fruit branches filiform with other long jointed ones between, Nucules clustered axillary
 15198 Stem slender long, Branches acute forked, Fruit solitary

- 15199 Stem twisted furrowed strigose, Strigæ reflexed, Bractes aculeate
 15200 Stem twisted ash-colored, Branches not jointed, Bractes linear thin thrice as long as nucule

1. *Filaments short, fastigiate.*

- 15201 Filam. somew. branch. minute ferrug. Branch. scatter. blunt, Artic. pelluc. in mid. 3 times as long as broad
 15202 Filam. branched fine tufted, Branches scattered simple remote, Articul. 5 times as long as broad
 15203 Filam. creeping rooting densely entangl. much branch. Joints somew. contract. Artic. narrowest in middle
 15204 Filam. creeping minute branched, Branches erect naked at base pinnat. upw. Artic. twice as long as broad
 15205 Filam. much branch. fastig. short, Bran. erect acute, Artic. thrice as long as broad, Caps. lateral clustered
 15206 Filam. short capsitose pulvinate, Branches and branchlets fastigiate erect, Artic. twice as long as broad

2. *Filaments dichotomous, Branchlets forked, Joints obscure, Theæ involucred.*

- 15207 Filam. dichotom. much branched somewhat membranous variegated with purple and hyal. Joints elevated
 β Joints hairy

- 15208 Filam. dichotom. much branched somewhat cartilaginous, Branchlets forked, Artic. ovate opaque

3. *Branches furnished with branchlets, which are more or less dense and shortened.*

- 15209 Filam. branched virgate, Primary articulations twice as long as broad
 15210 Filam. setaceous dichotomous, Artic. thickened upwards about 5 times as long as broad
 15211 Filam. much branch.: prim. thick and contiguous, Altern. pinnules with artic. half as long again as broad
 15212 Filam. much branched: primary without joints, Artic. as long as broad

and Miscellaneous Particulars.

Greville observes, "This is a most curious tribe of plants, whose structure, I am convinced, is by no means well understood. At present, I have only minutely examined the fruit of *C. vulgaris*. Under a high power of the microscope, the globule is found to consist of seven triangular scales, which in maturity separate from each other, and produce the dichiscence of the globule. Each of these scales has a vacant portion in its centre, but the margin, which has a fluted appearance under a small magnifier, consists of a number of parallel, linear-oblong, hyaline, hollow tubes, placed at small intervals from each other, those forming the angles of the scale being branched. Within these tubes are a profusion of orange, globular, minute bodies (exactly similar to the spores of many cryptogamic plants, arranged in no order, and escaping on the least injury to the tubes. It is these little bodies which give the orange color to the globule. Within the globule is a mass of elastic white filaments, much convoluted, and distinctly either jointed or transversely rugose."

The calcareous matter of the stem and branches is not an adventitious incrustation, but is the result of some peculiar economy in the plant itself, as it evidently originates from within, and is covered with the cuticle. It is supposed to be analogous to the siliceous deposit beneath the cuticle of *Equisetum*.

♂ *Ceramium*. So called from *κεραμιον*, a little measure, in reference to the appearance of the capsules. All the species are found in the sea, and among the substances cast up upon the shore.

History, Use, Propagation, Culture,

2297. *Griffithsia*. Named after Mrs. Griffiths, of Devonshire, whose many discoveries in marine vegetation truly entitle her to this distinction: the highest which one botanist can bestow upon another.

2298. *Chaetospora*. From *χαίται*, a bristle, and *σπορα*, a spore: the latter are placed upon fine capillary divisions of the filaments.

2299. *Polysiphonia*. From *πολύς*, many, and *σίφων*, a siphon, in reference to the numerous little canals by which the colored matter is carried from one end of the plant to the other. Agardh calls these plants

4. *Branches pinnulate, Pinnule alternate.*

- 15213 Filam. branch. Branches virg. surround. by short corymbose fastig. branchl. Artic. 3 times as long as broad
 15214 Filam. branched, Branchlets alternate rigid spreading subulate, Artic. 3 times as long as broad
 15215 Filam. branched, Branchlets scattered decomp.-pinnate, Artic. 3 times as long as broad
 15216 Filam. branched, Branchlets scattered virgate, Artic. 8 times as long as broad
 15217 Filam. virgate with many simple or multifid pencilled ramuli, Artic. 3 times as long as broad
 15218 Primary filaments downy, Branches straight decomp pinnate, Artic. 3 times as long as broad
 15219 Filam. much branch. Artic. 4 times as long as broad by degrees becoming thickened, Caps. stalked ellipt.

5. *Filaments pinnated, Pinnae opposite.*

- 15220 Filam. pinnated, Pinnae opposite nearly simple, Artic. many times longer than broad
 15221 Filam. with irregular branches, having at each joint short slender opposite spreading recurved branchlets

1. *Branches fascicled.*

- 15222 Filam. branched, Branchlets subternate distant short multifid, Artic. much longer than broad [broad
 15223 Filam. branch. cover. all over with somew. whorl. imbricat. short multif. branchl. Artic. much longer than

2. *Dichotomous, chained.*

- 15224 Filam. dichotom. straight, Branches erect long, Articulations cylindrical about 5 times as long as broad
 15225 Filam. dichotom. Fibres multifid very fine, Articulations thickened upwards about 5 times as long as broad
 15226 Filaments dichotomous slippery, Articulations thickened 2-4 times as long as broad

15227 The only species

a. *Purple or scarlet, flat, somewhat pinnated.*

- 15228 Filaments bipinnate veiny rigid, Pinnae and pinnules alternate, Articulations rather shorter than long
 15229 Dark-red, Branches divaricate rigid, Articulations 3-tubed as long as broad, Stem rough with tubercles
 15230 Filam. very much branch. Primary not jointed, Branches decomp.-pinn. Pinnules heterogen. multif. fascic.

b. *Creping, Branches divaricating, often one-sided.*

- 15231 Filaments entangled with scattered branches, Branches divaricating, Articulations twice as long as broad

c. *Purple, whole-colored, adhering to paper.*

- 15232 Filaments nearly equal branched virgate, Branches erect, Lower articulations 5 times as long as broad

d. *Pencilled, black above, generally rose-colored above, adhering to paper.*

- 15233 Filam. much branched diffuse, Branches virgate spread. Lower artic. obsol. Artic. much longer than broad

- 15234 Filaments much branched at end diffuse, Lower articulations very short when dry nodulose: upper about as long as broad with 3 veins

β Filaments short somewhat pectinated, Branches nearly simple

- 15235 Filaments much branched diffuse, Branchlets spreading short, Articulations half as long again as broad
 15236 Filam. dichotom. pencilled much branched, Articulations shorter than long netted veiny: lower obsolete
 15237 Filam. much branched diffuse, Lower artic. 5-veined 4 times as long as broad: upp. 3-veined twice as long
 15238 First filament not jointed spirally veiny, Articulations as long as broad, Capsules axillary
 15239 Filaments branched veiny, Branches long, Artic. of stem long, of the branches thrice as short

e. *Black or blackish-brown when dry, rigid, scarcely adhering to paper.*

- 15340 Filam. dichotomous nearly equal fastigiate, Artic. shorter than broad with a black point in the middle
 15241 Filaments dichotomous irregularly branched at end, Branches and branchlets very straight: upper artic. 3 times as long as broad

- 15242 Filam. much branched long diff. Branchl. short spread squarr. recurved, Lower artic. long: upper short

f. *Branchlets lateral, short, fascicled.*

- 15243 Filaments decomp pinnated, Branchlets very short and fine, Articulations 3 times as long as broad
 15244 Filaments branched virgate, Branch. alternately pinnated, Branchlets short multifid, Theca sessile ovate
 15245 Filam. much branched covered with heterogeneous hair-like simple branchlets, Artic. very short obsolete

- 15246 Frond somewhat cartilaginous compressed transverse rugose bipinnated, Pinnules in fruit incurved

- 15247 Filam. nearly separate, Branches erect subulate, Artic. rather longer than broad, Pods linear subulate

- 15248 Filam. much branched very fine, Branches and branchlets opposite spreading attenuated acute, Artic. half as long again as broad

- 15249 Filam. much branch. Branches scatt. spread. taper. ac.: at tips hyal. Artic. as long as broad finally tumid

- 15250 Frond rope-like somew. spongy divid. into branches, Filam. densely entang. Artic. 4 times as long as broad

and Miscellaneous Particulars.

Hutchinson, not being aware that the name of Miss Hutellins had previously been applied to a genus of Cruclifera, by Mr. Brown. The species of this genus are, perhaps, the most beautiful of all the tribes of Confervæ.

230. *Rytiphlea*. So called, it is presumed, from *τυρίς*, a wrinkle, and *πλεω*, to be filled with any thing. The filaments are essentially characterized by their numerous transverse rugosities.

2301. *Ectocarpus*. From *εκτος*, outside, and *καρπος*, fruit, because the thecae are not included in the substance of the frond, as in the next genus, but placed on the outside. Marine plants.

History, Use, Propagation, Culture,

2202. *Sphacellaria*. This name has been suggested by the *sphacelated* appearance of the truncated extremities of the shoots, in which the reproductive organs are immersed.

2203. *Cladostephus*. From $\kappa\lambda\alpha\delta\omicron\varsigma$, a branch, and $\sigma\tau\epsilon\phi\omicron\varsigma$, a crown, in allusion to the manner in which the first stem is crowned as it were by the little compound whorled branches.

2204. *Vaucheria*. So named, in honor of M. Vaucher, of Geneva, an indefatigable collector of submersed Algæ.

2205. *Codium*. From $\kappa\omega\delta\iota\omicron\nu$, a skin, with reference to the appearance of the second species.

2206. *Bryopsis*. The filaments of this genus form little pinnated or imbricated branches, resembling bits of moss; whence the name has been formed, from $\beta\epsilon\upsilon\nu$, a moss, and $\psi\upsilon\iota\varsigma$, resemblance.

- 15251 Filam. twice or thrice dichotom. Artic. as long as broad, Tubercles ovate racemose on branched peduncles
 15252 Filam. much branched fine striated, Branches alternate somew. pinnated, Articulations as long as broad
 15253 Filaments branched rooting straight rigid, Branches scattered simple erect obtuse tapering at the base, Artic. about twice as broad as long
 15254 Primary filaments branched not jointed surrounded by pectinated spreading branchlets
 15255 Filaments bipinnate very fine, Pinnæ and pinnules opposite, Artic. very short, Theca ovate stalked
 15256 Stem covered with confervoid filam. Branches somew. bipinnate, Pinnæ pectinate, Altern. pinnules subd.
 15257 Setæ simple densely imbricated
 15258 Setæ incurved forked or crested imbricated

ULVACEÆ.

- 15259 Filaments setaceous dichotomous fastigiate, Thecæ globose sessile solitary
 β Filaments finer, Thecæ lanceolate and ovate
 15260 Filaments flexuose, Thecæ sessile lateral globose
 15261 Filaments descending rooting, Thecæ solitary terminal globose
 15262 Filaments dichotomous, Thecæ obovate stalked opposite on a common cornute pedic
 15263 Filaments branched cæspitose, Thecæ racemose
 15264 Filaments branched creeping, Branches erect nearly simple, Thecæ heaped towards the tips
 15265 Frond dichotomous fastigiate cylindrical
 15266 Frond globose hollow
 15267 Filam. branched naked below, pinnated in the middle, Branchlets opp. nearly simple approximating
 15268 Frond tubular inflated simple
 15269 Frond lanceolate ensiform much tapered at each end wavy crisp
 15270 Frond tubular lined clathrate branched filiform compressed, Branches simple tapering at base
 15271 Frond tubular irregularly clathrate filiform, Branches tapered
 15272 Fronds obovate or lanceolate flat wavy laciniated-crisp
 15273 Frond obovate slippery sinuous blistered finally expanded
 15274 Fronds blistered plaited-crisp rugose heaped in an expanded layer
 15275 Frond flat with numerous dilated segments
 15276 Frond flat ovate lanceolate flat wavy crisp at the edge

FLORIDEÆ.

- 15277 The only species
 15278 Jugament filiform compressed, Pinnules opposite pectinate-cut

and Miscellaneous Particulars.

2307. *Solenia*. So called, from *σωλην*, a tube, in allusion to the tubular nature of the frond.
 2308. *Ulva*. This was the common name applied by the Latins to all kinds of marine plants. The word is said to have been derived from the Celtic *ul*, water. The green laver which, stewed with lemon juice, is so much esteemed in England, is the *U. lactuca*.
 2309. *Porphyra*. This genus has received its name from *πορφύρα*, purple, on account of its being remarkable among Ulvaceæ for possessing that color.
 2310. *Polydes*. From *πολυδής*, multifarious, in allusion to the diversity of appearance of the single species.
 2311. *Ptilota*. Named in allusion to the form of the frond: from *πτελωτός*, pinnated.

2312. RHODOMELA. <i>Ag.</i> RHODOMELA.		<i>Sp.</i> 5—21.		
15279 <i>dentata</i> <i>Ag.</i>	toothed	flat branched	4 sum.	Ol.Br sea shore

History, Use, Propagation, Culture,

2312. *Rhodomela*. From *rhodos*, red, and *melos*, a limb; in allusion to the color of the fronds.
 2313. *Chondria*. The fronds of this genus are particularly cartilaginous, on which account its name has been formed from *χονδρος*, cartilage. *C. pinnatifida* is eaten in Scotland; it has a pungent flavor.
 2314. *Spherooccus*. From *σφαيرا*, an orb, and *κοκκος*, fruit. The thence of the genus are round, and contain a globose nucleus full of round sporidia.

- 15279 Frond flat obsolete ribb. alternately bipinnatifid, Pinnæ linear cuneate, Pinnules cut, Thecæ urceolate
 15280 Stem filiform covered with setaceous densely imbricated ramenta
 15281 Frond filiform much branched, Branchlets setaceous subulate pinnate fascicled
 15282 Frond filiform attenuate flexuose branched, Branches bipinnate: upper involute
 15283 Frond filiform equal, Ramenta simple about one-sided clustered involute
- 15284 Frond compres. filif. somew. contract. here and there, Fructif. either min. tuberc. or scatter. spor. in ramuli
 15285 Frond compressed 2-3-pinnate, Pinnæ alternate, Pinnules obtuse callous
 15286 Frond round filiform many-times pinnated, Pinnæ opposite cylindrical clavate short horizontal
 15287 Stem roundish filiform dichotomous, Ramenta elliptical scattered much attenuated at base
 15288 Stem round filiform much branched, Ramenta clavate much attenuated at base
 15289 Stem round filiform irregularly branched, Ramenta setaceous much tapered at base
 15290 Stem filiform much pinnated, Ramenta linear-lanceolate distichous tapering at base
 15291 Frond filiform contracted in joints tubular, Branches whorled
 15292 Frond filiform chain-like in joints tubular, Branches fastigiate dichotomous and whorled
- 15293 Stem scarcely any, Laminae chained obsolete ribbed cuneate 2-forked or lanceolate, Thecæ rugose sessile in the disk of the frond
 15294 Stem filiform somewhat dichotomous, Branches terminating in oblong 2-forked somewhat proliferous laminae, Thecæ spherical subulate terminal
 15295 Stem filiform dichotom. Branches expanded in cuneiform multifid laminae, Thecæ stalked ovate cauline
 15296 Stem filif. nearly simple expanded into a cuneif. palm. laminae: segm. ligulate, Thecæ hemisph. sess. on disk
 15297 Frond flat dichotomous, Segments linear-cuneiform, Thecæ hemispherical sess. on the disk of the frond
 15298 Frond somew. channel. dichotom. Segm. lin. cuneif. Thecæ spheric. scatter. on short stalks on disk of frond
 15299 Frond membran. leathery flat somew. lanc. somew. branched ciliat. Ciliæ subulate bearing thecæ at end

- 15300 Frond cartilagin. compressed lin. somew. dichotom. Segm. ciliated, Ciliæ bear. thecæ either at sides or ends
 15301 Frond cartilagin. corneous distich. branched, Segm. compressed flat linear bipinn. Pinnæ opp. spread. obt.

- 15302 Frond cartilagin. filif. compress. decomp. pinnated, Pinnæ horizontal altern. Pinnules bearing thecæ at end
 15303 Frond cartilaginous much branched dichotomous pinnated, Segments tapered at base: lower compressed 2-edged; the last furcate acute
 15304 Frond cartilaginous membranaceous dichotomous or palmate, Segments obtuse somewhat proliferous, Thecæ immersed in minute unequal processes
 15305 Frond membranous dichotomous, Thecæ spherical marginal sessile
 15306 Frond membranous dichotomous, Segm. linear: upper palmate crested entire, Thecæ margin. immersed
 15307 Frond cartilagin. round filif. Branch. long simp. surround. by little branch. Thecæ hemispher. sess. scatter.
 15308 Frond filif. corneous rigid equal with entang. branches, Branches horizontal 1-sided cluster. forked at end
 15309 Fronds filif. much branch. Branchl. setaceous tapered at each end setae. Thecæ spheric. attach. to branchl.

- 15310 Stem filiform dilated into a cartilaginous reniform or orbicular entire frond
 15311 Frond fleshy flat simple cuneiform tapered at base into the footstalk rounded at end
 15312 Frond coriaceous flat palmate entire, Segments cuneate oblong nearly simple

- 15313 Frond membranous tubular flat dichotomous, Axillæ rounded, Segments linear narrow by degrees sending out from the margin many simple ramenta
 15314 Frond gelatinous coriaceous dichotomous, Segments filiform: end membranous dilated elliptical lanceol.
 15315 Frond filiform with contracted articulations
 15316 Frond subgelatinous filiform, Branches remote long, Sporules naked in the substance of the branches

- 15317 Frond filiform compressed much branched, Branchlets setaceous distichous simple pectinate on each side

and Miscellaneous Particulars.

2315. *Halymenia*. From $\alpha\lambda\gamma\varsigma$, the sea, and $\iota\upsilon\omicron\sigma\pi$, a membrane. Marine plants with flat or tubular membranous fronds. *H. edulis* is the true Dulse, and *H. palmata* the common Dulse, both of which are eaten in Scotland.

2316. *Bonnemaisonia*. So called in honor of M. Bonnemaison, a French cryptogamic botanist, who particularly attended to Coniferæ.

History, Use, Propagation, Culture,

2317. *Delesseria*. The most beautiful of the *Fucus* tribe, so named in honor of M. Benjamin Delessert, a distinguished French patron of botany; and now holding the same station among the scientific men of Paris, as was lately occupied in London by Sir Joseph Banks.

2318. *Lemanea*. Named in honor of M. Leman, a French botanist, who possessed a considerable knowledge of Algae. This genus is the puzzle of writers upon Algae. It differs from all the *Nostochinae* in its substance, being in no way gelatinous, and in its compound structure, and separate fruit; for *Confervoidea* it is distinguished by its continuous frond, olivaceous color, and leathery texture. To *Fucoidea* it most nearly related in color, substance, and structure, but it is akin to no other genus, and its habits are entirely different from those of *Fucoidea*; the species being all found floating in fresh water.

2319. *Chordaria*. So called from the cord-like appearance of the species.

2320. *Scytosiphon*. The fronds of this genus are tubular and coriaceous; whence the name has been derived, from *σκυτος*, leathery, and *σισφος*, a siphon.

- 15318 Stem distinct, Leaves ovate stalked entire costate, Nerves transverse parallel
 15319 Stem winged, Leaves linear oblong subsessile proliferous from the costa, Veins diaphanous nearly parallel
 15320 Stem winged, Leaves linear-lanceolate costate veinless proliferous from the midrib netted
 15321 Frond ribbed obsolete nerved linear dichotomous alternately pinnatifid towards end, Pinnæ rather lingul.
 15322 Frond pinnated dichotomous much branched, Last branches falcate inwards and pectinate
 15323 Frond very fine linear irregularly split entire at end, Segments rounded at end not veined, Sori marginal
 15324 Frond very thin veinless roundish irregularly split at the end, Sori on the disk of the frond

FUCOIDEÆ.

- 15325 Filaments simple papillose, Papillæ usually ternate, Articulations 5 times as long as broad
 ♂ Branched torulose in a moniliform manner here and there
 15326 Filaments simple moniliform incurved l-colored
 15327 Frond much branched, Branchlets virgate somewhat distichous spreading at base
 15328 Frond quite simple
 15329 Frond setaceous branched in an irregular manner
 15330 Recept. elliptical lateral as long as peduncle
 15331 Branches spiny alternate
 15332 Frond many times pinnated, Pinnæ opposite capillary
 15333 Frond many times pinnated nodose, Pinnæ opposite, Nodi villous
 15334 Frond irregularly branched, torulose and rugose in every direction
 15335 Frond flat membranous scarcely nerved bipinnate, Pinnæ and pinnules opp. lin.-lanc. tapering at base
 15336 Frond linear dichotomous entire, Sori heaped about the costa
 15337 Frond inflated clavate
 15338 Fronds reniform flabelliform smooth membranous, Zones concentric
 15339 Dichotomous entire, Segments erect linear rounded blunt, Thecæ scattered on the disk
 15340 Frond dichotomous entire, Segments long slender acute
 15341 Stalk running through the lamina which is riddled with holes
 15342 Stalk winged with pinnæ and running through the ensiform lamina
 15343 Stalk round expanded into a roundish digitate split entire lamina
 15344 Root inflated-bulbous, Stalk flat expanded into a digitate split entire lamina
 15345 Stalk compressed expanded into an entire linear-oblong lamina
 15346 Stalk compressed expanded into a thin linear-lanceolate entire lamina

and Miscellaneous Particulars.

2221. *Sporocnusus*. The meaning of this word is not explained. The genus is remarkable for the nature of the reproductive organs, which consist of a minute receptacle formed by some clavate corpuscles, which are jointed and arranged in a concentric manner, and crowned with tufts of hair.

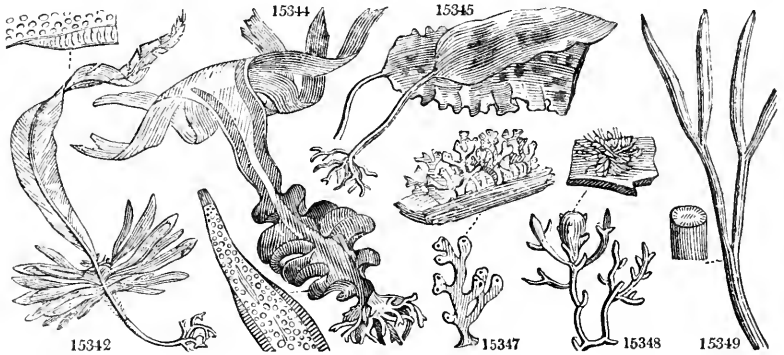

2222. *Huliseris*. This name literally signifies sea-cabbage; from *ἕλς*, the sea, and *σῆσις*, a sort of cabbage. The broad membranous fronds are not unlike the leaves of cabbage.

2223. *Eucalcium*. From *εὔ*, within, and *καλός*, hollow. The fronds are all tubular and bladderly.

2224. *Zonaria*. Beautiful marine plants marked with transverse zones of lines, in which the organs of reproduction are supposed to exist.

2225. *Laminaria*. The reproductive organs of this genus are situated in the form of large sori upon the lamina of the frond. *L. esculenta* is eaten in Scotland, where it is called *Badderlocks*. From *L. saccharina*, when dried in the sun, exudes a dry white sweetish substance, which is eaten as sugar by the poor inhabitants of Iceland. *L. buccinalis* furnishes the singular vegetable production called the sea-trumpet.

History, Use, Propagation, Culture,

2326. *Lichina*. So called in allusion to its supposed convertibility into some one of the Lichen tribe. Sir James Smith has made one species a Lichen and the other a *Fucus*.

2327. *Furcellaria*. Named on account of the dichotomous forked or *furcellate* arrangement of the fronds.
 2328. *Fucus*. So called by the Greeks. In Latin, the word signifies paint of any kind; a pigment staining red is afforded by certain species of *Fucus*. *Fucus vesiculosus* is much employed in the manufacture of kelp. It is common in great variety upon all the sea-coasts of these islands. It is known at first sight by its spherical vesicles filled with air. When the plant is dried, it becomes brittle, and of a dull black color, and sometimes it is covered with a saline efflorescence. Medically it is considered deobstruent, and has been found efficacious in scrofulous swellings. (*Thom. Lond. Disp.* 308.)

- 15347 Frond flat with spherical tubercles
 15348 Frond roundish with elliptical tubercles

15349 The only species

15350 Stem compressed here and there inflated with internal vesicles, Receptacles lateral distic. stalk. pyriform

15351 Frond flat ribbed lin. dichotom. entire, Vesicles spherical innate upon frond in pairs, Recept. term. elliptical

15352 Frond lin. costate ent. somew. dichotom. without vesicles, Lateral segm. narrowest multif. fruit-bearing

15353 Frond linear entire dichotomous without vesicles ribbed, Receptacles linear-elliptical

15354 Frond dichotomous ribbed serrated, Recept. solitary flat serrated

15355 Frond linear nerveless channelled dichotomous, Recept. terminal

15356 Frond filiform somewhat dichotomous, Recept. terminal cylindrical

15357 Cup radic. circular plano-convex emitt. from its centre a frond terminat. in a very long dichotom. recept.

15358 Lvs. densely spiny all over, Vesic. ellipt. somew. term. crown. solit. Recept. warty from inflat. base of spines

15359 Lvs. filiform dichotom. unarmed, Vesicles lanceolate chained, Recept. terminal ovate ellipt. mucronate

15360 Lower leaves thin costate pinnate, Pinnæ lanceolate crenulate, Vesicles lanceolate somewhat solitary

15361 Lvs. unarmed filif. much branched, Vesicles innate ovate-elliptical somew. chained, Recept. filif. terminal

15362 Stem compressed pinnated, Leaves distichous flat linear entire, some bearing vesicles, others receptacles

and Miscellaneous Particulars.

For rural economy, this and other species of *Fucus* are burned for their ashes, which produce the kelp or potash of commerce. On those shores of the sea where these plants do not abound, and where the water is sufficiently saline, the different species of fuci are raised artificially, by depositing stones at regular distances, on which the fuci spring up of themselves, and in four years yield a crop fit for cutting. Those who are interested on this subject will find ample information in the Transactions of the Highland Society of Scotland (vol. viii.), and in Headrick's Survey of Forfarshire. A condensed view of what is known on the subject will be found in the Encyclopædia of Agriculture *in loco*.

2329. *Cystoscira*. From *xvstis*, a bladder, and *σκιρα*, a chain. The upper parts of the frond have the appearance of little bladders chained together.

Order 8.

LICHENS.

Reproductive organs uniform. Sporules deposited in receptacles of various forms, distinct in substance from the thallus or frond, which is either pulverulent, crustaceous, membranous, foliaceous, or branched and shrub-like.

Thus, Algæ, and the collateral order Fungi, may be said to exhibit the lowest stage of vegetable development, and to contain the simplest forms of which plants are susceptible. Indeed it seems that each is resolved into the other when in the least stage of composition. Of this order, the lowest tribe, Pseudo-Lichenes, are considered Fungi by some authors, and have been formed into a distinct order by others, under the name of Hypoxyla. Here it seems best to consider them Lichens.

The fructification is usually in the form of shields or cup-like receptacles (a), dispersed over the surface of the frond or thallus (b), and bearing various names according to their nature. *Apothecia* is the common term used to designate the fructification. *Podetia* are the stalk-like processes of the frond (c), which bear the apothecia on their summit. *Scyphæ* are cup-like apothecia. *Cyphellæ* are pale tubercular spots on the under side of the frond. *Lacune* are small hollows or pits on the upper surface of the frond. *Soredia* are little heaps of free, pulverulent bodies, mostly of a whitish color, placed on various parts of the frond (c). *Pulvinuli* are spongy, excrecence-like bodies arising from the frond, and often resembling minute trees. *Nucleus proligerus*, or kernel, is a distinct cartilaginous body coming out entire from the apothecia, and containing sporules. *Lamina prolifera* is a distinct body containing the sporules, separating from the apothecia, often very convex and variable in form, and mostly dissolving into a gelatinous mass. The arrangement of Acharius, which is the most celebrated, is here followed.

TRIBE I. IDIOTHALAMI.

Apothecia differing in color from the rest of the plant, and formed of a distinct substance.

§ 1. *Apothecia simple, entirely formed of a sub-uniform, pulverulent, or cartilaginous substance. HOMOGENIT.*

* *Apothecia destitute of a raised margin.*

2330. *Spiloma*. Plant crustaceous, spreading, plane, adnate, uniform. Apothecia composed of minute bodies, collected into a compact, homogeneous, subpulverulent, naked, and shapeless colored mass.

2331. *Solorina*. Plant foliaceous, coriaceous, lobed, separate beneath, and veiny or fibrous with down. Recept. adnate, roundish, not edged, covered by a colored membrane, and containing a solid, cellular, bladdery parenchyma.

** *Apothecia with a raised border.*

2332. *Lecidea*. Plant various, crustaceous, spreading, plane, adnate, and uniform or foliaceous. Apothecia scutelliform, sessile, surrounded by a cartilaginous membrane; the disk of the same nature as the raised border.

2333. *Calicium*. Plant crustaceous, plane, spreading, adnate, uniform. Apothecia cup-shaped, sessile, or stipitate, cartilaginous, containing a compact pulverulent mass, plane or convex, and forming a naked disk.

2334. *Gyrophora*. Plant foliaceous, coriaceous, or cartilaginous, peltate, mostly monophyllous, free beneath. Apothecia subscutelliform, sessile, or adnate, covered with a black cartilaginous membrane; the disk warty or plicated in circles, and bordered.

§ 2. *Apothecia subsimple, included, formed of a single covering, containing a capsular body or nucleus. HETEROGENIT.*

2335. *Endocarpon*. Plant crustaceous, adnate, of some determinate figure, or foliaceous and peltate. Apothecia globose, concealed in the substance of the plant, surrounded by a thin membrane, furnished with a slightly prominent orifice, and containing a nucleus.

TRIBE II. CENOTHALAMI.

Apothecia partly formed from the substance of the plant.

§ 1. *Apothecia included in wart-like processes, formed from the substance of the plant. PHYNATOIDEI.*

2336. *Thelotrema*. Plant crustaceous, cartilaginous, plane, spreading, adnate, uniform, with wart-like receptacles, furnished with a wide pore, and bordered. Apothecia included, and containing a nucleus within a double covering.

2337. *Pyrenula*. Plant crustaceous, plano-expanded, adnate, uniform. Recept. wart-like, formed of the thallus, enclosing or surrounding at the base a solitary thalamium, with a simple, thick, papillose perithecium, containing a globose cellular nut.

2338. *Variotaria*. Plant crustaceous, plane, spreading, adnate, uniform. Apothecia wart-like, formed from the crust (resembling soredia), submarginate, white, including a naked nucleus.

§ 2. *Apothecia scutelliform, subsessile, the disk of a peculiar color different from the border, which is formed from the crust. DISCOIDEI.*

2339. *Urceolaria*. Plant crustaceous, spreading, adnate, uniform. Apothecia shield-like, the disk concave, colored, immersed in the crust; border formed from the crust, and the same color.

2340. *Lecanora*. Plant crustaceous, spreading, adnate, plane, uniform. Apothecia shield-like, thick, adnate, and sessile, the disk plano-convex, colored; border thickish, somewhat free, formed from the crust, and the same color.

2341. *Parmelia*. Plant foliaceous, between coriaceous and membranaceous, spreading, appressed, orbicular, lobed, and stellate, variously divided, fibrous beneath. Apothecia shield-like, attached by a central point; the disk concave, colored, with a border formed from the crust.

2342. *Borrera*. Plant cartilaginous, branched, and lacinate, the segments free, channelled beneath, and ciliate at the margin. Apothecia shield-like, with a colored disk; the border formed from the frond.

2343. *Cetraria*. Plant cartilagino-membranaceous, ascending or spreading, lobed, smooth, and naked on both sides. Apothecia shield-like, obliquely adnate with the margin, the disk colored, plano-concave; border inflexed, derived from the frond.

2344. *Sticta*. Plant foliaceous, coriaceo-cartilaginous, spreading, lobed, free and pubescent beneath, with little cavities or hollow spots. Apothecia shield-like, fixed by a central point, the disk colored, plane; border formed from the crust.

2345. *Peltidea*. Plant foliaceous, coriaceous, spreading, subadnate, lobed, with woolly veins beneath. Apothecia orbicular, adnate, on produced portions of the frond, the disk colored; border very thin, formed from the frond.

2346. *Nephroma*. Plant foliaceous, coriaceous, membranous, expanded, lobed, beneath separate, and naked or villous. Recept. resupinate, formed of the ascending lengthened lobes of the thallus. Fertile lamina reniform, entirely attached to the thallus and its lower side, and surrounded by an elevated inflexed margin.

2347. *Roccella*. Plant coriaceous, cartilaginous, branched, laciniated, round or flat, erect or pendulous, woolly inside. Recept. shield-like, thick, growing into the thallus. Fertile lamina forming a disk, plano-concave, colored, and cartilaginous, in the inside hyaline, and of a similar nature, surrounded by a margin, which is elevated, sessile, and as deep as the disk, and which contains a compact black powdery mass, which is hidden within the substance of the thallus.

2348. *Ecernia*. Plant branched, lacinate, angular, or compressed, suberect or pendulous, with a central filament within. Apothecia shield-like, sessile, the disk concave, colored; border formed the frond.

§ 3. *Apothecia subglobose, terminating the branches or podetia, or scattered, sessile, and emarginate.*
CEPHALODEI.

* *Apothecia covered by the mass of the fructification.*

2349. *Cenomyce*. General receptacle subcartilaginous, foliaceous, lacinate, subimbricated, free (rarely adnate, uniform, or wanting). Apothecia on podetia, orbicular, immarginate at length, capituliform, bearing thick colored masses of fructification.

2350. *Keomyces*. Plant crustaceous, spreading, plane, adnate. Apothecia on short, soft, solid, simple podetia, capituliform, solid, immarginate, colored, convex, reflexed at the margin.

2351. *Isidium*. Plant crustaceous, plane, spreading, adnate, uniform. Apothecia on very short solid podetia, orbicular, convex, solid, terminal; the disk subimmersed, having a border formed from the substance of the podetia.

2352. *Stereocaulon*. Plant shrubby, cartilaginous, branched. Apothecia turbinate, sessile, solid, plane above, at length subglobose, with a border formed from the frond.

** *Apothecia clothed with the substance of the frond, and containing a pulverulent mass.*

2353. *Sphaerophoron*. Plant cartilaginous, fibrous within, solid, shrubby, branched. Apothecia sessile, terminal, subglobose, bursting irregularly, and containing a black, globular, pulverulent mass.

TRIBE III. HOMOTHALAMI.

Apothecia entirely formed of the substance of the frond, and of a similar color.

2354. *Alcetoria*. Plant cartilaginous, subfiliform, fibrous, and somewhat fistulose within, branched, prostrate, or pendulous. Apothecia shield-like, thick, sessile, bordered, wholly formed from the frond.

2355. *Ramalina*. Plant cartilaginous, fibrous, and nearly solid within, branched, somewhat shrubby, mostly sorediferous. Apothecia shield-like, thick, subpedicellate and subpeltate, plane, bordered, wholly formed from the substance of the frond.

2356. *Cornicularia*. Plant cartilaginous, fibrous, and nearly solid within, branched, shrubby. Apothecia orbicular, terminal, obliquely peltate, at length convex, somewhat inflated; the border dentate.

2357. *Usnea*. Plant much branched, filiform, mostly pendulous, furnished within with a bundle of elastic fibres. Apothecia orbicular, terminal, peltate, often ciliate at the border.

2358. *Collema*. Plant subgelatinous, homogeneous, crustiform, foliaceous, or somewhat branched, membranaceous or cartilaginous when dry. Apothecia shield-like, bordered, formed from the substance of the frond; the disk sometimes differing in color when dried.

TRIBE IV. ATHALAMI.

Lichens destitute of apothecia, and whose fructification is unknown.

2359. *Leparia*. Whole plant crustaceo-pulverulent, spreading, adnate, uniform. Apothecia unknown.

TRIBE V. PSEUDO-LICHENES.

Apothecia black, corneous, imbedded in a receptacle. Spores in slender tubular cells, lying in a pulp, not spontaneously emitted.

2360. *Opegrapha*. Plant crustaceous, flat, expanded, adnate, uniform. Receptacle oblong and elongated, sessile, covered with a cartilaginous dark membrane, enclosing a solid parenchyma. Disk linear, edged on each side.

2361. *Ferrucaria*. Plant crustaceous, plane, expanded, adnate, uniform. Recept. hemispherical, roundish at the base, growing into the thallus, with a double perithecium; exterior somewhat cartilaginous and thick, having above a little pimple or perforation; inner very fine, and membranous. Kernel cellular.

2362. *Porina*. Plant crustaceous, cartilaginous, plano-expanded, adnate, uniform. Recept. wart-like, formed out of the thallus, and not margined. Thalamium imbedded in the substance of the wart, with a simple very thin perithecium, and a colored orifice thicker at the surface of the wart. Kernel roundish, cellular.

2363. *Athonia*. Plant crustaceous, plano-expanded, adnate, uniform. Recept. innate, sessile, of an irregular roundish figure, without an edge, covered by a somewhat cartilaginous membrane, and containing a solid uniform kernel.

2364. *Graphis*. Plant crustaceous, plano-expanded, adnate, uniform. Recept. long, immersed in the thallus, with a simple cartilaginous perithecium, which forms an edge all round the linear kernel, which is naked at top and bottom, and cellular inside.

History, Use, Propagation, Culture,

2330. *Spiloma*. This word signifies in Greek, a spreading discoloration of the cuticle, and well expresses the general character of the genus.

IDIOTHALAMI.

- 15363 Crust somewhat cartilaginous whitish, Apothecia crowded tumid oblong varying in figure roughish reddish at length brownish black and somewhat pruinose
 15364 Crust somewhat cartilaginous powdery cracked variegated with cinereous and yellow, Apothecia immersed superficial roundish finally confluent
 15365 Crust very thin glauc. Apothecia burst. forth min. convex cluster, and conflu. somew. branch. dark-color.
 15366 Crust very thin greyish, Apothecia flat diluted irregular somewhat confluent black
 15367 Crust spread. widely very thin membran. greyish, Apothecia dot-like very min. black lead-color. when dry
 15368 Crust obsolete or white, Apothecia very minute black confluent without bristles
 15369 Crust filmy very thin green. grey, Apothecia mostly dispers. hemispher. sooty: internally yellowish green
 15370 Crust spreading widely very thin; for the most part membranous greyish white, yellowish green when rubbed, Apothecia minute flat confluent bluish grey
 15371 Crust thin somew. powd. white, Apoth. scatter. min. dot-like solid black with superfic. dark-brown powder
 15372 Crust tartar. rugg. greyish-white cracked, Apothecia convex round. very black: their centers often decid.
 15373 Crust tartar. rugged greyish or greenish-white, Apothecia convex rounded black or orange-colored within
 15374 Crust calcareous greenish-white, Apothecia scattered somew. confluent unequal elevated granulat. black

- 15375 Thallus green. (brown when dry) lobed: ben. veiny and of a fine saffron-col. Apothecia somew. tum. brown
 15376 Thallus lobed grey.-green whiter and fibrous ben. Apothecia at length: sunk into deep pits or hollows brown

† *Thallus crustaceus reniform.*

* *Apothecia constantly black, naked, (not pruinose).*

- 15377 Crust tessellated greyish-black smooth, Apothecia several together depressed brownish-black with a paler border, at length crowded elevated the border being obliterated
 15378 Crust continued tessellat. greyish-black, Apothecia immersed between the areolae plane at length convex somewhat angular black of the same color within
 15379 Crust spreading very thin cracked black with swelling whitish scattered areolae, Apothecia plane or slightly convex often in the interstices black, of the same color within
 15380 Crust very thin black cracked and tessellated areolae chestnut-brown plane margined shining scattered, Apothecia rather convex black margined white within
 15381 Crust subcartilaginous tessellat. smoothish brownish grey, Apothecia buried in the crust plane margined at length convex clustered and losing their margin black within greyish-black
 15382 Crust tartareous cracked whitish ash-color, Apothecia within the spaces of the crust depressed flat finally convex somewhat confluent dark with a thin edge
 15383 Crust thin roundish very finely cracked somewhat powdery white, Apothecia grown into the crust thick protuberant somewhat concentric dark-colored with a tumid elevated contracted margin
 15384 Crust tartareous somew. spreading tessellated nearly even greyish-brown, Apothecia sessile at length irregular convex subglobose confluent black emarginate within having a thin greyish stratum ben. disk
 15385 Crust thin submembranaceous greyish-white bordered with black at length spreading somew. granulated, Apothecia nearly plane sessile margined black blackish within
 15386 Crust rugose and warted greyish-white, Apothecia at length convex hemispherical somew. tuberculated black horny and black within having beneath a powdery bright red stratum
 15387 Crust scattered granular irregularly lobed cinereous whitish, Apothecia clustered convex sessile plano-convex hemispherical somewhat confluent dark powdery inside
 β Crust scattered granular somewhat coloring white casious or cinereous brown, Apothecia hemispherical somewhat globose often clustered shining
 15388 Crust tartareous broken into cracks with wart-like smooth cracked cinereous areolae, Apothecia deeply immersed convex aggregate scarcely edged dark-colored
 15389 Crust tartareous brownish ash-colored composed of granulated warts, Tubercles convex irregular black with an obsolete black border
 15390 Crust somewhat cartilaginous scaly granular glaucous cinereous, Granules flattish crenulated, Apothecia sessile plano-concave edged finally wavy
 15391 Crust rugose somewhat granular ferruginous ash-colored, Apothecia superficial flat edged finally flexuose and convex, Edge finally obliterated
 15392 Crust spreading thin black scattered with planeish subcontiguous bright-yellow areolae, Apothecia plane or slightly concave black of the same color within
 γ Areolae bright-yellow plane angular black between and with a black margin
 15393 Crust tartareous tessellated yellowish-red, Apothecia sessile plane at length convex irregular confluent black internally cernuous and black
 15394 Crust granulated and tessellated somewhat pulverulent ochraceous red, Apothecia minute elevated with the margin tumid: the disk depressed black nearly of the same color internally

and Miscellaneous Particulars.

2531. *Solorina*. From *σολας*, solid, and *ερος*, a skin, in allusion to the firm texture of the frond.

2532. *Lecidea*. An unexplained name contrived by Acharius for the *Lichens tuberculati* of Linnaeus whose slaccids have no border from the substance of the frond or crust.

1535 Crust membranaceous white with a greyish or whitish-grey powdery substance scattered over it in small clusters, Apothecia minute appressed plane black

1536 Crust leprous granul. powdery green.-yell. Apothecia sess. margin. finally convex dark : of same col. inside

1537 Crust granular somewhat gelatinous greenish-brown, Apothecia appressed margined finally hemispherical clustered dark : of the same color inside

1538 Crust globose warted powdery cinereous yellowish, Apothecia convex scabrous

**** Apothecia black, naked : when moistened becoming-red or brown**

1539 Crust thin whitish, Apothecia plano-convex immersed in the stone margined dark : disk pruinose ; when moistened crimson, white inside

1540 Crust cracked into arcolae brownish ash-color edged with dark lines, Apothecia sessile flat becoming convex edged irregular black

***** Apothecia black with a grey bloom.**

1541 Crust tartareous contiguous even at length somewhat tessellated and whitish, Apothecia sessile and elevated plane black with a grey bloom and a black smooth border

β Crust of a regular figure contiguous whitish caesious, Apothecia immersed : disk depressed hollowish

1542 Crust spreading very thin smooth glaucous : fructification subsessile plane black with a grey bloom ; the border raised and swelling

1543 Crust tartareous contiguous very white, Apothecia sessile thick black powdery margined becoming convex with an ash-colored layer under the disk

1544 Crust tartareous defined tessellated white arcolae swelling, Apothecia sessile hemispherical with a grey bloom black within with a thin persistent margin

1545 Crust somewhat tartareous granular areolated uneven very white, Apothecia minute somew. immersed caesious becoming subglobose not margined dark cinereous inside

1546 Crust thick greyish-white cracked rugose at length mealy very white within, Apothecia numerous scattered minute : at first prominent and pale-brown ; then concave and black

****** Apothecia black-brown, brownish, or deadened by some other color.**

1547 Crust somewhat effuse granular cinereous greenish, Apothecia appressed flat dark-brown : Inside dirty-white with a thin flexuose edge paler than the disk

1548 Crust lep. granul. pale yellow-brown, Apoth. somew. immers. becom. conv. not margin. brown and black

1549 Crust thin granulat. somew. farin. green or green.-brown : fructific. conv. rug. irregul. confu. black.-brown

1540 Crust spread. leproso-farin. soft uneven glauc. green, Apothecia scatter. sess. brown with marg. cut. paler

1541 Crust tartareous cracked and broken uneven smoothish pale sulphur-color, Apothecia adnate plane scarcely margined brown and scarcely paler in the margin, at length irregular and convex

1542 Crust cracked areolated uneven somewhat powdery sulphureous, Apothecia minute sessile convex not margined whole-colored becoming hemispherical

1543 Crust granulated greyish-white, Granules becoming pulverulent, Apothecia nearly plane red flesh-colored livid or brown with the elevated margin paler, at length flexuose

1544 Crust firmer granulat. and subpapill. Apothecia at length hemispheric. rug. brown.-black and black confu.

1545 Crust thin tartareous contiguous greyish-white, Apothecia immersed plane margined, at length convex : the margin persistent glabrous reddish-brown ; of the same color within

1546 Crust thin whit. cover. with somew. globul. pale gran. at length grey. Apoth. sess. becom. conv. yel.-brown

1547 Crust thin membranous hoary finally granular powdery, Apothecia sessile concave thick tumid brown flesh-colored with an edge of the same color

β Crust very thin naked whitish, Apothecia flattish scarcely margined waxy purple brown and black

1548 Crust spreading very thin membranaceous white or greyish somew. shining subgranulose, Apothecia plane yellow-brown, at length red-brown with the margin paler elevated, at length flexuose

1549 Crust thin somewhat cracked uneven greyish-white : fructification plane, at length angular and irregular yellowish or reddish-brown ; the border narrow persistent

1540 Crust spreading somewhat scaly uneven roughish darkish-brown, Apothecia minute plane reddish yellow with the margin paler, at length somewhat convex and brownish

******* Apothecia dark-red, or whitish flesh-color.**

1541 Crust tessellated rugose darkish-grey, Apothecia plane rusty orange : the margin sometimes cretulate, at length convex with the margin obsolete blackish-red

1542 Crust leprose uneven somewhat granulated greenish-white, Apothecia nearly sessile plane flesh-colored, at length waved roughish in the disk : margin scarcely any

1543 Crust thin grey.-white, Apothecia somew. glob. at length urceol. white : disk flesh-color. ; marg. tum. cut.

1544 Crust thin smoothish minutely granulated greyish-white, Apothecia slightly convex entire whitish rose-color paler at the margin

******* Apothecia pale, yellowish, waxen or orange-colored.**

1545 Crust thin white powdery, Apothecia plano-convex smooth edged pale-yellow

1546 Crust cartilaginous cracked rugoso-plicate granulated white or greenish, Apothecia nearly sessile plane at length slightly convex waved unequal clustered pale yellowish

1547 Crust subtartareous tessellated pale, Apothecia nearly plane with the margin lobed waved clustered, at length subglobose destitute of margin yellowish flesh-color

History, Use, Propagation, Culture,

2333. *Calicium*. From *αλιων*, a little cup, well expressing the appearance of the organs of reproduction. All the species form grey, white, or yellow patches, of various extent, on old wrought wood, or boards exposed to the weather.

2334. *Gyrophora*. So named, from *γυρος*, a circle, and *φερα*, in allusion to the concentric circles, more or less

- 15428 Crust thin leprose powdery soft pale green.-yellow, Apothecia slightly convex pale yellowish: marg. obsol.
 15429 Crust thin effuse somew. granul. black, Apothecia min. cluster. flat yellow. with an elevat. ent. paler marg.
 15430 Crust thin smooth, white, Apoth. crowd. at length convex hemispher. margin. orange-color. white within
 †† *Thallus crustaceous, of a regular figure or leaf.* LEPIDOMA.
 15431 Crust somewhat imbricated white hoary, Lobes crenate reflexed tumid, Apothecia appressed black glaucous; edge finally wavy
 15432 Crust somewhat imbricated brownish-black covered with a greyish powder, Lobes entire swelling, Apothecia black naked, at length hemispherical with the margin obsolete
 15433 Crust imbricat. green.-brown, Lobes round. cren. paler ben. Apothecia plane, at length somew. conv. black
 15434 Crust somewhat contiguous lobed areolate and imbricated cinereous brownish-livid, Lobes becoming flexuose cut-crenate, Apothecia appressed not edged flattish finally confluent
 15435 Crust imbricated pale olive-green, Lobes distinct reniform nearly erect beneath and the margin powdery, Apothecia plane margined glaucous black
 15436 Crust indeterminate very thin fibrous black with white convex crowded smooth warts, Apothecia solitary in each wart depressed coal-black with a border of the same color
 15437 Crust somewhat imbricated, Lobes rounded crenate livid-brownish white beneath surrounding the apothecia, which are hemispherical clustered reddish not margined
 15438 Crust subimbricated, Lobes distinct subpetalate roundish flesh-colored and red brown whitish beneath, Apothecia in their border convex and subglobose black: margin obsolete
 15439 Crust imbricated glaucous white, Lobes minute rounded convex, Apothecia convex rufous brown becoming blackish: margin thin entire
 15440 Thallus slightly imbricated fragmentary grey.-green on a dense black fibrous cushion: its segm. somewhat linear lobed crenate and granular at the margin, Apothecia scattered fawny paler at the marg. at length convex brown obliterating the margin
 15441 Crust orbicul. rugose plait. hoary lobed-plait. in circumfer. Apothecia central plano-convex dark-colored
 15442 Closely imbricated radiated membranous very smooth brownish-grey pale with black fibres below: its segments linear obtuse undulated, Apothecia black with a black border of their own substance
 15443 Crust areolate-warted smoothish wavy, Apothecia sessile dark opaque, Disk flat tumid at edge
 15444 Crust somewhat contiguous unequal whitish or none, Apothecia sessile subglobose dark smooth: disk dot-like becoming flattish with a thin shining margin
 15445 Crust somewhat tartareous contiguous wrinkled olive-green, Apothecia roundish dark shining: disk depressed opaque, and stalks short whole-colored
 15446 Crust effused greyish somewhat pulverulent: fructification subglobose, at length flattened greyish-black with a cylindrical thickish-black peduncle
 15447 Crust very thin grey. smooth, Apothecia subglob.: disk dark-brown: margin greyish, Stripes filif. black
 15448 Crust cartilaginous areolate rugose smooth yellow-green, Apothecia lentiform ferruginous powdery, Stems short cylindrical dark-pitch color thicker at base
 15449 Crust lemon-yellow granulated and conglomerated: fructification sub-turbinate; disk brown convex, the border yellow and pulverulent, Peduncle filiform blackish and shining at the base
 15450 Crust thin white ash-color. Apoth. becom. lentif.: disk black.-brown ciner. pruin. with a yell.-green marg.
 15451 Crust thin whitish powdery, Apothecia lentiform: disk flesh-colored becoming brown powdered, Stalks filiform naked pale becoming brownish or black
 15452 Crust effuse powdery greenish-yellow, Apothecia globose, and stalks filif. very long flexuose yellow.-green
 15453 Crust leprose powdery pale yellowish-green, Apothecia hemispherical globose and stalks tapering upwards straight powdered with fulvous
 15454 Crust thin granulated tartareous rusty white, Apothecia on short stalks thick black often compound with a pale rusty disk
 15455 Crust white granulat. Tuber. a little prominent round flatt. gray.-black powdery with a smooth black edge
 15456 Crust granulated smooth greyish-white, Tubercles scattered roundish black polished wrinkled irregular without a border mostly sessile
 15457 Crust membran. very thin white, Tuber. black convex with recurv. marg. on long slender wavy black stalks
 15458 Crust thin tartareous somewhat granulated of a verdigreen-grey, Apothecia on slender black stalks black hemispherical with a convex brownish-black disk
 15459 Crust filmy very thin whitish, Apothecia on thickish black stalks obovate or hemispherical black with black prominent loose powder
 15460 Thallus smooth blackish-green: ben. smooth black and naked, Apothecia at length conv. rough and plait.
 β Thallus of many lvs. or lobes variously fold. black.-green quite black ben. on each side naked and smooth.
 15461 Thallus membranaceous with elevated reticulations, at length of a smoky ash-color rough smoother paler and sub-fibrillose beneath, Apothecia turbinate, at length convex variously plaited
 β Thallus thick hard rigid with elevated dots rugose olive-brown becoming black naked smooth pale-yellow beneath, Apothecia globose
 15462 Thallus somewhat naked dark greenish-grey folded and lobed strongly ciliated beneath smooth pale with branching fibres, Apothecia elevated nearly plane with concentric and plaited lines

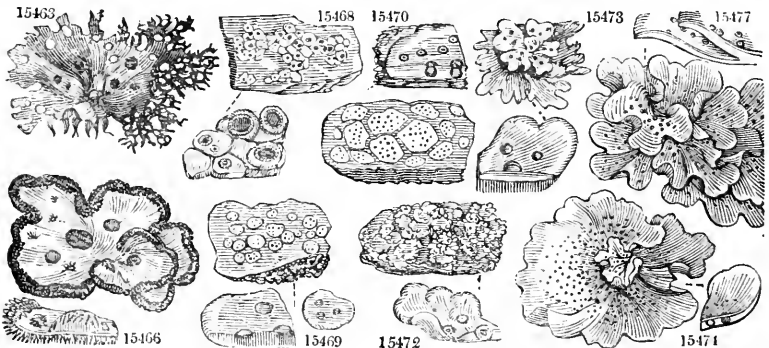

and Miscellaneous Particulars.

complicated, observable in the disk of the receptacles of the shields. The species grow chiefly upon exposed alpine rocks, chiefly on granite or volcanic stones. The vitrified forts in the Highlands of Scotland produce some of them.

15489 <i>globulífera Ach.</i>	globuliferous	uneven crust	$1\frac{1}{2}$	all sea.	Grsh	trees & rocks	Eng. bot. 2068

*History, Use, Propagation, Culture,*

2335. *Endocarpon.* From *ενδον*, within, and *καρτος*, fruit, because the receptacles of the sporules are deeply imbedded in the substance of the frond. The species form small roundish or angular plants, commonly closely sessile upon earth or stone; of a grey or olive hue; their fructification appearing like little black dots over the surface.

2336. *Thelotrema.* From *θηλον*, a nipple, and *τρημα*, an orifice. The protuberances of the thallus are perforated. This genus has been reduced to *Endocarpon* by Sir James Smith.

- 15463 *Thallus* rugged olivaceous brown, its circumference perforated and laciniated dark-grey : beneath glabrous somewhat granulated and fibrous, Apothecia somewhat convex variously plaited
- 15464 *Thallus* roughish olivaceous brown with a brown scattered dust smooth beneath with pits and reticulations naked of the same color, Apothecia plane with circular plaits, at length convex
- 15465 *Thallus* blistered and warty greenish ash-color ben. deeply pitted smooth palish-brown naked, Apothecia few plane margined : disk somewhat even papillose and plaited
- 15466 *Thallus* smooth sinuato-lobate of a greenish coppery-brown : beneath black with dense pulvinate fibres, Apothecia sessile, at length somewhat globose variously plaited intricate
- 15467 *Thallus* very rig. mouse-col. ben. black-brown rough with elevat. paler spots, Apoth. conv. various. plait.
- 15468 *Thallus* crustaceous cracked into areolæ figured somewhat lobed greenish rubiginous depressed at the circumference, Orifices depressed black
- 15469 *Thallus* crustaceo-cartilagineous somewhat foliaceous minute subpeltate appressed plane roundish entire yellow-green, Orifices of the apothecia depressed reddish-brown
- 15470 *Thallus* crustaceous submembranaceous spreading and subfoliaceous contiguous wavy cracked glaucous ash-col. irregul. lob. and crenat. at marg. ben. black somew. spongy, Orific. elevat. conv. black perforat.
- 15471 Plant subcartilagineous roundish or somewhat angular lobed of an olive-green : beneath pale at margin ; the rest blackish and fibrillose, Orifice of the fructification subprominent dark-brown
- 15472 *Thallus* coriaceo-membranous pallid leafy greenish crenate-lobed becoming irregularly ragged, Orifices hemispherical pale with a black dot
- 15473 *Thallus* coriaceo-convex rounded lobed copper-colored, at length rugged black and shaggy beneath, Orifices scattered sunken minute coal black, at length convex
- 15474 *Thallus* thick crustaceo-cartilagineous foliaceous orbicular peltate greyish spread at marg. somewhat lobed and waved beneath smooth, at length rugose and tawny, Orifices minute slightly prominent brownish
- 15475 *Thallus* cartilagineous foliaceous orbicular peltate brown or greyish : the border spread and wavy smooth naked rough and black beneath, Orifices of the apothecia very minute slightly prominent black
- 15476 *Thallus* coriaceo-cartilagineous lobed greyish : beneath brownish-black ; the lobes nearly erect rounded plicate and convolute, Orifices of the apothecia numerous convex black
- 15477 *Thallus* cartilagineo-coriaceous lobed greenish-brown olivaceous : beneath rather tawny or blackish on both sides smooth ; the lobes laciniated wavy plaited and crisped crowd. Orifices rather convex black

CÆNOTHALAMI.

- 15478 Crust smooth whitish, Warts of the apothecia smooth somewhat cone-shaped with the margin of the aperture thin simple somew. inflexed and contracted covered at bottom with a membrane which bursts
- 15479 Crust subtartarous thin contiguous greyish, Warts of the apothecia convex half immersed whiter, Orifices much contracted radiated with fissures concealing the flesh-colored apothecia
- 15480 Crust nearly regular smooth rugulose cinereous, Warts of apothecia clustered irregular whitish with a large black aperture and a thick somewhat angular lacerated edge
- 15481 Crust white powdery with granul. and min. soredia, Warts of apothecia appres. few and immers. in crust
- 15482 Crustaceous cream-colored with scattered rather convex warts opening by an irregular inflexed orifice, Apothecia immersed depressed brown
- 15483 Crust cartilagineous uneven somewhat polished greenish-grey, at length extremely tumid and uneven, Apothecia elevated crowded hollow very irregular
- 15484 Crust tartarous somewhat tessellated unequal brownish-black, Warts of the apothecia spreading at the base depressed somewhat rugose surrounding the greater part of the prominent apothecia
- 15485 Crust tartarous unequal cracked into areolæ cinereous yellowish, Warts of apothecia enlarged at their base depressed closed clustered about the edged orifice
- 15486 Crust tartarous regular finely cracked cinereous rufous, Warts of apothecia smooth reddish depressed above forming a margin to the papilla-like prominent orifice
- 15487 Crust determined somewhat cartilagineous smooth very white plaited in rays, Warts of apothecia polished compressed tumid : kernel covered with a thin powdery skin
- 15488 Crust subcartilagineous cracked into areolæ granular cinereous, Warts of apothecia convex clustered granular : kernel lentiform enclosed
- 15489 Crust subcartilagineous greyish uneven with granules and soredia scattered in an irregular manner, Warts of fructificat. subglob. smooth, at length depressed above and soredifer. and contain. a concave nucleus

and Miscellaneous Particulars.

2337. *Pyrenula*. A diminutive of *pyren*, a kernel; in allusion to the manner in which the receptacle is enclosed in the thalamium, as a kernel within its shell. Crustaceous plants, found chiefly upon the bark of trees.

2338. *Variolaria*. The shields of these plants resemble the eruptive spots of the variolæ or measles. The whole genus was referred by Linnaeus to his *Lichen fagineus* and *lacteus*. The species are of a crustaceous nature, found upon the trunks of trees, rocks, walls, or the ground.

History, Use, Propagation, Culture.

2339. *Urceolaria*. From *urceolus*, a little pitcher, with reference to the form of the shields, which are sunken in the crust. Natives of hard stones occasionally inundated, or upon naked exposed rocks, occasionally upon the trunks of trees. The crust of *U. esculenta*, a native of Tartary, is eatable.

2340. *Lecanora*. An unexplained name. *Lecanora perellus* affords a purple dye, and is called in the south of France, where it is employed in lieu of the *L. tartarea*, *Perelle d'Auvergne*, whence the specific name, as Smith

- 15490 Crust cartilaginous polished whitish becoming unequal and ash-colored scattered with white soredia having no margin, Warts of apothecia spheroidal powdery
 β Crust tartareous cartilaginous determined glaucous with a polished radiated cracked circumference, Soredia scattered superficial flat not margined
- 15491 Crust rugose cracked uneven subpulverulent white or greyish, Warts of the apothecia appressed plano-concave margined bearing soredia of the same color as the crust
 β Crust pulverulent white, at length greyish naked, Soredia crowded, at length spreading waved plano-concave with the margin raised swollen
- 15492 Crust tartareous distinctly bordered cracked smooth white: the circumference somewhat zoned crenulate-lobate, Warts of the apothecia crowded margined very white and pulverulent
- 15493 Crust elliptical thin slightly tartareous rugged grey scarcely limited, Apothecia rounded with a narrow border, Powder greenish
- 15494 Crust tartareous thickish greyish-white cracked tumid papillary and rugged obscurely zoned at the circumference, Apothecia orbicular prominent white
- 15495 Crust orbicular tartareous thin ash-colored cracked: its circumference indeterminate, Apothecia orbicular very small white with an elevated margin and flesh-colored disk
- 15496 Crust with a rather decided edge smooth with narrow cracks pale brick-colored: disk redd.; marg. tum.
 β Crust bordered smooth tessellated reddish, at length white, Apothecia becoming elevated with the disk rather convex reddish-brown reaching the margin of the crust
- 15497 Crust papillose warted polished white ash-color: disk concave black immersed in the tip of the warts, Border contracted protuberant crenate entire
- 15498 Crust cracked areolate warted cinereous bordered with black: disk somewhat concave dark immersed among the warts becoming elevated, Border thickish projecting
- 15499 Crust rugoso-plicate granulated white or greyish: fructification urceolate; the disk black, the border swelling inflexed subrugose covering the disk
- 15500 Crust continued calcareous smooth brownish-white irregularly cracked when dry, Apothecia very minute blackish sunk in the crust
- 15501 Crust determined finely cracked somewhat powdery very white becoming cinereous: disk minute concave black powdered with white, Border prominent discoid thin
 β Crust thin cracked into areolae equal dull ash-colored, Fertile areolae raised in the middle whitish lead-color: disk somewhat concave dark casious powdery

† *Thallus adnate uniform. RIMONIA.*

* *Disk of apothecia constantly dark and black.*

- 15502 Crust with a somewhat decided edge granulated and cracked greyish-white, Disk of the apothecia plane at length swelling and black: the margin free raised, at length waved and crenulate
- 15503 Crust smooth uneven warted pale, Warts at length subimbricated somewhat lobed and deformed, Disk of the fructification concave brownish-black: the border sharp crenulate contracted
- 15504 Crust glab. papill. and branch. white, Apothecia sess. scattered: disk slightly concave black; marg. tumid
- 15505 Crust effuse thin cracked rugose unequal cinereous, Disk of apothecia somewhat immersed finally elevated flat dark with an elevated inflexed powdery border
- 15506 Crust thin somewhat leprous and dispersed whitish, Disk of apothecia plano-convex dark dotted rough. Border obscure powdery
 β Crust uneq. obscure. ciner. black. Apothecia min. aggreg. flat with a white ciner. border and brown. edge

** *Disk of apothecia black, naked, brownish when moistened.*

- 15507 Crust verrucose-granular from cinereous brownish-green, Apothecia heaped with a flat coarse dark disk brown when moistened, Border tumid inflexed entire

*** *Disk of apothecia black, brown, brownish, or clouded with other colors, naked.*

- 15508 Crust cartilaginous smooth, at length granulated unequal white or greyish, Disk of the apothecia plano-convex brown or almost black: margin tumid entire, at length waved and crenate
- 15509 Crust tessellated with tumid warts yellow green or grey, Apothecia appressed, at length irregular with the disk plane or swelling red brown, at length rising above the entire margin
- 15510 Crust tartareous very much cracked variegated with black and white (yellowish-white in dispersed tumid warts), Apothecia pale-brown, at length convex dark-brown: margin white
- 15511 Crust effuse thin powdery cinereous æruginous, Apothecia minute appressed: disk flat becoming convex pale-brown, Border thin obscure
- 15512 Crust thin leprose white, Apothecia crowded elevated: disk plane olive; the margin waved
- 15513 Crust unguiculate granular somewhat warted pale-green, Apothecia clustered: disk flat pale-brown and variegated, Border raised inflexed finally crenulate
- 15514 Crust effuse very thin polished whitish sometimes bearing soredia, Apothecia sessile; disk flattish pale livid-brown, Border pale becoming crenulate

and Miscellaneous Particulars.

tells us, though generally spelled *Parcellus*. *L. Turneri* is probably only a variety growing upon the bark of trees.

Lecanora candelaria derives its name from the circumstance of the Swedes employing it to stain the candles that are used in their religious ceremonies.

Lecanora tartarea is the famous *Cudbear* (so called after a Mr. Cuthbert, who first brought it into use)

History, Use, Propagation, Culture,

employed to produce a purple for dyeing woollen yarn: and no where, perhaps, used to so great an extent as in the manufactory of Mr Mackintosh, at Glasgow. The manufacturers import it largely from Norway, where

- 15515 Crust cracked and areolate somewhat granular whitish, Disk of apothecia rufous becoming brown, Border white or yellowish becoming flexuose
 **** Disk of apothecia black, caesious, glaucous, or variously colored, always pruinose.
- 15516 Crust greenish ash-color with roundish warts, Circumference fibrous, Apothecia mixed: disk concave becoming flat blackish-glaucous; border elevated thick
- 15517 Crust tartareous tessellated even greyish-white, Apothecia immersed in the crust: the disk plane, at length convex subglobose glaucous and powdery; margin entire afterwards obliterated
- 15518 Crust cartilaginous membranous whitish ash-color, Apothecia clustered minute: disk flat becoming convex variegated with brown and black; border entire naked persistent
 β Crust becoming unequal somewhat granular ash-colored or blackish, Apothecia much clustered: disk flat brown and black; border crenulate powdery
- 15519 Crust thin leprous continuous cream-colored somewhat polished, Apothecia sessile whitish-buff uneven with a thin white wavy border
 ***** Disk of apothecia somewhat flesh-colored, pale, testaceous, waxen, or orange-colored.
- 15520 Crust granulated or somewhat warted white, Apothecia thick crowded by pressure angular: the disk concave, and as well as the tumid entire margin of the same color as the crust
- 15521 Crust very thin membranaceous smooth glaucous white bearing awl-shaped bristles, Disk of the apothecia at length spreading plane pale-yellowish
- 15522 Crust leprous granular powdery whitish-grey, Apothecia scattered thick powdery: disk concave pale flesh-colored; border tumid entire and flexuose
- 15523 Crust thin polish. hoary, Apothecia somew. inn.: disk flat fleshy-yell.; border thin somew. inflex. crenat.
- 15524 Crust tartareous with clustered granules greyish white, Apothecia scattered: disk plano-convex a little wrinkled flesh-color; the margin inflexed, at length waved
 β Crust thin glaucous white running out into papillae and spinuliferous branches [becoming black
- 15525 Crust gran. ciner. Disk of apothecia flat convex yellowish wax-colored; border elevated inflexed hoary
- 15526 Crust leprous-tartareous granular powdery dirty-white, Apothecia scattered: disk waxen covered by the powdery inflexed border becoming convex and dilated
- 15527 Crust granulated bright-yellow, Apothecia crowded: the disk plane of the color as the crust, at length convex deeper colored and powdery; the margin elevated thin, at length waved pulverulent
- 15528 Crust granular unequal dirty-yellow, Disk of apothecia flat becoming convex somewhat orange-colored; border thin crenulated becoming entire and flexuose
- 15529 Crust cracked subrugose greenish-yellow, Apothecia at length subglobose deep orange shining when the entire margin becomes obliterated
 ***** Disk of apothecia red, scarlet, or purple, and sanguine.
- 15530 Crust submembranaceous smooth, at length unequal pulverul. and granular white, Apothecia crowded: the disk concave red; margin tumid inflexed crenulate
- 15531 Crust tartareous pulverulent whitish, Apothecia imbedded scattered subconfluent: the disk scarlet rather convex; the margin sometimes obliterated
 β Crust tartar. granul. powd. whit. Apothecia sess.: disk flat deep sanguine; bord. elevat. thick rug. persist.
- †† *Thallus adnate, radiate, stellate, and lobed in the circumference.* PLACONITUM.
- 15532 Crust plaited and wrinkled white: the circumference smooth lobed, Disk of the apothecia at length rather convex brownish-black: the margin thin entire
- 15533 Crust somewhat imbricated white, Lobes somewhat concave flexuose cut-crenate, Disk of apothecia flat yellowish-brown: border elevated tumid
- 15534 Crust subimbricated scaly somew. rugose uneven pallid-green radiated and lobed in the circumference: fructification extremely crowded; the disk plane yellowish-brown or subochraceous with a border, at length crenate waved
- 15535 Crust plaited and lobed cracked bright-yellow orange pulverulent: the circumference plicate and rayed; segm. lin. convex cut, Apothecia crowd.: disk at length convex of a deeper orange; marg. ent. waved
- 15536 Crust somew. imbricated plaited and rugose tawny orange naked, Lobes lin. lanc. waved convex somew. distant radiating, Disk of the apothecia concave of the same color with the crust marg. somew. inflex. ent.
- 15537 Crust somew. contiguous pale yellow with a plaited lobed edge, Lobes flexuose flat, Apothecia scattered, Disk very red plano-convex
- 15538 Crust cracked greyish plaited and rayed in the circumference lin. laciniate, Apothecia much crowded at at length angular: disk plane brownish black even with the margin of the crust
- 15539 Crust cracked pale reddish grey the circumference rayed and lobed having brown warts in the centre cracked and rayed: disk of the apothecia depressed reddish margin thick elevated entire
- 15540 Crust subimbricat. rugulose whitish lobed and cren. at the circumference: fructification crowd, angular; the disk plane brownish flesh-color pruinose with a raised and at length crenate flexuose border
 ††† *Thallus imbricated throughout.*
- 15541 Crust with lobed scales of a brownish ash-color: disk of the apothecia immersed nearly plane blackish brown with the margin at length prominent
- 15542 Crust scaly greenish, Lobes imbricated inciso-crenate waved irregular, Disk of the apothecia slightly swelling brownish orange margin thin entire at length obliterated

and Miscellaneous Particulars.

it grows more abundantly than with us; yet, in the Highland districts, many an industrious peasant gets a living by scraping this Lichen with an iron loop, and sending it to the Glasgow market. When I was in the

History, Use, Propagation, Culture,

neighbourhood of Fort Augustus, in 1807, a person could earn fourteen shillings per week at this work, selling the material at three shillings and fourpence the stone of twenty-two pounds. The fructified specimens are reckoned the best.

- 15543 Crust somewhat sealy greenish ash-colored becoming powdery, Lobes repand cut wavy with irregular margins, Disk of apothecia flat brownish black
 15544 Crust sealy yellow, Lobes very much crowded cut and lacinated imbricated their margins minutely granular, Apothecia nearly of the same color as the crust margin elevated entire
 β Crust formed of lobes with many crowded teeth and segments greyish yellow, Apothecia crowded waved : disk plane dilated of the same color as the crust at length fulvous and the margin crenulated
 15545 Crust sealy greenish-brown, Lobes minute somew. rounded with margin granular and crenulate. Apothecia submembran. : the disk concave at length dilated plane reddish brown the marg. elevated inflex. crenate
 15546 Crust imbricated greyish lobed and granulated ash-colored brown, Apothecia imbedded in the crust crowded irregular : disk rather convex red-brown the margin elevated crenulated persistent
 15547 Crust imbricated greyish, Lobes minute appressed blunt, Disk of the apothecia plane black margin elevated and crenate

† All the divisions of the thallus equal at end.

- 15548 Thallus cartilaginous rigid obicular livid and glaucous smooth bearing dark green scattered tufted excrescences : tawny beneath and downy, the lobes waved and lacinated angular, Apothecia reddish brown rugose at the margin
 15549 Thallus orbicular pale yellowish green rugose at length granulated black and hispid beneath the lobes waved lacinated round, nearly entire, Apoth. scatter. brown their margin incurv. entire at length pulverulent
 15550 Thallus roundish subcoriaceous white smooth finely dotted with black : hispid beneath, Lobes longish sinuate-crenate cut, Apothecia rufous brown
 15551 Thallus orbicular greyish white smooth blackish brown and hairy beneath, Lobes rounded cut plane their margin waved entire, Apothecia brown their margin thin entire
 15552 Thallus orbicular glaucous green naked with black fibres on the under side, Lobes rounded cut flat somewhat plaited at the edge, Apothecia rufous
 15553 Thallus orbicular membranaceous bright green above, beneath pale brown almost white and downy, Lobes waved and cut, the segments rounded subrenate, Apothecia red, the margin inflex. rugose and crenate
 15554 Thallus orbicular membranaceous finely rugose glaucous green, beneath blackish brown fibrous, Lobes cut rounded lax plaited entire
 15555 Thallus orbicular olive brown rugged with elevated points paler beneath and fibrous, Lobes radiating appressed plane dilated rounded and crenate, Apothecia dark-brown : the margin crenulated
 15556 Thallus orbicular bright yellow : beneath paler and fibrillose ; the lobes radiating appressed plane dilated round, crenate and crisped at the extremity, Apoth. of the same colour as the crust their margin entire
 15557 Thallus orbicular somewhat membranous contiguous plaited umber-olive colored cut crenate in the circumference with flat somewhat truncate lobules
 15558 Thallus orbicular cinereous powdery : beneath white with black fibres, Central segments plaited eroded crisp powdery at edge, Apothecia concave blackish brown
 15559 Thallus orbicular white hoary granular powdery : beneath of the same color with obsolete blackish fibres, Segments of the circumference flat cut crenate, Apothecia appressed flat brownish black
 15560 Thallus orbicular membranous glaucous ash-colored : blackish brown beneath, Lobes sinuate-cut ; the end ones rounded crenated, Apothecia brownish with an entire edge
 15561 Thallus orbicul. cinereous, Soredia grey margined, beneath brownish spongy and fibrous, Lobes concrete plaited : those of the circumference rounded cut crenate, Apothecia red with a tumid edge
 15562 Thallus orbicular yellowish white pulverulent greyish black and downy beneath, Lobes imbricated plane rounded slightly crenated, Apothecia reddish ("of the same color as crust") their margin pulverulent
 15563 Thallus orbicul. blueish-grey, beneath having a very thick spongy down, Lobes of circumference rounded and crenate, Apothec. scattered at length convex rusty-brown, their margin of same color and entire
 15564 Thall. orbic. brownish-grey, ben. having a blueish-grey spongy down, Lobes of circumf. obtusely notched elevated pale, Apothecia plane crowded central reddish-brown with tumid incurv. crenul. whit. margins
 15565 Thallus orbicular dark purplish-brown shining dotted with black, beneath black and fibrillose : the segments sinuato-multifid linear plane truncated crenate in the circumference, Apothecia dark-brown, the margin slightly crenulate
 15566 Thallus orbicul. greyish rough and pitted beneath black and fibrillose : the segments imbricated sinuated plane subretuse, Apothecia bright chestnut-brown, their margin subrenulated
 15567 Thallus orbicular pitchy-brown smooth beneath black and scarcely fibrillose : the segm. sinuated multifid divergent plane or slightly grooved, margins elevat. lacerat. Apothec. dark-brown, margin granulated
 15568 Thallus stellated shining pitchy-black, beneath black and almost naked : the segments nearly linear multifid and somewhat palmate convex, the margins and extremity recurved, Apothec. of the same color at length black with the margin crenated
 15569 Thallus orbic. tawny-brown paler beneath with blackish fibres : the segment multipartite nearly lin. convex, those of the circumf. dilated nearly plane and crenate, Apothecia dark-brown, their margin crenated
 15570 Thallus stellat. pale-grey, beneath black uneq. naked : the segments often uniting convex and almost round. lin. multifid roughish dotted with black, Apothecia reddish-brown, their margin somewhat crenulated
 15571 Thallus stellat. pale-greenish bear. powdery warts, beneath black with spongy fibres : segments of circumference multifid very narrow convex and almost rounded, Apothecia reddish-brown, marg. nearly cut.

and Miscellaneous Particulars.

2341. *Parmelia*. Named from $\tau\alpha\rho\lambda\mu\eta$, a sort of small shield, and $\epsilon\lambda\iota\sigma\mu\alpha$, to enclose. On the thallus of these plants scattered powdery warts are commonly found. These Hedwig has determined to be anthers, apparently for no other reason than that they are powdery, and that he could fix the title to nothing better.

History, Use, Propagation, Culture,

2342. *Borrera*. Dedicated by Acharius, to Mr. William Borrer, F. L. S., one of our most eminent British cryptogamic botanists. This genus is very natural in habit, including the Linnean genus *Lichen* and its allies.

2343. *Cetrario*. An unexplained name. *C. islandica* is common in Iceland and in the north of Germany, and is also found in the mountains of Asturias. It grows to the height of two or three inches only, and has a rugged bushy aspect. In Iceland and Lapland it is used as an article of diet; being boiled in broth or milk, after being freed from its bitter by repeated maceration in water, or dried and made into bread. It has of late years been brought in considerable quantities to this country for medicinal purposes. The dried plant differs very little from its appearance in a recent state. Medicinally it is tonic and demulcent; it has also been found useful in debilities after acute diseases, and in emaciations, particularly those arising from the great discharge

- 15572 Thallus stellat. pale-yellowish grey smooth, black and fibrous beneath: segments broadly lin. sinuato-pinnatifid, their sinuses broad and circular. Apothecia nearly plane dark-brown, their margin thin entire
- 15573 Thallus orbicular continuous rugose pale-grey pulverulent, beneath of the same color with blackish fibres: segments in the circumference distinct plane rounded waved inciso-crenate, Apothecia plane reddish-brown, their margin at length crenulate and pulverulent
- 15574 Thallus stellated pale-yellow green smooth bearing powdery warts, beneath brownish-black and fibrillose: the segments linear appressed plane dichotomous somewhat truncated, Apothecia subcentral small nearly plane brown, their margin entire
- 15575 Thallus orbicul. greenish-yell. smooth with blackish dots, brown and fibrillose beneath: segments sinuato-lobate rounded crenate nearly plane. Apothecia central chesnut-brown with the margin nearly entire
- 15576 Thallus stellated glabrous greenish-white, beneath snowy-white with greyish fibres: the segments imbricated linear plane cut and branched crenate, their extremities ascending and powdery, Apothecia central brown with a tumid singularly rough and crenate border
- 15577 Thallus stell. smooth greyish-white, beneath black and fibrillose: segm. multif. lin. broader upwards cut divaricated acute in the circumference frequently bearing powdery warts, Apothecia concave chesnut color with the margin entire
- 15578 Thallus stellated deep glaucous green caesious and pruinose when dry, beneath black and downy and hispid: the segment linear multifid in the circumference plane appress. waved retuse at the extremities, Apothecia glaucous black, the margin entire and waved at length leafy
- 15579 Thallus stellat. at length rugged and granulat. greyish-green, beneath with grey fibres: the segm. sublin. rather convex cut multifid, Apothecia glauc. black, their margin entire, at length waved and crenate
- 15580 Stellate greyish-white and glaucous sorediferous, ash-colored beneath with black fibres: segments linear cut multif. convex but plane at extremities: fructification subconcave black with a subinflexed border
 α Thallus stellate cinereous: segments branched separate recurved at edge roundish, some broader than the rest and powdery at the edge
- 15581 Orbicular greenish-grey, fibrous and black beneath, Lacine imbricated nearly plane multif. erosa-crenate somewhat ciliate: the margin sometimes raised; fructification very dark, the border raised entire
- 15582 Crust blueish-white tartareous minutely undulated, Apothecia clustered somewhat sunk: disk flat black or brown; margin thick externally black
- 15583 Thallus substellated glaucous white: beneath brownish black; the segm. sinuato-multifid convex glabrous inflated and ascending at the extremity, Apothecia red brown, their margin entire
- 15584 Thallus substellate greyish-green: beneath rugose blackish and white; segments sinuato-multifid nearly plane smooth bearing powdery warts and perforated; the extrem. inflated, Apoth. redd. : marg. entire
- 15585 Thallus greyish-white naked on both sides and of the same col. substellat. : segm. pinnatif. ascend. dilat. arched and ciliated at the extremity, Apothecia scattered: disk plane caesious black; its marg. entire
- 15586 Thallus palish: segments erect linear multifid attenuated ciliated: beneath very white powdery and channelled, Apothecia with a flat black caesious disk
- 15587 Thallus greenish-grey farinaceous: the segments linear attenuated branched grooved naked rugose and blackish beneath, Apothecia somewhat marginal cup-shaped with their margin thin inflexed
- 15588 Thallus yellow naked and of the same color on both sides: segments linear flattish pinnatifid branched fibrous at end, Apothecia somewhat terminal with an orange-colored disk
- 15589 Thallus yellow naked: segments dichotomously branched slightly compressed atten. divaricated complicated, Apothecia scattered: their disk plane orange-red; their margin entire naked
- 15590 Thallus greenish: segments linear branched attenuated ciliated at end whitish and channelled beneath, Apothecia somewhat terminal: disk concave becoming flat with a fringed border
- 15591 Thallus pale rufous downy: segm. divaricated tortuous linear tapering channelled on the under surface, Apothecia scattered: disk flattish brownish-black with a thin entire border
- 15592 Thallus pale-yellow very yellow beneath: the segments plane ascending erose crenate and crisped, Apothecia elevated: their disk brown; the margin crenulated
 β Thallus with segm. depressed: the lobes rounded crenate; margins crisped pulverulent and very yellow
- 15593 Thallus olive-brown paler beneath; the segments plane ascending lobed waved subcrenate, Apothecia elevated of the same color: their margin rugose and crenulate
- 15594 Thallus glaucous somewhat shining sinuated and lobed brown beneath: the segments cut and jagged curled ascending, Apothecia elevated chesnut-brown: their margin wrinkled
 β Thallus white on each side or with occasional black spots beneath

and Miscellaneous Particulars.

of ulcers; and diarrheas, dysentery, and hooping cough. Its virtues, however, have been greatly overrated. (*Thom. Lond. Disp.* 565.)

Though plentiful with us, it is scarcely sufficiently so to form an article of commerce. A great proportion of what comes to our shops, where it is in great request as a medicine in coughs, consumptions, &c. is procured from Norway or from Iceland. Immense quantities are gathered in the latter country, not only for sale, but for home consumption, as an article of common food. The bitter and purgative quality being extracted by steeping in water, the lichen is dried, reduced to powder, and made into a cake, or boiled and eaten with milk; and eaten with thankfulness, too, by the poor natives, who confess "that a bountiful Providence sends them bread out of the very stones." An ample account of the nutritive qualities of this plant may be found in the *Memoir of Professor Proust*, inserted in the *Journal de Physique*, for August, 1806.

History, Use, Propagation, Culture,

2344. *Sticta*. From *στειρος*, dotted, on account of the numerous little pits on the under surface of the fronds. One of the most handsome genera of Lichens, growing almost wholly upon trees. *Sticta pulmonacea* is supposed to possess the same qualities as the famous Iceland moss, *Cetraria islandica*.

2345. *Peltidea*. So called in allusion to the form of the shields, from *πελτιον*, a target. *Peltidea aphthosa*, a large handsome species, has its name from the circumstance related by Linnaeus, that the Swedish peasants boil it in milk as a cure for the aphtha, or thrush, in children.

2346. *Nephroma*. From *νεφρος*, a kidney; the apothecia are of a reniform figure. *N. polaris* is remarkable for being common to both the arctic and antarctic circles.

2347. *Roccella*. This is a slight alteration of the Portuguese *Roccha*, signifying a rock, in allusion to the

- 15595 Thallus sulphur-colored orange at the base pitted and reticulated erect nearly plane lacinated : its segm. multifid crisped crenato-dentate and often warted at joints, Apothecia plane flesh-col. : marg. crenulat.
- 15596 Thallus olive-brown paler beneath : the segments erect sublinear multifid channelled smooth dentato-ciliate ; fert. branches spreading, Apothecia appressed plane of the same color : margins elevated entire
- 15597 Thallus dark glaucous brown pitted with broad rounded spreading entire lobes, having bright lemon-colored powdery spots upon the margin and on the elevated parts between the pits : downy and tawny beneath with min. lemon-colored little hollows, Apothecia scattered black-brown : their margin entire
- 15598 Thallus glaucous shining very broad woolly beneath, Soredia minute yellow : segments rounded sinuated cut ; margin wavy crisp inflexed yellow-powdery
- 15599 Thallus olivaceous pitted and reticulated downy beneath with smooth prominences : the segm. sinuato-lobate truncated, Apothecia submarginal plane reddish : their margin rugose
- 15600 Thallus suborbicular glaucous greyish-green very broad somewhat pitted and having mealy warts : beneath downy tawny with white naked spots ; the segments rounded and lobed irregular, Apothecia scattered nearly plane reddish-brown : their margin somewhat crenate
- 15601 Thallus orbicular glaucous brown roundly lobed smooth grey and powdery at the margin : beneath with white hollow spots, Apothecia brown
- 15602 Thallus orbicular dark lurid-grey rough with brown granules : beneath grey-brown with white concave spots ; the segments roundly lobed nearly entire, Apothecia scattered dark-brown : their marg. entire
- 15603 Thallus wide rusty brown naked and pitted : brown and downy beneath with small pale excavations ; segments lobed and obtusely cut unequal, Apothecia marginal dark-brown
- 15604 Thallus greenish ash-color white beneath having dark brown prominent branched veins, Lobes rounded cut somewhat entire. Apothecia marginal plane rounded swelling brown scarcely crenulate at the margin
- 15605 Thallus ash-colored whitish and veiny beneath : the lobes rounded sinuated and cut crenate and crisped ; fertile lobules very short, Apothecia orbicular ascending nearly plane brown somewhat entire
- 15606 Thallus glaucous and brownish green lobed cren. and shining pale ben. with numerous brown branching reticulated veins : fertile lobules abbreviated, Apothecia terminal plane horizontal transversely oblong reddish brown with a nearly entire margin
- 15607 Thallus green smooth roundly lobed sprinkled with brown warts whitish beneath with brown branching veins : fertile lobules very long contracted in the middle their sides reflexed, Apothecia terminal large ascending red brown with a lacerated margin
- 15608 Thallus coriaceous concave even dark reddish-brown pale downy with obsolete veins beneath, Lobes rounded with numerous fruit-bearing processes
- 15609 Thallus greyish green with broad rounded lobes white beneath with brownish branching veins : fertile lobules rather long with their sides reflexed, Apothecia terminal nearly erect revolute reddish-brown with a subcrenulate border
- 15610 Thallus thin membranous somewhat downy with rounded lobes beneath whitish and netted with veins of the same color, Fertile lobes short, Apothecia minute
- 15611 Leathery ash-colored and even above : whitish smooth with indistinct pale veins beneath, Apothecia ascending rounded dark reddish brown
- 15612 Thallus glaucous green naked glabrous with brown reticulated veins beneath : fertile lobules very numerous elongate and as well as the brown terminal, Apothecia cucullato-revolute
- 15613 Thallus greyish brown pale pubescent and granulated beneath : fertile lobules very short, Apothecia large numerous reddish
- 15614 Thallus livid brown beneath naked wrinkled blackish, Fertile lobes short, Face of the apothecia brownish
- 15615 Thallus rounded glaucous green somewhat branched nearly erect, Apothecia scattered elevated : disk flat castaneous pruinose as broad as the border
- 15616 Thallus flat emereous greenish with dichotomous divisions, Segments attenuated, Apothecia marginal
- 15617 Thallus greenish white segments dichotomous multifid ascending linear-attenuate plane pitted grooved and white beneath, Apothecia bright brown concave

† *Thallus subcrustaceus uniform. Podetia hollow. PYCNOTHELIA.*

- 15618 Subcrustaceous uniform granulated greyish, Podetia ventricose glabrous white simple or branched, the branches very short confluent and subfastigate, Fructification minute reddish-brown

and Miscellaneous Particulars.

places where this plant is commonly found. This plant is the Orchall or Argol of the dyers, so celebrated for yielding a fine purple color, for which Cudbear is but a poor substitute.

2348. *Evernia* *Eusebes* signifies tall, or well branched. The name has been entrusted to express the habit of the species, which all form bushy, erect, or pendulous tufts.

2349. *Cenomyce*. From *κενός*, empty, and *μυκη*, a minute fungus, alluding to the hollowness of the little fungus-like receptacles. *Cenomyce rangeferina* : this is the Lichen which, for the greater part of the year, and especially in winter, is the support of the vast herds of rein-deer, in which consists all the wealth of the Laplanders. No vegetable, Linnæus tells us, grows throughout Lapland in such abundance as this, especially in woods of scattered pines, where, for very many miles together, the surface of the sterile soil is covered with it as with

History, Use, Propagation, Culture,

snow. On the destruction of forests by fire, when no other plant will find nutriment, this Lichen springs up and flourishes, and, after a few years, acquires its greatest size. Here the rein-deer are pastured, and whatever may be the depth of snow during the long winters of that climate, they have the power of penetrating it, and

†† *Thallus foliaceus. Podetia fistular dilated upwards and fertile, or sterile and subulate. Apothecia closed with a membrane. SCYPHOPHORA.*

* *Apothecia fuscous or pallid.*

15619 *Thallus foliaceus very pale glaucous green the segments subpalmated ascending obtuse and incurved, Podetia elongated turbinate all cup-bearing smooth the cups regular crenate with the margin at length leafy and proliferous, Apothecia brown*

15620 *Thallus foliaceus large glaucous yellow green white beneath the segments multifid waved crenate crisped, Podetia turbinate elongate mostly simple, Apothecia marginal reddish-brown*

15621 *Thallus foliaceus glaucous green: segments erect multifid narrow repando-subdentate, Podetia cylindrical short glabrous dingy at length black all of them cup-bearing: cups small regular dilated entire nearly plane proliferous from the centre, Apothecia marginal sessile brownish-black*

15622 *Thallus foliaceus: segments crenulated ascending, Podetia all turbinate elongate cup-shaped glabrous at length granulat. warty rough grey. green: cups regular; the margin at length prolifer. Apoth. brown*

15623 *Thallus foliaceus: the segments small crenate, Podetia elongate cylindrical cup-bearing sometimes subulate slightly pulverent. white: cups regular their margins ent. and crenat. at length prolifer. Apoth. brown*

β *Podetia elongated powdery white, Scyphe radiant at edge*

γ *Podetia elongate subulate simple or branched pulverulent white sterile or with reddish apothecia*

15624 *Thallus foliaceus, Segments broadish crenulate cut, Podetia longish smooth somewhat warted glaucous or whitish green, Apothecia irregular torn into rays proliferous at edge*

β *Thallus foliaceus ash-colored brittle: segments imbricated minute crenate, Podetia cylindrical rough and foliaceus: cups turbinate closed at length dilated and radiated, Apothecia marginal sessile or stalked brownish-black*

15625 *Thallus foliaceus, Segments small crenate, Podetia long subulate sterile and fertile smooth livid-brown, Apothecia cup-shaped toothed at edge occasionally proliferous*

β *Thallus foliaceus very minute, Podetia elongate subulate sterile and cup-bearing smth. greenish brown: cups toothed at the margin at length proliferous, Apothecia brown*

** *Apothecia scarlet or deep red.*

15626 *Thallus foliaceus small: segm. inciso-lobate crenate, Podetia cylindr. simple and somew. branch. at the extremity greenish white granulated rarely cup-bear.; cups narr. at length radiat. Apoth. minute scarlet*

15627 *Thallus foliaceus small: segments expanded rounded crenate beneath as well as on the cylindrical yellow green cup-bearing, Podetia pulverulent: cups narrow small at length large with the often branched numerous digitate or rayed proliferations tipped with the bright scarlet apothecia*

15628 *Thallus foliaceus minute: segments broadish cut crenate naked beneath, Podetia long thick subventricose sulphur-colored slightly pulverulent cup-bearing: cups narrow crenato-dentate at length dilated and jagged, Apothecia sessile and pedunculate scarlet*

15629 *Thallus foliaceus minute: segm. rounded crenate nak. beneath, Podetia elongated turbinate naked nearly pale yellow or greyish green all cup-bearing, cups with their margins spreading fertile, Apothecia large at length stalked scarlet*

β *Podetia rather short cup-bearing: cups dilat. crisp and foliac. term. by the scarlet stalk. Apoth. at leng. prolif.*

15630 *Thallus foliaceus minute: the segm. inciso-crenate naked beneath, Podetia elongate cylindr. rigid glabr. foliaceo-squamose pale all cup-bear.: cups narr. their margins fertile and prolifer. Apoth. crowd. scarlet*

††† *Thallus foliaceus. Podetia fistular dilated upwards and fertile. Apothecia pervious. SCHISMARIA.*

15631 *Thallus foliac. minute lobed and crenated, Podetia elongated branch. subventr. granulat. rough with leafy scales cup-bearing: cups irregular pervious dentato-radiate proliferous, Apothecia stalked pale brown*

†††† *Thallus foliaceus. Podetia somewhat fistular, cylindrical, simple, split at end or digitate. Rays all fertile. HELOPODIA.*

15632 *Thallus foliaceus with minute granular lobes, Podetia smooth granular pallid divided at end: divisions very short, Apothecia clustered brownish black*

††††† *Thallus foliaceus, scarcely any. Podetia cartilaginous, rigid, fistular, all tapering subulate branched. Axilla generally bored through. CLADONIA.*

15633 *Podetia elongated smooth at length scaly greenish white inflated curved branched, Branches lax subsecund their extremities divergent spinulose, Apothecia pale brown*

15634 *Podetia elongated smooth livid brown dichotomous. Axils not perforated, Branches narr. subulate curved the extremities forked divergent: fertile ones with brown apothecia*

β *Podetia elong. slender sparingly branch. Branches nearly erect: fertile bran. with brown capitate apoth.*

15635 *Podetia elongate glabr. pale dichotomous: the axils perforated open; extremities of the branches patent short acute and rigid, Apothecia small terminal brown*

15636 *Podetia elongate cylindr. erect roughish hoary branched: axils often perforated, Branches scattered very much divided spreading the ultimate ones subradiate or drooping, Apothecia subglobose clustered brown*

β *Podetia cinereous dichotomously branched rigid forming a cushion-like tuft, Axillae not bored through, End of branches mucronate diverging brownish*

†††††† *Thallus none. Podetia soft, subsolid, subulate, somewhat branched. Axilla not bored through. CERANIA.*

15637 *Podetia subulate nearly simple smooth very white subfistulose flexuose prostrate*

and Miscellaneous Particulars.

obtaining their necessary food. Linnaeus has given a beautiful description of this Lichen, and of the animals whose support it is, in the *Flora Laponica*, p. 322.

C. pyxidata is sometimes employed by the poor in the cure of the whooping-cough.

History, Use, Propagation, Culture,

2350. *Bæomyces*. From *βασις*, small, and *μυκης*, a fungus, a name well applied to this genus, which much resembles some minute kinds of *Agaricus* or *Helvella*.

2351. *Isidium*. From *ισος*, equal, in allusion, we presume, to the small difference which exists in size between the podetia and the substance of the frond.

2352. *Stereocaulon*. From *στερος*, hard, and *καυλον*, a stem, a name well adapted to express the peculiarities of this genus. Its firm branching frond is fitted to occupying the interstices of crumbling granite, and the cells of volcanic scoria. It is the first of its tribe which clothes the lava of volcanoes in a state of decay.

2353. *Spherophoron*. From *σφαيرا*, a globe, and *φερω*, to bear, in reference to the globular fructification. The most elegant genus of Lichens, at once known by its branched bushy smooth habit, like that of a coralline.

- 15638 Crust unif. granulat. greenish white, Podetia very short cylindr. Apoth. subglob. wrinkl. pale flesh-color
 15639 Crust uniform rugose granulat. and pulverulent greenish white, Podetia very short somewhat compresscd, Apothecia flattish at the top sometimes conglomerate reddish brown
 15640 Leaves minute somewhat imbricated rounded nearly entire, Podetia simple tubular smooth
 15641 Thallus clustered ascending leafy pinnatif. cut and crisped: bright green above; white beneath, Tubercles from the disk of leaves convex reddish brown
 15642 Crust tartareous cracked smoothish nearly even of a brownish cream-color thinner towards the edges, Podetia scattered short hemispherical simple of the same color as the crust, Apothecia brownish
 15643 Crust tartareous greyish white, Podetia at length elongat. round. simple or branch. Apoth. brownish-grey
 15644 Crust tartareous thin unequal cracked and greyish, Podetia subglobose at length cylindrical simple and branched, Apothecia dark-brown
 15645 Crust cracked areolate warty a little powdery unequal pale sulphur-color, Podetia becoming cylindrical simple and branched, Apothecia yellowish brown
 15646 Crust powdery sulphureous-green, Podetia roundish of the same color, Apothecia pale yellow
 15647 Crust somewhat cracked powdery and hoary, Podetia subglobose papilliform very close together, Apothecia brown hoary
 15647 Thallus greyish branch. and rough with granulat. excrescences, Branches crowded and very much divided, Apothecia scattered and terminal at length convex conglomerate blackish brown
 15648 Thallus palish-brown, Branches lateral elongate lax divaricat. and forked acumi. Apoth. subglobose smth.
 15649 Thallus greyish branched, Branches dichotomous short crowded fastigiatae naked rounded rather obtuse, Apothecia globoso-torbinatae somewhat warted
 15650 Thallus whit branch. Branc. compress. ramulose subfibrill. naked, Apoth. subglob. depress. and smth. above

HOMOTHALAMI.

- 15651 Thallus rounded somewhat shining livid-brown very much branched, Branches filiform compressed at the axis, Apothecia of the same color, at length convex entire at the margin
 15652 Thallus and subsimple branches flexuose or tortuose complicated rather rigid greyish-black decumbent
 15652 Thallus roundish angular somewhat pitted dichotomous pale-yellowish: the extremities much branched lax and slender, Apothecia rather concave livid pruinose, at length flattened
 15653 Thallus plane linear lacinated greyish-white glabrous but rugose and pitted subtreticulated: the ultimate branches attenuated, Apothecia mostly marginal plane pale flesh-colored
 15654 Thallus compressed glabrous pitted branched glauc. white, Branches thickened and fastigiatae upwards, Apothecia numerous terminal peltate subsessile white
 15654 Thallus and branches elongated, Branchlets cylindrical attenuated pitted and channelled, Apothecia subterminal appendiculated beneath
 15655 Thallus compressed glabrous somewhat pitted branched yellowish-grey, Branches linear attenuated, Apothecia scattered on short stalks of the same color as the thallus
 15656 Thallus compressed glabrous somewhat pitted bearing powdery warts rigid branched greyish or greenish-white, Branches linear attenuated, Apothecia scattered on short stalks plane somew. margin. whitish
 15657 Thallus flat somewhat membranous smooth a little pitted white torn, occasionally powdery with dilated flat soredia, Apothecia nearly terminal very large
 15658 Thallus deep pitchy-brown rounded or subcompressed smoothish distichously dichotomous, Branches fastigiatae black above, Apothecia plano-convex blackish-brown somew. marginated entire and toothed
 15659 Thallus glabrous chesnut-brown round. angular pitted and subcompressed naked, Branches and branchl. divaricately flexuose aculeated, Apothecia reddish-brown: the circumference somewhat toothed
 15659 Thallus glabrous chesnut-colored plano-compressed somewhat pitted with the margins denticulate, Branches and branchlets short patent attenuated, Apothecia spinose-radiate reddish-brown
 15660 Thallus black rounded capill. suberect branched, Branches fine short. scatter. pat.: exterm. curved grey.
 15661 Thallus glabrous pale yellowish-white roundish suberect branched, Branches short attenuated blackish at the points, Apothecia brownish pale in the circumference

and Miscellaneous Particulars.

2354. *Alectoria*, seems to derive its name from *αλεξτρος*, unmarried, because nothing has been made out respecting the male flowers. *A. usneoides* is a species which grow on trees in warm countries, such as Asia, Africa, and America, hanging down in branches from six to eighteen inches long: it was used by the Arabian physicians as a cordial, and also for the purpose of procuring sleep. *A. jubata* occasionally supplies the remainder with food; for which purpose the Laplanders cut down the trees, that the Lichen may be devoured from the topmost branches.

2355. *Ramalina*. This name does not appear to have any obvious meaning. The species are little bushy tufts generally covered with soredia. They are found in all parts of the world upon trees and rocks; but chiefly upon the former.

2356. *Cornicularia*. So called in allusion to the multitude of little horn-like divisions into which the thallus is divided. Crustaceous branched tufts, with a solid axis.

History, Use, Propagation, Culture,

2357. *Usnea*. This word is said to have originated in the Arabic *âchneh* or *âchnên*, which is, according to Golius, the name by which the Arabian physicians designate Lichens in general. Crustaceous branched tufts, usually hanging down from the substances on which they grow.

- 15662 Thallus decumbent rounded smoothish dichotomous greyish-black, Branches and branchl. flexuose intricate forked at the extremity, Apothecia somew. margined plane: circumference naked and granulated
- 15663 Thallus decumbent rounded roughish black, Branches intricate capillaceous: the ultimate ones simple, Apothecia of the same color entire in the circumference
- 15664 Minutely shrubby densely tufted erect entangled cylindrical corymbose black with palish notched tips
- 15665 Thallus nearly erect roughish greenish-grey with very numerous fine horizontal fibres, Branches patent subsimple, Apothecia plane very broad whitish ciliated: the cilia radiating long
- 15666 Thallus pendulous smooth pale, Branches lax much divided subfibrillose: the ultimate ones capillaceous, Apothecia plane broad ciliated, Cilia slender very long
 β Thallus nearly erect somewhat shrubby pale greenish-white very much branched subpulverulent and roughish, Branches very much divided flexuose intricate attenuated subfibrillose
- 15667 Thallus pendulous smoothish rounded thickish pale greenish-grey, Branches divergent here and there fibrillose capillary at their extremity articulated below
 β Thallus glabrous greenish-grey glabrous, Branches elongate dichotomously divided articulated, Articulations swelling distinct: ultimate branches capillary fibrillose

† *Thallus crust-like, irregular, or uniform.* PLACYNTHIUM.

- 15668 Thallus crustaceous roundish brown-black: lobes of the circumference cut crenate; central granular a little branched, Apothecia becoming convex black-edged
- †† *Thallus imbricated, plaited, roundish, composed of minute lobes, becoming very turgid when wet.* ENCHYLIIUM.
- 15669 Thallus suborbicular imbricated: lobes thick; all minute rounded crenulated ascending, Apothecia nearly plane aggregated of the same color as the thallus: the margin crenulated subevanescent
- 15670 Thallus roundish: lobes rounded expanded naked thickened at edge crenate ascending, Apothecia scattered minute concave dull yellow-brown: exterior margin tumid and unequal
- 15671 Suborbicular: the central lobes somewhat erect granulated; those of circumference depressed larger obt. crenulate, Fructification scattered rather concave reddish with a granulated margin
- 15672 Suborbicular imbricated: lobes thickish flat incumbent roundish cut lobed and crenulate, Apothecia scattered immersed in the lobes and concave rufous with an entire edge
- 15673 Suborbicular imbricated: lobes all thick rounded lobed plaited in circles wavy suberect entire, Apothecia scattered concave whole-colored
- 15674 Thallus cushion-like formed of thick close blunt complicated lobes, Apothecia somew. marginal roundish whole-colored: disk uveolate with a double edge
- 15675 Thallus orbicular somewhat stellated imbricated: lobes cut and lacinated; margins elevat. waved crisp. and crenulated, Apothecia marginal nearly plane of same color as thallus: their margin granulated
 β Lobes of the thallus deeply lacinated narrow multifid spreading flexuose nearly plane crenate and lobed, Apothecia marginal and scattered dark-brown their margin entire
- 15676 Thallus suborbicular imbricato-plateate: plaits central erect flexuose, Lobes of the circumference rounded inciso-crenate, Apothecia marginal turbinate fasciculate: disk rather convex reddish
- 15677 Thallus lobed stary dark green, Apothecium central elevated brownish pink with a paler entire margin
- 15678 Thallus thick dark-green with elevated intestine-like convolutions

- ††† *Thallus somewhat foliaceus irregular, formed of naked, expanded, thick, turgid, naked lobes.* SEYNIUM.
- 15679 Thallus subfoliaceous green-brown-glaucous: lobes thick close palmate cut; segments somewhat linear round, Apothecia rufous brown
- 15680 Leafy gelatinous fleshy granulated on both sides of a blackish-olive color, its lobes crowded rounded plaited crisp and cut, Apothecia scattered dark brown
- 15681 Frond radiating fleshy; segments repeatedly forked fan-shaped crenate convex above concave beneath, Shields prominent at length blackish and flat

†††† *Thallus foliaceus: lobes rounded, downy or fibrous beneath.* MALLOTIUM.

- 15682 Thallus foliaceous blackish-green glaucous and downy beneath, Lobes rounded waved entire, Apothecia scattered elevated plane reddish: their margin entire
- 15683 Thallus foliaceous somew. imbricated glauc. greenish-brown pubescent and somew. spongy beneath, Lobes rounded sinuated crenulat. and crisped, Apoth. depressed planish brown: their margin foliaceous crisped
- ††††† *Thallus foliaceus: lobes somewhat membranous, lax, naked, dark-green.* LATHAGRIUM.
- 15684 Thallus foliaceous membranous submono-phyllous orbicular depressed plaited rounded and lobed black-green, Apothecia central crowded at length convex reddish brown their margin entire
- 15685 Thallus foliaceous membranaceous smooth blackish-green: lobes distinct rounded entire lax waved, Apothecia scattered nearly plane reddish: their margin thin entire
- 15686 Thallus foliaceous membranaceous somew. wrinkled complicate blackish-green granulated on both sides: lobes round, unequal waved and crisp. cut. Apoth. scattered plane dark-brown: their margin entire
- 15687 Thallus foliaceous membr. naked black: lobes small roundish cut nearly entire suberect plaited, Apoth. scattered sessile whole-colored with an entire edge
 β Lobes sinuate cut crisp toothletted

and Miscellaneous rarticulars.

258. *Collema*. A Greek word signifying a glutinous substance. All the species are gelatinous, and are supposed by Fries to be Algae in a Licheniform state. *Nostoc caruleum* has been positively stated to be convertible into *Collema linosum*.

History, Use, Propagation, Culture,

2359. *Lepraria*. Because the plants upon which these substances grow have the appearance of being diseased with leprosy.

2360. *Opegrapha*. From *οπη*, a chink, and *γραφω*, to write. The shields or apothecia are cracks upon the surface of the thallus resembling the brew or oriental characters upon a pale ground.

- +++++ *Thallus foliaceus* : lobes rounded, membranous, thin, naked, cinereous, glaucous, somewhat transparent. Apothecia slightly stalked. LEPTOGIUM.
- 15688 *Thallus foliaceus membranaceous* thin subdiaphanous lead-color obsolete rugose and dotted : lobes rounded somewhat cut, Apothecia scattered subpedicellate plane reddish-brown : their margin pale
- 15689 *Thallus* nearly erect foliac. membr. subdiaphan. subrugose with obscure reticulatous glauc. : lobes small subimbr. cut and laciniat. and somew. fringed, Apoth. scattered rather concave red : their margins pale
- +++++++ *Thallus very finely lacinated and branched*.
- 15690 *Thallus substellate* : the segments very narrow linear appressed very much branched obtuse, Apothecia central nearly plane of the same color as the crust : their margin thin entire
- 15691 *Thallus subimbricated* : segm. minute linear multifid unequal granular acute much clustered, Apothecia scattered fleshy rufous margined
- 15692 *Thallus subcaespitose* : segm. linear flat irregularly subdivided rugose obtuse ; margins repand obsolete crenated, Apothecia scattered of the same color
- 15693 *Thallus pulvinate brown*, Branches rounded nearly erect flexuose uneven subfastigate rather obtuse, Apothecia nearly terminal plane brown margined
- 15694 *Thallus dull-green* : segm. aggregate branched granular cylindrical obtuse, Apothecia scattered concave brown : externally spongy and pale with an erect thin margin

ATHALAMI.

- 15695 Crust thick pulvin. bright sulphur-color composed of a dust-like substance collect. into somew. hairy glob.
- 15696 Crust spreading equal thin somewhat cracked bright-yellow composed of subglobose granules
- 15697 Crust not discernible, Fruetification of an ochrey-yellow collected into thin scattered patches
- 15698 Crust. granulated continuous somewhat gelatin. : greyish dull-green when dry ; bright-green when wet

PSEUDO-LICHENES.

- † *Disk of apothecia very narrow, crack-like, somewhat covered in by the conniving tumid margins.* HYSTERINA.
- 15699 Crust somew. cracked unequal very white, Apothecia clustered minute oval-oblong turgid : disk closed
- 15700 Crust tartareous determined reddish-white, Clefts immerged convex without any elevated border repeatedly branched curved parallel and equidistant
- 15701 Crust tartareous smoothish cohering uneven whitish, Apothecia innate oblong : disk resembling a cleft, at length rugose waved plaited dissimilar rather confluent with the disk irregular somewhat debiscent
- β Crust tartareous or leprose uneven pulverulent, Apothecia roundish dissimilar waved plaited tortuose and variously expanded in the disk
- 15702 Crust tartareous powdery very white, Apothecia longish straight swelling opaque collected in a stellate manner : disk like a crack
- 15703 Crust very thin brownish-black, Apothecia minute much crowded roundish elliptical, at length rugose irregular : disk very narrow
- 15704 Crust somewhat membranous very finely cracked rugose roughish cinereous-brown, Apothecia minute innate clustered convex elliptical oblong straight with a crack-like disk
- β Crust membranous smoothish pale-olive or green and rufous-brown, Apothecia variable roundish oblong straight and curved
- 15705 Crust between cartilaginous and membranaceous somewhat sealy smoothish greyish-white, Apothecia sessile long or roundish waved somewhat shining with the disk very narrow
- 15706 Crust very thin of a regular figure polished cinereous, Apothecia innate minute convex rugulose opaque various : smaller dot-like ; longer very slender flexuose somewhat branched
- β Crust very thin shin. pale-olive, Apothecia subellipt. simp. somew. parallel becoming stellate and angular
- 15707 Crust membranous polished somewhat bordered whitish, Apothecia sessile various : the smaller globose or oblong ; larger very long narrow roundish flexuose
- β Crust regular membranous whitish, Apothecia sessile close together somewhat shining longish flexuose simple and branched : disk somewhat channelled
- †† *Disk of apothecia concave, channelled, or flat, appearing between the separated margins.* ALYXORIA.
- 15708 Crust cartilagin. lep. white, Apothecia scatter. sess. round. and oval deform. : disk flat becoming convex
- β Crust cartilaginous membranous dirty-white ash-color, Apothecia variable sessile oblong and tapering at each end opaque : disk flat
- ††† *Thallus cartilaginous, membranous, contiguous, polished.* LICCPHLEA.
- 15709 Crust very thin smooth much cracked very black, Apothecia very minute subglobose immersed : the extremity prominent umbilicated ; nucleus blackish

and Miscellaneous Particulars.

2361. *Ferrucaria*. Thus called, from *verruca*, a wart, on account of the verrucose nature of the shield. Schrader says, this genus differs from the similar *Eulocarpon* in having the shields always closed, while the latter explodes its contents by a small but distinct orifice.

History, Use, Propagation, Culture,

2362. *Porina*. From πορεύω, any thing that crumbles away, a name applied in consequence of the nature of the crust of these plants, which, indeed, is common to them with other Lichens.

2363 *Arthonia*. A name, the meaning of which is unexplained. The species are similar in habit to *Spiloma* and *Opegrapha*.

- 15710 Crust very thin determined polished brown. Apothecia min. hemisph. glob. without orifices : kernel white
 15711 Crust membranous determined shining somewhat olive-colored. Apothecia subsessile scattered hemispherical conoid papillose : kernel compressed somewhat membranous white
 15712 Crust exceedingly thin spreading quite white, Fructification minute roundish subelliptical, Tubercles semi-immersed : the interior white
 15713 Crust thin cartilaginous membranous polished becoming cracked whitish, Apothecia minute hemispherical clustered subconfluent with scarcely any orifice

†† *Thallus nearly solid, somewhat gelatinous.* BLENNORINA.

- 15714 Crust somewhat gelatinous roundish broken dark crenate cut radiated in the circumference, Apothecia subglobose immersed papillose at end

††† *Thallus subtartaraceous, crustaceous, contiguous, cracked into areolae, or powdery.* LITHOCTA.

- 15715 Crust tartar. contig. whitish, Apothecia minute clustered immersed subglobose dirty transparent inside
 15716 Crust tartaraceous contiguous bordered finely dotted mouse-color, Apothecia minute subglobose immersed with a prominent papilla : dirty-white inside
 15717 Crust tartaraceous contiguous finely cracked subrugose lead-color, Apothecia subglobose innate finely becoming depressed and scutelliform
 15718 Crust with the figure of a tree greenish-black bordered, Areolae nearly separate somewhat branched radiating, Apothecia conoid becoming concave above
 β Areolae of the crust dispersed deformed brownish-black

†††† *Thallus soft, cottony, somewhat spongy, or thin and arachnoid.* INODERMA.

- 15719 Thallus thin somew. fibrous uneq. pale-yell. Apothecia minute globose immersed with a prominent orifice

- 15720 Crust equal polished whitish ash-colored, Warts of apothecia subglobose, Orifices several depressed black

- 15721 Crust white powdery and cracked, Tubercles numerous depressed oblong irregular obtuse yellowish-brown clothed with deciduous mealliness

- 15722 Crust cartilagin. membr. white, Apoth. sess. broad. tum. round. rep. irreg. and confl. dark with elevat dots

- 15723 Crust membr. pale cinereous and glaucescent, Apoth. flatten. upon the crust plane angular substell. black

- 15724 Crust membr. somew. olive-col. Apoth. min. flat concav. somew. membr. oval-ellipt. and renif. wrink. dark
 15725 Crust thin subtartaraceous equal somewhat cracked white, Apoth. clustered flat somewhat immersed round oblong and curved black casious

- 15726 Crust membranac. smooth somew. shining white or greyish-brown bordered with black, Apothecia half immersed naked flexu. simple or branched : disk very narr. marg. formed of the thallus raised membranac.

- ♀ Crust elluse membr. whitish, Apoth. emerging flexuose with a channelled dehiscence casious disk with an elevated tumid margin

- γ Crust very thin hoary glaucous shining, Apothecia emerging straight long nearly simple acuminate somewhat parallel : disk channelled

- 15727 Crust somewhat cartilaginous unequal very white, Apothecia immersed flexuose branched black : branches divergent forked acute, Disk broad flat naked

- 15728 Crust cartilaginous membranous unequal rugulose of a regular figure white and cinereous, Apothecia immersed long clustered flexuose nearly simple and branched

- 15729 Crust membranous polished pale-olive, Apothecia clustered nearly simple curved turgid obtuse : disk broad convex cinereous pruinose with a thick powdery white margin

- 15730 Crust orbicular granular smooth white, Apothecia immersed scattered short straight nearly simple : margin of the perithecium with a longitudinal furrow

and Miscellaneous Particulars.

2364. *Graphis*. From *γεωργος*, to write. The apothecia are extremely similar in form to the characters of some strange language. It is very near *Opegrapha* from which it does not at all differ in habit.

Reproductive organs uniform. Sporules (e) arranged in tubular cells (f) placed in some parts of the external surface. Substance various (g), mostly thick and fleshy, sometimes vesicular. Frond none

In speaking of the eighth order, Lichens, it has been observed, that they, Algæ and Fungi, might be considered collateral. But perhaps Fungi should be estimated as still lower in the scale of creation than Lichens. From some passages in the writings of a celebrated Swedish author upon Fungi, Mr. Fries, whose mode of arrangement is almost entirely adopted here, it would seem as if he considered the three orders to consist of the same beings altered by the material on which they grow, and organized according to the different elements upon which they depend for support. Algæ, he observes, which are much extended in their native element, water, when exposed to the air, contract and become Lichens. Thus *Nostoc muscorum* becomes *Collema limosum*, &c.; and Sir James Smith has even decided, that *Lichina pygmæa* when growing under water is an Alga, and when above water a Lichen. But the differences between Fungi and Algæ, or Lichens, are greater, and arise out of their essence; that of Fungi being always reproductive, of Algæ primitive. In Algæ, the thallus is the most essential part, and the reproductive organs of secondary importance; in Fungi, the whole plant is generally a mass of reproductive matter, and the thallus always accidental. Fungi always grow upon dead vegetable matter; Lichens always upon living vegetation. The bark which, when living, bears Lichens, produces Fungi as soon as it begins to decay: and even on the same half-dead branch, the living side will be found occupied by Lichens, and the dead by minute Fungi. The lowest Fungi are considered by Fries, to bear the same relation to plants as Entozoa to animals; for which reason, he is of opinion, that all infusorial plants are Fungi, and not Algæ. But this may be doubted. The number of Fungi which may be conceived to exist is incalculable. Multitudes have been discovered by the researches of modern observers, and multitudes still remain to be detected, especially in extra-European countries. In Sweden, in the small space of a square furlong, where the number of Phænogamous plants was 420, and of Lichens and Algæ 430, Fries discovered more than 2000 species of Fungi.

The most celebrated writers on Fungi are Micheli, Schæffer, Bulliard, Bolton, Sowerby, and Greville, for figures; and Persoon, Link, Nees von Esenbeck, Fries, and Greville, as systematists.

Link defines the essence of a Fungus to be sporules disposed in a series, in elongated tubular cells; the cells situated in some part of the external surface. The part in which the reproductive organs are placed is called the *hymenium* (a), the hollow base from which the stem or *stipes* (a) arises is named the *volva* (b) or *wrapper*; the upper part is the cap or *pileus* (c), which is provided on the inferior surface with thin radiating expansions, which are termed gills or *lamellæ*, among which the sporules are situated. Many Agarics have a delicate fringe connecting the margin of the pileus at a certain age with the stem; this is called the veil (d), and is either general (*universale*), when adnate with the surface of the pileus, but becoming obsolete with age; or it is partial when it extends only from the margin of the pileus to the stipes. The *annulus* (d) is a kind of veil, which is sometimes fixed to the stem, at others free and capable of being moved upwards and downwards. The *Peridium*, *Perithecium*, or *Perisporium*, are different names for the envelope immediately enwrapping the sporules.

TRIBE I. HYMENOMYCETES.

Hymenium naked.

Class I. HYMENINI Æ AGARICINÆ.

Hymenium distinct. Receptacle long or expanded, superior.

Division I. *Pileati.*

Receptacle dilated, occasionally branched, having a tendency to an orbicular form. Hymenium inferior. Asci fixed.

2365. *Agaricus.* Hymenium in lamellæ. Lamellæ simple, parallel.

* *Stem central, with a veil. Gills unchangeable. Sporidia white.*

- 1. *Amanita.* Veil double, universal separate, partial annular somewhat persistent.
- 2. *Lepiota.* Veil simple, universal, concrete, annular, somewhat persistent.

Observations.

Tribe I. *Hymenomyces.* This tribe is readily distinguished from the others by its hymenium containing sporules within the surface, and not naked; from the *Pycnomycetes* by the want of a perithecium and a reproductive nucleus; from the *Gasteromyces* by the want of a peridium inclosing the sporules, which constitute the mass of the fungus, and from the *Thyphomyces* and *Coniomyces* by the sporidia not being exposed.

Division I. *Pileati.* This constitutes the most extensive division in Fungi, and includes almost every thing which was known to the ancients. Dioscorides mentions one or two species distinctly, comprehending the remainder among his eatable and unwholesome kinds. Pliny talks of the very numerous kinds of fungi, but describes very few. C. Bauhin knew about sixty, which he chiefly obtained from Clusius; Tournefort had two genera and eighty-seven species; Micheli six genera and about 800 species; Linnæus three genera and fifty species; Persoon, in his *Synopsis*, mentions nine genera and 683 species; finally, Fries describes more than a 1000 species arranged under many genera and subgenera.

The species are widely scattered over all Europe, but the extra European fungi, with the exception of those

- § 3. *Armillaria*. Veil simple, partial, separate, annular, somewhat persistent.
 § 4. *Limacium*. Veil very fugacious, viscid. Lamellæ adnate, decurrent.
 § 5. *Trichotoma*. Veil very fugacious, flocculose, marginal. Lamellæ emarginate or rounded.

*** Stem central, naked. Gills unchangeable. Sporidia white.

- § 6. *Russula*. Pileus fleshy, becoming depressed. Lamellæ equal, juiceless.
 § 7. *Golorheus*. Pileus fleshy, becoming depressed. Lamellæ unequal, milky.
 § 8. *Citocybe*. Pileus fleshy, when young convex. Lamellæ unequal, juiceless.
 § 9. *Collybia*. Pileus fleshy-membranous, flattish. Small, dry.
 § 10. *Myceea*. Pileus membranous, campanulate. Slender. Stipes hollow.
 § 11. *Omphalia*. Pileus membranous or fleshy-membranous, when young umbilicated.

*** Stem out of the centre, none. Gills unchangeable. Sporidia white.

- § 12. *Pleurotus*. Pileus out of the centre or lateral.

**** Stem always central. Veil O. Gills changing color. Sporidia rose-colored.

- § 13. *Moucceron*. Pileus fleshy, becoming depressed. Lamellæ long, decurrent. Color of new flower.
 § 14. *Clitopilus*. Pileus fleshy, convex.
 § 15. *Lepiota*. Pileus fleshy, membranous, from convex becoming plane. Small.
 § 16. *Nolanea*. Pileus membranous, campanulate. Slender. Stipes hollow.
 § 17. *Eccilia*. Pileus umbilicate. Lamellæ adnate.

***** Stem always central. Veil like cobweb. Gills changing color, becoming dry. Sporidia ochre-colored.

- § 18. *Tetamonia*. Veil annular, woven, somewhat persistent. Lamellæ distant.
 § 19. *Inoloma*. Veil fugacious. Lamellæ emarginate. Stipes bulbous. Color something of violet.
 § 20. *Dermocybe*. Veil fugacious. Lamellæ closely packed. Stipes equal.

***** Veil distinct, not like a cobweb. Gills discolored, somewhat persistent. Sporidia ferruginous.

- § 21. *Pholiota*. Veil dry, annular.
 § 22. *Myzocium*. Veil viscid, fugacious. Lamellæ affixed.
 § 23. *Hebeloma*. Veil marginal, fugacious. Lamellæ emarginate.

***** Veil very fugacious or spurious, not like a cobweb. Gills discolored, somewhat persistent. Sporidia ferruginous.

- § 24. *Flammula*. Pileus fleshy, convex, smooth, somewhat viscid. Lamellæ not emarginate.
 § 25. *Inocybe*. Veil formed of the longitudinal fibres of the fleshy convex pileus. Lamellæ whitish.
 § 26. *Naucoria*. Pileus fleshy, membranous, flattish, squamulose. Small. Lamellæ cinnamon-colored
 § 27. *Golera*. Pileus membranous, campanulate. Slender. Stipes hollow.
 § 28. *Tapina*. Pileus umbilicate, villous at edge.
 § 29. *Crepidotus*. Pileus out of the centre or sessile.

***** Veil present, not unlike a cobweb. Gills becoming discolored, cloudy, dissolving. Sporidia brownish-purple.

- § 30. *Folvaria*. Veil universal, separate. A volva.
 § 31. *Psalliota*. Veil annular.
 § 32. *Hypnotoma*. Veil marginal, fugacious. Lamellæ emarginate. Stipes bulbous.
 § 33. *Psilocybe*. Veil very fugacious. Pileus somewhat fleshy, and stipes equal, tenacious.
 § 34. *Psatyra*. Pileus somewhat membranous, and stipes brittle.
 § 35. *Coprinarius*. Lamellæ with a tendency to deliquesce. Veil partial. Sporidia black.
 2366. *Coprinus*. Hymenium in lamellæ, which finally become deliquescent. Asci separate with sporidia in four rows.
 2367. *Gomphus*. Hymenium in lamellæ, which are long branched and decurrent. Pileus turbinate, umbonate.
 2368. *Cantharellus*. Hymenium veined. Veins dichotomous, subparallel, sometimes anastomosing.
 2369. *Merulius*. Hymenium veined. Veins flexuose, or forming very irregular pores. Plants sessile, resupinate or effused.
 2370. *Schizophyllum*. Hymenium in lamellæ. Lamellæ bifid, lengthwise revolute.
 2371. *Dædalea*. Hymenium sinuous, composed of anastomosing lamellæ or flexuose elongated pores.
 2372. *Polyporus*. Hymenium porous, not separable from the substance of the pileus nor the pores from each other. Pores sometimes lacerating in age. Pileus very rarely with a central stipes.
 § 1. *Favolus*. Pores ample, with four or six angles resembling an honeycomb.
 § 2. *Microporus*. Pores minute, roundish.
 § 3. *Polysticta*. Dots superficial only.
 2373. *Boletus*. Hymenium tubular. Tubes separable from the pileus and from each other. Pileus always with a central stipes.
 2374. *Fistulina*. Hymenium tubular. Tubes loose, the young ones closed.
 2375. *Hydnum*. Hymenium subulate. Subulæ loose.
 2376. *Sistotrema*. Pileus carmose, irregularly stipitate. Hymenium composed of dentate, interrupted lamellæ.
 2377. *Phlebia*. Hymenium rugose, formed of long or confluent papillæ.
 2378. *Thelephora*. Plant with very few exceptions more or less adnate, thin, coriaceous, very rarely infundibuliform. Hymenium covering the outer surface.
 2. *Phylactria*. Sporidia four in a row. Resupinate and growing on the earth.
 3. *Himantia*. Effuse resupinate, when young byssoid. Sporidia few, innate in the hymenium, which is smooth and naked in the middle.
 4. *Leicostroma*. Resupinate, somewhat contiguous, smooth, or with spuricous papillæ. Asci none.

Observations.

on the coasts of Barbary, and a few from North America, are almost universally distinct from the European kinds. They are found growing on the earth, or in decayed wood, or similar substances; never upon rocks. Those which have been described as natives of vaults and places underground, are believed to be more monstrous formations. They are in greatest perfection in warm rainy weather, being chiefly the creations of summer and autumn; a few only appear in the spring, and scarcely any in the winter. The duration of the pleate fungi is often only ephemeral; some last from a week to a fortnight; and a few for a longer time. The *Dædaleæ* and *Polypori* are often called perennial, but it is the opinion of Fries, that their substance decays, and is only covered yearly by a fresh layer of pores. The roots of many of those which grow upon trees is perennial; of others merely annual.

When crude they are mostly poisonous, with a mucilaginous taste, which is often acrid, but they become less dangerous by cooking. The dangerous qualities of some of the kinds is attributable to the larvæ with which they are infested.

Division II. *Clavati*.

Receptacle long, simple, or branched, with a tendency to a cylindrical form, not margined. Hymenium superior. Asci fixed.

* *Hymenium occupying the whole surface. Asci distinct. No distinct stem.*

2379. *Clavaria*. Plant carnose, cylindrical, simple or branched. Hymenium smooth, occupying almost the whole surface, confluent with the stipes.

2380. *Calocera*. Plant branched or simple, cylindrical, homogeneous, corneous, gelatinous, viscid. Growing on wood.

** *Hymenium only occupying the end. Asci long. Head separate from stem, simple.*

2381. *Geoglossum*. Hymenium short, club-shaped, mostly compressed, stipitate. Stipes elongated, smooth or hairy. Plants black or dull green.

2382. *Spatularia*. Hymenium club-shaped, separate, compressed, running down the stipes on each side, bearing the asci at the upper end.

2383. *Mitula*. Hymenium clavate, ovate, closely surrounding at the base the stipes, which is distinct.

*** *Hymenium only occupying the end. Asci obsolete. Head separate from stem.*

2384. *Typhula*. Hymenium thin, subcylindrical, persistent, terminating the capillary stipes.

**** *Hymenium covering the whole surface, but bearing sporules at the end only, without asci.*

2385. *Pistillaria*. Simple, contiguous, linear or clavate. Sporida emerging at end.

Class II. UTERINI v. ELVELLACEÆ.

Hymenium distinct, superior, margined. Receptacle urceolate or reflexed, always inferior.

Division I. *Mitrati*.

Receptacle piliform, bullate, never closed. Hymenium neither margined nor discoid.

2386. *Morchella*. Pileus lacunose, confluent with the stipes either at the margin or a little above it. Hymenium occupying the whole outer surface.

2387. *Hetella*. Pileus submembranaceous, irregular, smooth on each surface, deflexed at the sides. Hymenium occupying the whole outer surface.

2388. *Verpa*. Pileus conical-deflexed, equal. Hymenium smooth or rugose.

2389. *Leotia*. Pileus ovate-conical or orbicular, wholly occupied by the hymenium, the margin free, but closely embracing the stipes.

Division II. *Cupulati*.

Receptacle cupulate, equal. Hymenium discoid, when young somewhat closed, surrounded by the margin of the receptacle.

2390. *Peziza*. Pileus mostly carnose, sessile or stipitate, more or less cup-shaped at length sometimes plane. Hymenium occupying the disk.

§ 1. *Aleuria*. Fleamy, or fleshy-membranous, pruinose or scurfy with flocculent matter, Usually on earth.

§ 2. *Lachnea*. Waxy, hairy or villous externally. Usually on wood.

§ 3. *Phialea*. Waxy or membranous, rarely gelatinous, smooth, naked. On wood.

§ 4. *Hectolium*. Plano-convex. On wood.

2391. *Ascobolus*. Pileus carnose, cup-shaped or hemispherical. Sporiferous cells in the disk, forming prominent points filled with a fluid intermixed with the eight sporules.

Observations.

Division II. *Clavati*. Scarcely any traces of these fungi can be discovered in the writings of the ancients. Clusius described a few. Tournefort confounded them with corals and Lycoperdons. Holmskiöld and Persoon are the principal modern writers upon this tribe.

Almost all the species of which there is any certain knowledge are European. The genuine kinds are terrestrial; those which are found upon wood, being transitory to other orders. In vaults or caverns they become unusually developed, and the asci, on account of the excessive supply of moisture, expand and become flocculent. Most are found in the autumn; the branched kinds are often what are termed meteoric, that is to say, spring up suddenly after heavy falls of rain. They seldom last more than fourteen days.

In qualities they are mild, some having a bitter taste, but the greatest number are almost entirely destitute of smell, color, or taste. Many of the large kinds are used in cookery, and are eaten by various herbivorous animals.

Class II. *Uterini*. The natural form of the receptacle is cupulate, but in the most perfect kinds, the cupula is reflexed, and is called a *mitra*; in the least perfect, which are innate in the matrix, the receptacle is almost wholly obliterated. The resupinate *Pileati* are distinguished from these by their immarginate form, and by their asci.

Division I. *Mitrati*. A small division, apparently wholly unknown to the ancients. The species are almost entirely European; a few are found in North America and Siberia. It is probable, however, from the evidence of Loureiro and others, that some peculiar genera and species exist within the tropics. They are generally fond of a humid shady station. None are found in subterraneous places. If an individual is occasionally produced upon wood, it is upon such as is wholly decayed. Many spring up in the autumn and spring; they are rarely meteoric, but some appear in greater abundance in one kind of season than in another. Most of them last for a fortnight, and retain their form when dry.

Their qualities are generally mild, nutritive, and juiceless; one is said to be bitter. They are little infested by larvæ. Several are used as food.

Division II. *Cupulati*. These are included in the Fungoides of the old botanists. The species which are separate from their thallus and much developed, are little changed by the places in which they grow, and are therefore the same in the most remote countries; but the eruptive or innate species, which are more affected by the nature of the substance by which they are fed, are liable to greater changes when their matrix is altered. For it is a general rule, that the more a fungus is innate in the substance which produces it, the more it is not only imperfect, but affected by its situation, and *vice-versâ*. Hence *Cœoma*, which is of a very low order, consists of as many species as the plants upon which it grows, just as a vowel forms as many distinct words as it is combined with distinct consonants.

The *Clavati* and *Pileati*, which chiefly depend upon the access of light, are in perfection from spring to autumn; the *Elvellaceæ* from autumn to spring. The *Cupulati* also depend much upon the operation of light, for in caverns or cellars they remain closed and spheria-like. Such is the case with *Peziza cerina*, which in dark places undergoes many metamorphoses; and *Cenangium* under similar circumstances, when some obstacle is offered to the development of its hymenium, becomes deliquescent. Generally the terrestrial sorts agree in habitude with the preceding divisions; but those which are eruptive are often in perfection for half a year together.

Class III. *Tremellini*. These are nearly akin to the *Pileati* and *Clavati*, especially to *Thelophora* and *Calocera*; and also to *Elvellaceæ*, more particularly to *Hygromitra*, *Peziza*, *Mollisia*, *Bulgaria*, and *Ditiotia*, but they are distinguished without difficulty by the characters assigned to them.

Formerly all the genera were confounded under one, along with various species of Lichens and Alga. These

2392. *Bulgaria*. Cupula closed at first. Asci immersed, with paraphyses, becoming separate and bursting out. Gelatinous.
2393. *Ditioda*. Hymenium becoming plaited and deliquescent. Cupula open. Veil universal. *Corky*.
2394. *Cenangium*. Hymenium smooth, persistent, rarely deliquescent. Cupula closed, but opening finally. Somewhat coriaceous.
2395. *Stictis*. Hymenium smooth, immersed. Cupula obliterated. *Hymenium persistent*.
2396. *Cryptomyces*. Spreading, quite adnate, emerging, nearly plane, carnosae. Hymenium covering the whole surface. Theca erect. Sporidia large, oval.

Class III. TREMELLINI.

Hymenium confounded with a gelatinous receptacle. Sporidia separate. Asci none.

2397. *Tremella*. Receptacle gelatinous homogeneous, fructifying in all directions, without papilla. Sporidia nearly emerging.
- § 1. *Coryne*. Fleishy gelatinous, somewhat clavate.
- § 2. *Phyllopta*. Somewhat cartilaginous, expanded, leafy.
2398. *Eridia*. Receptacle gelatinous, homogeneous, covered on the upper surface only by a papillose hymenium. Sporidia emitted with elasticity.
2399. *Dacrymyces*. Receptacle gelatinous, homogeneous, filled with assurgent flocci, and sporidia placed in layers inside. *When young compact, but finally deliquescent*.
2400. *Agrium*. Receptacle spherical, smooth, compact, waxy, when humid gelatinous, finally crumbling away in sporidia.
2401. *Hymenella*. Receptacle flattened, adnate, smooth, like soft leather, very thin, persistent.
2402. *Nematelia*. Receptacle gelatinous, surrounding a compact heterogeneous nucleus. Sporidia emerging.

Class IV. SCLEROTIACEÆ.

Hymenium confounded both with the fleshy receptacle and the sporidia. Asci none.

2403. *Acrospermum*. Elongated, somewhat clavate, with a coat of a similar substance, distinctly fructifying at the end.
2404. *Sclerotium*. Subglobose, or without regular form within, homogeneous, vesiculose, carnosae, or corneous. Sporules unknown.
2405. *Rhizoctonia*. Deformed, united with a similar persistent coat by means of root-like fibres proceeding from all points of its surface.
2406. *Periola*. Rootless, fleshy, covered entirely by a villous persistent coat.
2407. *Acinula*. Rootless, smooth, with a distinct farinaceous granular coat.
2408. *Erysiphe*. Sporangium epiphyllous, very minute, globose, furnished with white radiating subjacent filaments, and containing sporuliferous bodies.

TRIBE II. GASTEROMYCETES,

Fungus entirely closed, and bearing sporidia in the centre; and so forming an uterus.

Class I. ANGIOGASTRES.

Uterus finally bursting forth, separate from the receptacle. Sporidia lodged in the receptacle.

Division I. Phalloidæ.

Receptacle separate, open on account of the bursting of the uterus. Sporidia placed in a mucous layer.

2409. *Phallus*. Stipes issuing from a volva. Pileus furnished with large cells filled with a sporuliferous slimy substance.

Observations.

are by modern writers now referred to their proper stations. The genus *Mycoderma* of Persoon, to which are referred those tough skin-like coatings which are found upon vegetable extracts enclosed in bottles, and which is generally placed among Tremellini, is thought by Fries to be not of a vegetable nature.

The species at present known are found in Europe, Asia, and North America, but no material difference seems to be caused in them by their native country. All the species, with one exception, are epiphytes; the most perfect bursting forth from the bark of trees; the least perfect occurring on decorticated wood, the stems of herbs, &c. &c. The more the wood is dried, the nearer the species approach to Lichens; the more it is humid to Algae. They are in perfection in the latter part of autumn, winter, and early spring, but scarcely any are found in the summer. Some live for a month or more; others appear to be perennial. When dry they are not to be recognized; they may nevertheless be preserved, and if moistened, they recover their original appearance. It must be observed, that they are in all cases to be examined in a wet and humid state.

Their qualities are refrigerant, and but little known. They are destitute of smell and taste, for which reason, and on account of their mucilaginous texture, scarcely any species is eatable. Many of the large kinds were formerly used in medicine in cases of ophthalmia, under the name of the "Jew's ear." Vinegar in which they had been steeped was also used as a gargle in tumors of the throat, according to Celsus. *Tremella fibrinata* is said to furnish a dye, and the sporidia of *T. mesenterica* to dye yellow. *Dacrymyces* destroys timber.

Class IV. *Sclerotiaceæ*. The affinity of this class is complex; for the lower we descend, the less differences are to be found between natural bodies. Thus Sclerotiacei are not only closely connected with the preceding divisions, but have a more or less obvious relation to all the hymenial and epiphytous classes of other tribes.

Before the time of Tode, a most sagacious observer, who was the first to distinguish the Sclerotia from other fungi, a very few species only were known, which were confounded with *Lycopodium*, *Sphaeria*, *Tuber*, and other genera. He was followed by various other mycologists, and especially by Decandolle, who described thirty-nine species. Tode, Persoon, and Link, have been unable to detect any fructification; Decandolle, Ehrenberg, and Fries, declare that the sporidia are scattered through the whole mass of the fungus, and emerge from it like hoar-frost.

Most of the known species are epiphytes, either upon living or recently dead plants. When growing in cellars and subterraneous places they undergo no alteration, but they do not fructify. They flourish most in the winter, late in the autumn, and early in the spring; and are exceedingly common just at the retreat of winter. A very few Spermidia only are found in the summer. Their odor and smell are either inconspicuous or nauseous. None of the species at least are eatable. Those which grow on rotten seeds are exceedingly poisonous. Some feed on the roots of living plants, which they destroy; others infect sickly herds, whence they are a pest to the farmers.

Tribe II. *Gasteromyces*. These fungi consist of coarctate cells; they have a determinate figure and a tendency to a spherical form; at first they are closed, but finally are furnished with an orifice; or burst in an irregular manner, and emit an internal mass of reproductive matter, which either crumbles to pieces or deliquesces. The integument is of various natures, either a volva, a peridium, or perithecium, of a somewhat bladdery texture; and is simple or double, but rarely multiple. They almost all, when young, are flexible or soft, or have some part or another of a fluid nature; afterwards they become indurated and rigid, and assume their true forms.

Class I. *Angiogastres*. These are fungi of remarkable forms, and most unusual mode of fructifying; they were well known to Celsus, not to mention the celebrated Truffle of which Theophrastus had knowledge. They are found in different climates; but the most perfect only in temperate regions. The latter are also

2410. *Batarrea*. Head hemispherical, crumbling to pieces under the vertex into a little tuft of hairs bearing sporules. Stipes smooth. Involucrum triple, flowing with mucilage.

Division II. *Tuberaceæ*.

Sporangia membranous, scattered in an hymenium which is often grated with veins, and inclosed in the uterus. Sporidia pulpy at first.

2411. *Tuber*. Uterus closed, marbled with veins inside. Sporangia stalked, scattered among the veins. *Subterraneous.*

2412. *Rhizopogon*. Uterus sessile, bursting with irregularity, with anastomosing veins inside. Sporangia sessile. *Above ground.*

Division III. *Nidulariaceæ*.

Uterus filled with separate sporangia.

2413. *Nidularia*. Common peridium simple. Sporangia lenticular, fleshy, with sporidia in heaps in the middle.

2414. *Myriococcum*. Peridium simple, flocculent-furfuraceous, disappearing. Sporangia globose, with sporidia in round heaps.

2415. *Polyangium*. Peridium simple, membranous. Sporangia oblong, filled with a grumous mass.

Division IV. *Carpoboli*.

Uterus protruding a solitary separate sporangium.

2416. *Atractobolus*. Peridium cupuleiform, with a lid. Sporangium fusiform, with mucous sporidia.

2417. *Thelebolus*. Peridium sessile, urceolate-ventricose with an entire orifice. Sporangium papilliform, with mucous sporidia.

2418. *Pitobolus*. Stipes or receptacle pellucid, watery. Peridium a roundish vesicle, bursting elastically, placed on the apex of the receptacle.

2419. *Sphaerobolus*. Peridium double, both stellate; the inner membranous by inversion throwing out with elasticity a globose sporangium, bearing in the middle heaped sporidia.

Class II. PYRENOMYCETES.

Uterus genuine, forming the receptacle. Sporidia disposed in asci in regular rows.

Division I. *Sphæriacci*.

Perithecium closed, perforated by an orifice, filled by an ascigerous somewhat deliquescent nucleus.

2420. *Xylaria*. Receptacles stipitate, carnosae or suberosae. Spherules immersed in the receptacle, and containing a gelatinous sporuliferous mass.

2421. *Stromatosphaeria*. Receptacle sessile, free, or bursting from beneath the bark of dead wood. Spherules immersed.

2422. *Ucucurbitaria*. Spherules tufted, free, fixed on a receptacle, rarely at first included. Receptacle bursting through the bark.

2423. *Cyrtosphaeria*. Receptacle O. Spherules scattered or aggregate, lying beneath the epidermis or bark, orifice various more or less exerted.

2424. *Heterosphaeria*. (See Notes.)

2425. *Sphaeria*. Receptacle O. Spherules sessile on the surface or slightly immersed.

2426. *Lophium*. Perithecium vertical, compressed, dehiscing by a longitudinal somewhat closed cleft. Asci crumbling away.

Division II. *Cytisporici*.

Closed, perforated by an orifice. Asci none; sporidia surrounded by a little bag or thin cellule, deliquescent.

2427. *Sphaeronema*. Perithecium opening by a pore, enclosing in a very thin bag some mucous sporidia, which burst forth and become indurated in a globose form. *Naked.*

2428. *Septaria*. (See Notes.)

2429. *Cytispora*. Cellular-many-celled; cells deformed, membranous, united at ends. Nucleus gelatinous, filled with sporules, propelled through the common elongated orifice.

2430. *Phoma*. Nucleus grumous, enclosed in a tubercle. Sporidia emitted by a simple orifice without regularity.

Division III. *Phacidiacci*.

Perithecium finally bursting, with an open disk. Asci erect, fixed.

2431. *Dothidea*. Nucleus inclosing immersed cellules. True perithecium obliterated. Asci erect, remaining for a long time.

2432. *Rhizisma*. Perithecium deformed, bursting into transverse fragments by means of a flexuose crack.

2433. *Phacidium*. Receptacle O. Perithecia sessile, depressed, bursting from the centre towards the circumference in several acute segments. Sporuliferous cells elongated, fixed.

2434. *Hysterium*. Perithecia mostly oblong, black, corneous, bursting by a longitudinal slit. Sporuliferous tubes erect. (Crust none.)

Division IV. *Xylomacci*.

Asci obsolete. Sporidia innate.

2435. *Actinothyrium*. Perithecium buckler-like, with radiating fibres covering the fusiform sporidia.

2436. *Leptostroma*. Perithecium uniform, without an orifice, but entirely separating and exposing a very thin disk.

2437. *Xyloma*. Black, corneous. Perithecia single, solitary and minute, or united and confluent, irregularly dehiscant.

Observations.

terrestrial; the imperfect kinds being inhabitants either of plants or of the dung of animals. Many are meteoric, flourishing most in "Jove tonante, densisque cadentibus imbris;" others are ephemeral; some exist for a month and more.

The Phalloideæ are generally very fetid, cold, and venomous; one species is accounted in China a vulnerary, and also a food, but of doubtful quality. The old physicians had some peculiar notions about their use in arthritis, &c. but they are not worth repeating. The Tuberaceæ have a peculiar smell, which is often grateful; their taste is irritating; their qualities esulent, nutritive, and aphrodisiacal.

Class II. *Pyrenomycetes*. The affinity of this class is very complex, for which reason there is much difference of opinion among authors as to its limits. In fructification it approaches fungi of a higher degree of development; on one hand resembling the Angiogastres, from which it is readily distinguished by its separate receptacle; on the other hand, the Cupulati, whose differences depend upon the definition of their perithecium. In point of vegetation it descends, first, to Sclerotiaceæ, which are entirely different, in the absence of an uterus and nucleus; secondly, to Perisporia, which have no distinct perithecium, and no asci; and thirdly, to several genera of Coniomycetes.

2438. *Lasiobotrys*. (See Notes.)

2439. *Asteroma*. Black, minute, epiphyllous. Receptacle radiate, filamentous, very adnate, at length tubercled here and there.

Class III. TRICHOSPERMI.

Uterus genuine, forming a receptacle. Sporidia intermixed with flocci.

Division I. Lycoperdinei.

Uterus of a determinate figure, fleshy when young. Flocci copious.

2440. *Onygena*. Subglobose with a fibrous stipes. Peridium crustaceous, fragile, with interwoven fibres. Sporules naked, compactly clustered.

2441. *Tulostoma*. Globose stipitate. Involucrum none. Peridium opening by a bordered pore in the summit. Sporules scattered in it.

2442. *Scleroderma*. Sporangium globose or prolonged into a stipes. Peridium single, coriaceous, mostly warty, bursting at the apex or sublehiscent. Sporules collected into little contiguous distinct globules mixed with filaments.

2443. *Lycoperdon*. Sporangium globose. Peridium single, membranaceous, scaly, with warts or soft spines bursting irregularly at the apex, and containing a mass of sporules and filaments.

2444. *Boeisia*. Sporangium globose. Peridium double; the outer one adnate, cracking, somewhat fugacious; inner one bursting at the apex, and containing a mass of filaments and pediculated sporules.

2445. *Genstrum*. Globose sessile. Involucrum coriaceous, stellate. Peridium membranous. Sporules on stalks from the first.

Division II. Trichocisti.

Uterus regular, when young pulpy. Sporidia having numerous flocci scattered among them.

2446. *Craterium*. Peridium oblong, stipitate, operculate, containing a cellulose, filamentous, sporuliferous mass.

2447. *Stemonitis*. Cylindrical or subglobose. Peridium fugacious. Filaments forming a reticulated mass, perforated by the stipes to which they are attached. Sporules intermixed.

2448. *Cribbraria*. Globose stipitate. Peridium crumbling to pieces at the summit in cracks.

2449. *Dictydium*. Globose stipitate. Peridium crumbling to pieces entirely or for the most part.

2450. *Arscuria*. Mostly cylindrical. Peridium fugacious, except a small portion at the base. Filaments abundant, reticulated, fixed at the base. Sporules intermixed.

2451. *Leangium*. Minute subglobose. Peridium single, membranaceous, bursting into subregular, persistent, expanding segments. Filaments attached at the base and surrounding a columella.

2452. *Trichia*. Minute subglobose or irregular. Peridium single, membranaceous, bursting. Filaments involute attached at the base, and expanding elastically.

2453. *Diderma*. Minute subglobose. Peridium double; the outer one fragile and fugitive. Sporules mixed with a few filaments and surrounding a roundish columella.

2454. *Physarum*. Sporangium minute, mostly stipitate, subglobose. Peridium single, membranaceous, bursting and deciduous in distinct portions. Sporules mixed with a mass of filaments.

2455. *Leocarpus*. Minute. Peridium single, fragile, bursting, sessile or substipitate, containing a black mass of sporules mixed with a few filaments. Columella 0.

Division III. Fuliginoidi.

Uterus somewhat deformed, sessile, when young pulpy. Sporidia separated by flocci.

2456. *Lycogala*. Sessile globose or subirregular, pulpy when young. Peridium single, fragile, variously dehiscent. Sporules mixed with a few filaments.

2457. *Spumaria*. Form irregular, roundish, effused. Peridium soft, at length membranaceous, fragile. Sporules contained in the folds of branched, elongated, membranaceous, persistent processes.

Division IV. Liccoidei.

Flocci obsolete.

2458. *Dichosporium*. Flattened hemispherical. Peridium membranous, coated with a layer of granules. Sporules in globose masses.

2459. *Licca*. Peridium membranaceous, sessile, fragile, inclosing a pulverulent mass of sporules unixed with filaments. (No subjacent membrane.)

Class IV. MUCOROIDEI.

Peridium formed of flocci loosely woven together, vanishing in the middle. Sporidia in heaps.

2460. *Mucor*. Peridium membranaceous, globose, stipitate, pellucid, at length opaque. Pedicel simple or branched, tubular, articulated.

2461. *Tharandium*. Stipes branched at base; branches bearing solitary globules at their end. Peridium globose.

2462. *Ascophora*. Peridium membranaceous, stipitate, bursting at length, turned inside out, convex and subsistent. Pedicel simple or branched, tubular, pellucid, articulated.

Class V. PERISPORIA.

Perisporium thin, somewhat membranous, bursting. Sporidia immersed, scarcely distinct.

2463. *Eurotium*. Peridia membranous, subglobose, with an articulated flobose innate receptacle. Sporules naked in masses.

2464. *Amphisporium*. Subglobose. Peridium membranous, thin. Sporules naked of two forms.

Observations.

Its extent is very great, ascending from the most simple forms to those which are very compound, but at the same time connected with the former by the most strict natural ties. The true place of the genera in the system has been a subject of doubt. Many authors have taken them for fungi in the most perfect state. Decandolle excludes them from fungi, and, with some analogous Lichens, refers them to a peculiar intermediate family.

They are found in every part of the world in which vegetation exists; for every perfect plant and all its decaying parts nourish Pyrenomyces. The chief families of trees in the European Flora upon which they flourish are Coniferae, Amnatae, Rosaceae, Ericae, Rhamnoidae, Acerinae, and Tiliaceae, and of herbs, Graminae, Umbelliferae, and Liliaceae. Many are peculiar to certain species of trees, and others are common to many species. For example, on the *Betula alba* may be found about ten peculiar species, and from forty to fifty which are common to it and other trees. Their qualities are unknown. Many species which are included by Fries under the name of *Ectostroma*, are probably not vegetables, and are here omitted.

TRIBE III. HYPHOMYCETES.

Thallus flocculent.

Class I. CEPHALOTRICH.

*Receptacle distinct, covered over with flocci, with sporidia scattered among them.*2465. *Ceralium*. Filaments very short, pellucid, simple, minute, attached to a membranaceous, plicate simple or branched, filiform receptacle.2466. *Isaria*. Filaments minute and pellucid, attached to an elongated, simple or branched, clavate, carnosose receptacle.

Class II. STILBOIDEI.

*Fibres grown together upon the receptacle. Sporidia inclosed in a separate naked head.*2467. *Stilbum*. Minute. Stipes slender, bearing a little round solid head, which is pellucid and semifluid at first, at length more dense and opaque.

Class III. INOMYCETES.

Fibres genuine, somewhat separated by divisions. Receptacle none. Upon putrescent organic matter.

Division I. Byssacei.

*Opaque fibres, bearing sporæ inside, when fertile jointed, when sterile contiguous. Repeat moisture.*2468. *Torula*. Thallus composed of branched, rigid, fragile, moniliform, subopaque filaments, the articulations minute, globose.2469. *Monilia*. Fibres numerous, erect, opaque, distinctly articulated, permanent. Articulations ovate.2470. *Racodium*. Thallus composed of branched, decumbent, interwoven, jointless, persistent, subopaque filaments, among which are sometimes granules of moniliform filaments.2471. *Dematium*. Fibres decumbent or ascending, rigid, opaque, branched, continuous in all directions, permanent.2472. *Cladosporium*. Thallus composed of erect, rigid, subopaque, jointed, simple or branched, aggregate filaments. Sporules ovate, attached in a series to the filaments, deciduous.2473. *Helicosporium*. Fibres erect, rigid, nearly simple, opaque. Sporules spiral, remotely jointed, some that are fugacious scattered among them.2474. *Ozonium*. Thallus composed of decumbent, branched, entangled filaments: primary ones thick, irregular; ultimate ones fine-jointed.2475. *Rhizomorpha*. Receptacle much branched, elongated, coriaceous or ligneous. Perithecia arising from the branches, mostly clavate, dehiscent at the apex.

Division II. Mucedines.

*Flocci pellucid, with disseminations, bearing sporæ on the outside.*2476. *Sepedonium*. Thallus formed of entangled filaments, spreading within putrefying fungi. Sporidia scattered, globose. (Bright yellow.)2477. *Acremonium*. Thallus composed of decumbent, entangled, branched, pellucid filaments. Sporidia globose, solitary, pedicellate.2478. *Sporotrichum*. Thallus minute, tufted or expanded. Sporidia scattered among the branched, tubular jointed filaments.2479. *Trichothecium*. Filaments minute, branched, forming a tufted thallus. Sporidia scattered, subglobose, ditlymous.2480. *Acrosporium*. Thallus composed of minute, tufted, pellucid, moniliform, simple filaments, the uppermost joints (sporidia) separating spontaneously.2481. *Botrytis*. Thallus composed of decumbent, entangled, branched, pellucid filaments. Sporidia globose, solitary, pedicellate.2482. *Aspergillus*. Thallus composed of minute, pellucid, scattered or tufted filaments, apex of the main filament mostly clavate, on which is a head of (often beaded) sporidia.2483. *Stachylidium*. Thallus composed of tufted, pellucid filaments: sterile ones procumbent; fertile ones erect, whorled, with ramuli near the top, among which the sporidia are collected.2484. *Penicillium*. Thallus composed of tufted, pellucid filaments: sterile ones procumbent; fertile ones erect, bearing a terminal pencil-like tuft of erect ramuli, to which the sporidia are attached.2485. *Trichoderma*. Sporidia collected in the centre, free, the filaments woven into a web-like covering, at length opening at the apex and discharging the globose sporidia.

Class IV. PHYLLERIACEÆ.

*Fibres spurious, contiguous, bearing sporæ inside. Receptacle none. On living leaves.*2486. *Rubigo*. Fibres infundibuliform or clavate, twisted, situated in patches upon sickly leaves.2487. *Erincum*. Peridia flocciform, subdiaphanous, various, subsimple, aggregato-capitate, parasitic on living leaves. Sporules sometimes, but rarely evident.

TRIBE IV. CONIOMYCETES.

Sporidia naked, without any heterogeneous receptacle.

Class I. TUBERCULARIÆ.

*Sporidia naked, simple, scattered over the receptacle.*2488. *Tubercularia*. Sporangium subglobose, sessile, or somewhat stipitate, carnosose-vesiculose (not gelatinous). Sporidia towards the circumference (color mostly red).2489. *Fusarium*. Minute, subglobose, naked, almost wholly formed of fusiform, free, jointless spoudia.2490. *Exosporium*. (See Notes.)*Observations.*

Tribe III. *Hyphomycetes*. Distinguished from other tribes by their flocculent thallus. In no other tribe do flocci occur in so perfect a state of development, although they undoubtedly exist as subordinate organs in the Uterini and Hymenomyces.

Class IV. *Phylleriaceæ*. These are perhaps morbid states of the outer integuments of plants. This at least seems obvious in *Phyllerium Rubi*, Gei, &c. which are nothing but the hairs of the leaves in a clustered and somewhat altered form. This also may be the reason why there are no sporidia.

Tribe IV. *Coniomycetes*. To this are referred those fungi in which the sporidia are of a more obvious nature than the other parts of the plant, and so constitute the essence of the fungus. Hence they are more evolved than in any other class. The receptacle, if present, arises either out of united pedicels, or of united sporidia,

Class II. ENTOPHYTE.

*Sporidia naked, separate, without a receptacle.*Division I. *Stilbospori.**Entophytes growing upon dead plants.*

2491. *Fusidium*. Thallus plane, effused. Filaments short, branched. Sporidia fusiform, scattered.
 2492. *Polythrincium*. (See Notes.)
 2493. *Stilbospora*. Black. Receptacle O? or a pulverulent mass intermixed with naked sporidia, the whole bursting through the bark in the manner of a Stromatosphæria.
 2494. *Sporidermium*. (See Notes.)
 2495. *Næmospora*. Receptacle O. Spherules obvious, or somewhat obsolete, discharging sporuliferous pulp through the bark in the form of tendrils.

Division II. *Hypodermia.**Parasites upon living plants.*

2496. *Cylindrosporium*. Very minute, parasitic on the surface of living leaves. Sporidia pellucid, cylindrical, truncate, free, not divided.
 2497. *Uredo*. Epidermis of the leaf forming a pseudo-peridium. Sporidia 1-celled, free, mostly globose.
 2498. *Æcidium*. Peridium membranaceous, bursting through the epidermis, and dehiscent at the apex, with a dentate or lacerate orifice.
 2509. *Puccinia*. Epidermis of the leaf forming a pseudo-peridium. Sporidia fixed by a pedicel, one or many-celled.

Observations.

and is homogeneous with the immature sporidia. The thallus is never flocculent. The organs of nutrition and reproduction are the same.

Division II. *Hypodermia*. The genera of this division are furnished with a caliculus, which must not be confounded with the receptacle or thallus, &c. of other tribes, because it does not constitute part of the fungus, but is formed out of the epidermis of the plant on which the fungus grows.

HYMENOMYCETES.

History, Use, Propagation, Culture,

2365. *Agaricus*. This, the most extensive genus in the vegetable kingdom, derives its name from *Agaria*, a kingdom of Sarmatia. The species are determined upon various principles. Some writers have mixed together species of the most different kinds, as Gleditsch; and a few writers only have really taken pains to ascertain the species. If it is divided into many genera it would be necessary to break up *Boletus* also, which would scarcely be judicious. An accurate and simple mode of division is, however, of the utmost moment, and several methods have been proposed, the greater part of which are artificial, and therefore objectionable; such, for example, as that of Villars, from the magnitude of the species; of Linnæus, from the color of the pileus; of Haller, from the color of the lamellæ or gills; of Withering, from the nature of the stipes and the color of the lamellæ taken together; or of Otto, from the position of the lamellæ. The divisions of Fries, which are all named as subgenera, depend upon the characters of the veil, the lamellæ, the sporidia, and the pileus. Our notes will follow these in their order of succession.

§ 1. *Ananita*. This name was applied by Galen to some eatable fungus, and has been restored in modern days by Persoon. Most of the species are poisonous. They do not perish quickly, and are found for the most part on damp earth in shady woods, never upon wood or the dung of animals. They are in perfection about the end of summer.

A. vaginatus is eaten by the Muscovites; but in the Jena Literary Gazette of 1819, it is declared to be poisonous. *A. ovoideus* is said to be delicious.

A. muscarius, or reddish mushroom, has a large pileus, varying much in color, white, red, or crimson, convex, sprinkled with downy warts, which are raised, compact, and angular, or thin, flat, and ragged, turning up with age, from two to seven inches over; flesh white, reddish in decay; gills fixed, white, yellowish with age, mostly uniform, but a shorter one sometimes intervening; the shorter gills varying much in length, but rarely less than one-third the length of the long ones; the stem solid and cylindrical, but the internal substance shrivelling with age leaves irregular hollows; scaly, bulbous at the base, from three to five inches high, and from three quarters to one and a half inch in diameter; ring broad, permanent, and turned down upon the stem. This plant rises out of the ground inclosed within its brown studded wrapper. It is found in pastures. The juice rubbed on the walls and bed-posts destroys bugs; and in the North of Europe, the inhabitants infuse it in

HYMENOMYCETES.

Class I. HYMENINI. — Div. I. *Pilcati.*

* *Volva loose* : edge of the cap smooth. UNWHOLESOME.

- 15731 Cap somewhat scaly : edge smooth, Stipes solid nearly equal, Volva loosely sheathed
 15732 Cap somewhat scaly : edge smooth, Stipes hollow at top, Volva connate bulbous

15733 Cap naked : edge smooth, Stipes somewhat fistular equal, Volva booted

** *Volva loose* : edge of the cap striated. EATABLE.

15734 Cap furrowed at edge, Gills white, Stipes fistular tapering nearly naked, Volva sheathing

15735 Whole plant white, Cap plane or slightly umbonate : the centre often pale ochraceous ; margin striato-pectinate, Lamella somewhat distant, Stipes solid naked bulbous

*** *Volva obliterated* : edge of the cap striated. POISONOUS.

- 15736 Margin of the cap striated orange-red shining warty rarely naked, Volva vanishing scaly, Stipes bulbous
 15737 Cap equally warted : edge striated, Stipes nearly solid equal, Volva booted adnate

**** *Volva obliterated* : edge of the cap smooth. UNWHOLESOME.

- 15738 Warts of cap mealy unequal : edge smooth, Flesh pink, Stipes solid somewhat scaly and bulbous
 15739 Cap somewhat umbonate rough with acute warts : edge smooth, Stipes solid somew. taper. squarrolous

* *Veil finally separate*, Gills distant. EATABLE.

- 15740 Large, Cap scaly, Lamella distant white, Stipes very long bulbous, Collar free
 15741 Skin of cap contiguous, Lamella remote, Stipes equal, Collar free

** *Veil fixed*, Skin of the cap peeling off, Gills separate.

15742 Inodorous, Cap with the epidermis broken into ferruginous scales, Lamella white numerous, Stipes subsquamose, Collar mostly fugacious

15743 Highly odor. Surface of cap white with reddish scales, Lamella distinct, Stipes smooth, Collar fugacious

*** *Veil fixed*, Gills separate, Skin of the cap adhering.

15744 Cap glutinous striated at edge, Lamella loose, Stipes viscid on account of the veil

and Miscellaneous Particulars.

milk, and set it in their windows in order to poison the flies who taste it. This is *moucho-more* of the Russians, Kamtehadales, and Koriars, who use it for intoxication. They sometimes eat it dry, and sometimes immerse it in a liquor made with the epilobium ; and when they drink this liquor, they are seized with convulsions in all their limbs, followed with that kind of raving which attends a burning fever. They personify this mushroom ; and if they are urged by its effects to suicide, or any dreadful crime, they pretend to obey its commands. To fit themselves for premeditated assassination, they recur to the use of the moucho-more. A powder of the root, or of that part of the stem which is covered by the earth, is recommended in epileptic cases, and externally applied for dissipating hard globular swellings, and for healing ulcers. The dose is from half a scruple to one, taken three a day in water ; but a dram administered once a day in vinegar has been thought more efficacious. *Murray, App. Med. vol. v. p. 500.* Dr. Withering enumerates ten varieties of this species.

§ 2. *Lepiota.* Terrestrial, solitary, persistent, autumnal fungi, none of which are noxious. Named from λειπίς, a thin membranous layer or cuticle. The *A. procerus*, or tall mushroom, is not uncommon on hedge banks and dry pastures, and is sometimes exposed to sale in Covent Garden market. It may be distinguished from the genuine sort by the sponginess of its flesh ; and from others by its fine and large horizontal ring. The gills are white, uniform, and fixed to a collar ; the pileus is a broad cone, bossed white-brown, and scaly ; the stem is scaly, and the ring loose. This plant, when preserved in pickle, is very apt to run into the vinous fermentation.

A. xerampelinus is the most splendid of all the agarics. Its gills are fixed, bright golden-yellow, and nearly orange under the edge of the pileus, regularly disposed four in a set ; fleshy, brittle, and serrated at the edge with a paler cottony matter : the pileus is a fine lake-red, changing with age to a rich orange and buff, and every intermediate shade of these colors, which render it very beautiful ; convex, center bossed, edge turned down, three to four inches in diameter, cloth to the touch ; flesh pale-buff : stem solid, nearly cylindrical, but gradually tapering upwards, rich buff, shaded with fine rose-red, three to five inches high, half inch in diameter ; flesh pale, buffy, spongy, and elastic. This is common in Italy, and brought to the markets for sale. The ancient Romans esteemed it one of the greatest luxuries for the table. It was made the vehicle for poison to Claudius Caesar by his wife Agrippina, and has therefore been celebrated by Juvenal and Martial.

History, Use, Propagation, Culture,

Schæffer and Clusius have recited several curious circumstances respecting it. Dr. Withering apprehends that these authors have mistaken the species, and that their account should be transferred to the *A. deliciosus*. The *A. xerampelinus* is eatable, but its taste is not at all agreeable. It is the *A. caesareus* of Schæffer, and first found by Dr. Withering's daughter on the red rock plantations at Edgbaston, July 6th, 1791, and afterwards in September 1793; and in July 1792, among moss in the fir plantations at Tattenhall, Staffordshire. Dr. W. enumerates five varieties.

§ 3. *Armillaria.* From *armilla*, a necklacc. Autumnal species, of permanent duration, firm, and esulent.

**** *Veil fixed, Cap covered, Gills somewhat united.*

15745 Cap with furfuraceous scales reddish-yellow, Lamellæ fixed white, Stipes subsolid covered below the veil with squarrose scales

* *Cæspitose, Cap smooth.*

15746 Somew. cæspit. Cap thin glutin. Lamellæ annex. dist. Stipes bulb. Collar reflex. and then erect furrowed

** *Cæspitose, Cap not smooth.*

15747 Cap dull-yell. rough with black. hairy scales, Lamellæ adnate-decurr. dist. Stipes fibrous, Coll. tum. spread.

* *Cap smooth, floccose at edge. UNWHOLESOME.*

15748 Cap smooth whitish, Margin and top of stipes yellow-flocculent with crisp lamellæ

15749 Cap smooth whitish-pink : edge involute downy, Lamellæ straight, Stipes thickened upwards scaly

** *Cap smooth, Stalk scaly. EATABLE.*

15750 White, Cap smooth umbon. Lamellæ broad dist. very decur. Stipes white scurfy solid becom. hull. in age

*** *Cap finally depressed, Stalk spotted.*

15751 Cap umbonate smooth olive-brown, Lamellæ connected white, Stipes solid mottled with brown [yellow

15752 Cap obt. smooth yellow. covered by an olive-colored gluten, Lamellæ distinct and stipes (which is spotted)

15753 Cap smooth cinnamon-col. Lamellæ somewhat decurrent and hollow, Stipes spotted rufous

* *Cap truly fleshy, somewhat blunt, humid, viscid ; with an involute downy edge, Gills white or yellow, emarginate, Stalk clothed, separate from the cap.*

15754 Cap smooth viscid amber-col. Lamellæ annexed white, Stipes solid smooth scaly at end

15755 Cap viscid virgate rufous brown discoidal, Lamellæ annexed yellow, Stipes hollow equal fibrous

15756 Cap smooth viscid red-brown, Lamellæ emarginate white, Stipes equal solid fibrous

15757 Cap somew. depress. viscid granul. and solid stipes eq. scaly at end rose-color. Lam. somew. separate white

15758 Cap somewhat scaly viscid yellow-orange, Lamellæ adnate white, Stipes solid covered with orange scales

15759 Cap scaly viscid yellow-green, Lamellæ separate yellow, Stipes solid thick tuberous

15760 Cap flexuose virgate viscid lurid, Lamellæ emargin. broad and solid, Stipes somew. scaly yellowish-white

15761 Cap flexuose smooth greenish ash-colored, Lamellæ emarginate narrow yellowish, Stipes solid scaly pallid

** *Cap always dry, scaly, with the young edge involute, downy, or villous, Gills separate or emarginate, Stalk scaly, separate from cap.*

15762 Cap comp. flexuose somew. scaly yellow-brown, Lamellæ emarg. comp. and solid, Stipes scaly sulphure.

15763 Cap obt. convex deep-yellow more or less covered with crimson red squamulose fibres, Lamellæ rounded numerous yellow, Stipes solid or partly hollow streaked with red

15764 Cap umbon. rufous, Skin torn with hairy scales downy at edge, Lamellæ affixed whit. Stipes holl. fibrous

15765 Firm, Cap dry smooth a little scaly brownish-livid, Lamellæ emarg. somew. dist. whit. Stipes solid uneq.

15766 White, Cap irregular becoming scaly and cracked, Lamellæ emargin. compact, Stipes solid short smooth

*** *Cap always dry, smooth, but often fibrillose, with a naked edge, Gills separate or emarginate, Stalk solid, smooth, striated, separate from the cap.*

15767 Cap umbonate dry yellow-brown fibrous towards edge, Lamellæ emarg. broad and solid striat. Stipes yell.

15768 Cap somew. umbon. dry yellow streaked with black hairs, Lamellæ emargin. broad and solid, Stipes white

15769 Cap umbonate dry grey streaked with black, Lamellæ emargin. broad hoary, Stipes solid striated whitish

**** *Cap always dry, smooth, with a thin, floccose, frosted, involute edge, Flesh soft, Gills rounded, clustered, obliterated in front, Stalk united with cap.*

15770 Somew. cæspitose, Pileus smooth unequal cinereous, Lamellæ round. white, Stipes solid powdery at end

15771 Somew. cæspitose, Pileus compact smooth mouse-colored, Lamellæ emarg. and solid downy, Stipes white

15772 Cap somewhat compact smooth with a villous frosted margin, Lamellæ rounded loose and solid somew. bulbous villous, Stem rather violet

15773 Gregarious, Cap thin smooth lilac-brown, Lamellæ rounded pale violet, Stipes solid equal naked

15774 White not spotted, Cap equal smooth, Lamellæ rounded dense, Stipes solid elastic

15775 Cap conical shining, Lamellæ loose white, Stipes solid white

* *Gills all equal, Sporidia yellow.*

15776 Cap somewhat compact : the margin finally furrowed, Lamellæ broad equal tanned
β Stipes yellow

15777 Middle-sized, Margin of cap smooth, Lamellæ narrow compact equal : the color of yolk of egg

15778 Cap thin with a sulcate margin, Lamellæ broad subsistant equal yellow

and Miscellaneous Particulars.

They differ much in habit among each other. The annulus is either *superior*, that is reflexed from the top of the stipes ; or *inferior*, that is contiguous to the middle ; or even *proper*, being inserted above the middle

§ 4. *Limacium*. So called from *A. limacinus*, a name which has been indiscriminately applied to almost all the species of this subgenus. They are fungi of a middle size, solitary, terrestrial, autumnal, and permanent.

§ 5. *Trichotoma*. From *Trich.*, hair, and *τομα*, a margin. The species are large, robust, and permanent, solitary or gregarious, and terrestrial. Many are eatable ; some have an acrid bitter flavor. A *Russula* is said to be of excellent quality.

History, Use, Propagation, Culture,

§ 6. *Russula*. So named from the russet color of the original species. The species are all large, or of middle size, rigid, persistent, solitary, terrestrial, chiefly appearing in the autumn.

§ 7. *Galarhæus*. From *γαλα*, milk, and *hæus*, to flow; many of the species being lactescent; some are juiceless. These are fungi of the summer and autumn, possessing an aromatic smell and acid flavor. They all grow upon the ground. A. torminosus, in times of scarcity, is eaten by the Russians, mixed with salt, oil, and vinegar. *Buch*. A. controversus is stated by Persoon to be eatable; but Fries thinks it must be in mistake. A. deliciosus has gills decurrent, flame-colored, narrow, regularly branched; pileus rich, red, brown; flesh nearly flat, but somewhat hollowed at the centre, and the edge turned in from one and a half to three inches over; orange-color; stem orange, solid, tapering downwards, from one to two inches high, and a quarter to three-eighths high; hollow with age. The juice is rich yellow, which soon turns green. It is found in the fir plantations of Scotland, and in those of the barren hills at Barr, in Staffordshire. Dr. Smith also found it at Hillingdon, Middlesex, under some fir trees; it also grows near Guildford. It is much esteemed in Italy, and exposed in the markets, and supposed to have been the A. cæsareus mentioned by some authors.

15779 Cap compact somew. depressed in centre with marg. at length sulcate, Lamellæ broad subeq. very white

** *Gills nearly equal, Sporidia white.*

15780 Cap deformed opaque pallid; margin finally striated, Lamellæ distinct whitish, Stipes finally cinereous

*** *Gills forked, and many of them halved.*

15781 Very hot, Cap very red: margin smooth, Lamellæ forked white

15782 Acid stinking, Cap yellow: margin warted furrowed, Lamellæ connected and hollow, Stipes white

15783 Scentless, Cap greenish: margin smooth, Lamellæ forked white [thick. Stipes short solid very robust

15784 Large, Pileus depress. ash color: margin finally dark and as if burnt: marg. smth. Lam. uneq. dist. white

β Cap brownish-yellow, Lamellæ yellowish-white, Stipes solid white

* *Edge of the cap rolled inwards, downy. HOT. POISONOUS.*

15785 White, Pileus villous blood-red variegated downy at edge, Stipes solid

15786 Cap yellow without zones: margin bearded, Milk yellowish, Stipes hollow spotted

15787 Cap glabr. pale with a yellowish brownish or greyish tinge: marg. toment. Stipes most. holl. in part smth.

15788 Cap smooth zoned olive-brown: margin villous, Stipes solid

15789 Cap downy dull flesh-colored, Lamellæ yellowish, Stipes rather hollow

** *Cap smooth, viscid, with a naked edge. HOT. EATABLE.*

15790 Cap viscid zoned lurid, Lamellæ white, Milk reddish, Stipes hollow

15791 Cap viscid not zoned cinereous-sooty, Lamellæ yellow, Milk turning red, Stipes solid

15792 Cap viscid not zoned fleshy livid or brownish, Lamellæ white, Milk whitish-lilac, Stipes hollow

15793 Cap thin smooth somew. viscid not zoned livid pale, Lamellæ and milk whit Stipes somew. hollow fragile

15794 Cap viscid not zoned smooth flesh-colored, Lamellæ and milk white, Stipes hollow spotted

15795 Cap viscid somewhat dripping not zoned greenish, Lamellæ and milk white

15796 Cap viscid smooth not zoned and stipes (which is short) hollow and firm pallid, Lamellæ and milk white

15797 Cap glutinous obscurely zoned dingy-orange or reddish very pale when dried, Lamellæ and juice orange,

Stipes becoming hollow glabrous

15798 Cap somew. viscid not zoned orange-colored, Lamellæ compact yellowish, Milk white, Stipes long smooth

*** *Cap dry, naked at edge, Gills close, when young white, afterwards yellow. EATABLE but ACRID.*

15799 Sweet, Cap papillose smooth dry orange-colored, Lamellæ paler, Milk white, Stipes long hollow

15800 Sweet, Cap obtuse smooth dry opaque, Lamellæ testaceous rufous, Stipes solid firm brownish

15801 Cap glabrous polished reddish, Lamellæ flesh-colored at length ferruginous, Juice white not changing

color, Stipes firm smooth becoming hollow

15802 Somewhat acid, Cap dry smooth somewhat zoned rufous brown, Milk yellow, Stipes solid

15803 Acid, Cap dry smooth obsolete zoned pale-yellow, Lamellæ pale flesh-color, Stipes solid

15804 Very acrid, Cap dry umbonate polished reddish-brown, Lamellæ rufous, Milk white, Stipes solid

15805 Acid, Cap bluntish scaly dry red-ochre-colored, Lamellæ ochraceous, Stipes nearly solid

15806 Cap thin scaly dry opaque somewhat lurid

15807 Cap large dry zoneless dark fuscous or deep dingy-grey, Lamellæ yellowish rather numerous, Juice white

**** *Cap dry, naked at edge, Gills not altering, Substance compact, tough. VERY ACRID.*

15808 Cap dry smooth somewhat zoned livid, Lamellæ distant yellow, Stipes hollow cinereous

15809 Cap repand dry smooth, Lamellæ distant pallid, Stipes short pallid

15810 Cap depress. becom. infundibulif. glab. whit. Lamel. very narrow crowded, Stipes solid white thick, Juice

15811 White, Cap umbilicate downy rigid, Lamellæ narrow distant, Milk white, Stipes solid thick

15812 All white sweet, Cap convex, Stipes long

15813 Seems to be a green variety of *A. hygynus*, with a solid stipes

A. *Gills equally narrowed backward, acute.*

1. *Cap dry, smooth, Gills close, decurrent or acutely adnat.*

* *Cap more or less fleshy; when young convex-deflexed, when older depressed, Gills truly decurrent.*

15814 Very large whitish or very pale brown, Cap becoming infundibuliform, Lamellæ numerous decurrent becoming reddish, Stipes solid very thick

and Miscellaneous Particulars.

Dr. Withering enumerates three varieties, one of which affords, from every part of it when wounded, a copious discharge of yellow acrid juice. They are gathered in woods and dry pastures in September and October.

Lösel asserts in his *Flora Prussica*, p. 82., that "the juice of *A. piperatus*, mixed with the syrup of mallows, is a certain cure for calculus, and a powerful diuretic." Almost all the venomous fungi, and especially those of the present group, are said to be the favorite food of the goat, during the rutting season. It is sometimes monstrous and irregular. Withering mentions their attaining the diameter of ten inches. The stipes is not unfrequently thicker than it is long. It has been used in medicine, and thought useful in dissolving calculi; a property we may safely venture to deny it.

§ 8. *Citocybe*. From $\alpha_1\gamma_1\eta_1$, inclined, and $\alpha_2\epsilon_1$, a head. Most of the species are harmless, and of the larger size. *A. nebularis* is eatable, so also is *A. fusipes*. *A. giganteus* is one of the species which form those circles known by the name of *Fairy-rings*, the origin of which is still as obscure as ever.

A. oreades has loose gills, with the part attached to the pileus jutting up very close to the stem, so as to give

History, Use, Propagation, Culture,

them almost the appearance of being fixed, watery, brownish-white, two or four in a set, the small ones very minute, and the large ones sometimes splitting at the outer end; not numerous, rather broad for the size of the plant, frequently connected to the pileus by ligaments; pileus pale, buffy-brown, convex, irregular, with a sudden depression of the border at some distance from the centre, often giving the appearance of a large rounded boss in the middle; central cone generally deeper; from one to one and three-quarters inch over; and the edge turning up with age; stem solid, white, changing to watery-brown, cylindrical, but thicker and flattened just under the pileus, very tough, mostly crooked, twisted when dry, rarely central, one and half inch high, and thick as a crow-quill. This is the twenty-seventh fungus of Ray's Synopsis, ed. 3. p. 6.; A. pratensis of Hudson, and coriaceus of Lightfoot. There are two varieties; one with cream-colored gills, buff pileus, and mealy stem; and another with yellow-brown, more fleshy, and more regularly convex pileus, found in groves. Mr. Woodward says, that this species has a much higher flavor than the common mushroom, but he suggests,

- 15815 Large, Cap convex umbonate at length infundibuliform smooth firm yellowish-white, Lamellæ numerous decurrent whitish, Stipes straight solid subradicating
 15816 Cap thin funnel-shaped obt. smooth flaccid, Lamellæ decurr. whit. Stipes solid thickened at base villous
 15817 Cap umbonate smooth becoming funnel-shaped, Lamel. decurr. white, Stipes solid elastic taper. upwards
 15818 Cap depressed broad zoned brown irregular, gills decurrent pallid, Stipes solid
 15819 Cap flat, somew. umbilic. smth. a lit. flesh-color. : when dry whit. Lam. decurr. and solid eq. Stipes white

** Cap closely fleshy, convex, opening out flat, Gills truly decurrent, Stalk strong. EATABLE.

- 15820 Cap compact smooth emereous, Lamellæ slightly decurrent compact whitish, Stipes solid tapering upw

- 15821 Cap plano-convex very smooth greyish-brown, Lamellæ narrow numerous pale, Stipes hollow stout

*** Cap truly but not firmly fleshy, flatish or slightly depressed, Gills adnate, not properly decurrent, Stalk slender.

- 15822 Cap smooth green, Lamellæ adnate narrow, and stipes (which is solid and smooth) white
 15823 Fragrant smooth dull bluish-green umbonate convex becoming plane, Lamellæ numer. adnato-decurrent
 15824 Shining-white, Cap smooth convex then umbonate, Lamel. adnate then decurr. Stipes fistulose smooth
 15825 Scentless white, Pileus unequal thin smooth, Lamellæ adnate numerous, Stipes solid equal glabrous

- 15826 Cap obsolete umbonate smooth, Lamellæ adnate close white, Stipes solid furrowed smooth
 15827 Cap somew. umbon. smooth brown Lamel. affixed with hind end recurv. Stipes solid equal strigose
 15828 Cap obtuse smooth somewhat repand greenish-livid, Lamellæ adnate, Stipes solid smooth [short
 15829 Dirty-white, Cap become. funnel-form. smth. : marg. sinuat. and lob. Lam. adnate very tender, Stipes solid

**** Tufted, variable, some growing on wood, some on earth.

- 15830 Cap irregular rather out of centre vill. whit. Lamel. adn. compact white, Stipes solid flexu. vill. at base
 15831 Cap flat discoid viscid, Lamellæ decurrent and solid tapering, Stipes white
 15832 Cap conical powdery rufous, Lamellæ decurrent and solid ventricose powdery, Stipes rufous

- 15833 Cap whit.-brown, Stipes solid obconic, scarcely broader at top than bottom, Lamel. decurr. branch. white
 15834 Cap dead white nearly flat, Lamellæ white numerous, Stipes white with brown pith
 15835 Whitish, Cap convex, Lamellæ decurrent, Stipes solid subconical

2. Cap somewhat compact dry, Gills very distant, arcuate, decurrent.

- 15836 Cap somewhat compact streaked sooty, Lamellæ decurrent white-glaucous, Stipes long stout fibrous
 15837 Firm, Cap compact convex becoming partially expanded smooth brownish-bull with a pink tinge, Lamellæ decurrent thick, Stipes short solid attenuated below

β All white

γ Cap thinner with a striated margin

- 15838 Viscid, Cap campanul. expand. when humid striated, Lamel. adnate somew. distant, Stipes equal smooth

3. Cap thin, viscid, wet, Gills variable, Stalk hollow. TERRESTRIAL.

- 15839 Green chang. to yell. Pileus campanulate spreading, Lamellæ adnate rather distant, Stipes equal smooth
 15840 Cap nearly plane slimy substrice yellow, Lamellæ adnate decurrent distant, Stipes rather unequal gradually attenuated towards the base
 15841 Cap conical glutin. mostly yell. or crim. Lamel. crowd. ventric. attenuat. and free, Stipes substricate split.
 15842 Cap campanul. obt. lob. orange-red, Lamel. affixed ascend. yellow, Stipes thick ventricose white at base
 15843 Cap conv. expand. visc. becom. depres. Lam. adn. versicolor connect. by decurr. tooth, Stipes compr. scarlet

B. Gills unequal at the back; that is, toothed; or arcuate, decurrent, sinuate, emarginate, &c.

4. Cap dry, minutely scaly, Gills generally arcuate, decurrent, rarely adnate. FIRM.

- 15844 Gregarious, Cap scarcely fleshy tough farinaceous with minute scales pale or deep flesh-color: disk depressed in age, Lamellæ distant, Stipes long elastic

β Cap convex becoming depressed somewhat squamulose purple, Lamellæ distant thick violet-purple, Stipes purple, hollow when old

- 15845 Cap fleshy plano-convex somew. scaly brown. Lamel. arcuate affix. connect. whit. Stipes solid short firm
 15846 Cap fleshy somewhat umbonate slightly silky testaceous, Lamellæ arcuate adnate somewhat distant and solid equal, Stem sulphur-colored

- 15847 Lamellæ brown changing to purplish, Cap red-brown convex turning up with age, Stipes brownish

- 15848 Lamellæ brownish-white, Cap cinnamon bossed, Stipes brownish-white cylindrical

and Miscellaneous Particulars.

that from its leathery nature it is indigestible, except in the form of powder, in which it is admirable. Dr. Withering, however, observes, that he has seen the pileus and gills of this agaric very brittle and tender when fully saturated with moisture in rainy seasons, and in that state it is sufficiently digestive. Professor Martyn informs us that he has eaten these mushrooms for forty years without injury, and without perceiving that toughness, like leather, of which others have complained, except in very dry weather, or when they are in too advanced a state. They should be gathered young, and early in a morning, and properly dressed. They are found in hedge banks, upland pastures, and sheep commons, particularly in those patches called Fairy rings. Those that are found in woods and hedges are of inferior flavor to such as are gathered in dry pastures, which have a very pleasant smell and luscious flavor, either when stewed alone or in ragouts, &c. This sort makes excellent ketchup, and is much valued in the form of powder. It is in season during September and October, but may be dried so as to be in use for the table all the winter. Mr. Lightfoot supposes that this species is the

History, Use, Propagation, Culture,

mouccron of the French, who use it in ragouts instead of that, and acknowledge it to be equal in flavor, but more tough. The *mouccron*, however, has a very thick and fleshy pileus; its gills are very narrow and numerous, and fixed to the stem, and the stem is thick and short. Dr. Withering has carefully distinguished several other species from this fairy-ring agaric, or Scotch bonnets, as it is called by Mr. Ray.

5. *Cap smooth, somewhat humid, Gills arcuate at their connection with the edge, reticulated at their union with each other, with appendages at edge.*
 15849 Cap convex livid-purple striat. at edge, Lamel. arcu.-amix. purple with black teeth, Stipes fistular equal

6. *Cap thin, dry, Gills emarginate.* BRITTLE.

* *Cap fleshy, smooth, and stem regular.* TERRESTRIAL.

15850 Cap fleshy soft flatt. smooth, Lamel. clustered somew. ventricose white, Stipes somew. holl. long and thin

** *Cap somewhat fleshy, and stem, which has no roots, irregular.* TERRESTRIAL.

15851 Cap subcarinose irregular smooth thin fuscous, Lamellæ distant white, Stipes hollow-whitish compressed

15852 Cap fleshy deform. crack. scaly cinereous, Lamel. glued together dist. and deform. holl. Stipes cinereous

*** *Cap somewhat fleshy, and stem, which has roots, regular.* GROWING ON WOOD.

15853 Cap fleshy flat somew. streaked cinere.-whit. Lamel. very broad dist. and solid equal striat. Stipes white

C. *Gills equal, behind blunt.*

7. *Cap fleshy, glutinous, Gills somewhat united, Stem rooted.*

15854 Cap rugose glutinous tough, Lamellæ white, Stipes tall rigid with a long fusiform root

15855 More slender, Lamellæ sinuated with a decurrent tooth, Stipes very long [blackish towards base]

15856 Cap nearly plane brown orange glutin. Lamel. ventric. yellow. Stipes incurv. velvety and redd.-brown or

8. *Cap tough, dry, Gills separate, close, white.*

15857 Gregarious, Cap fleshy loose, Lamel. somew. separate serrat. Stipes hollow ventricose furrow. whit. root.
 15858 Confluent cæspitose, Cap somewhat fleshy whitish, Lamellæ loose compact, Stipes fistulous somewhat compressed red villous powdery

15859 Cap somew. fleshy campanul. expanded umbonate pallid, Lamel. loose, Stipes fistulous smooth glabrous

15860 Variable, Cap thin watery smooth plane sometimes depressed, Lamellæ free soft, Stipes hollow splitting becoming thicker towards the base pinkish or yellowish-white more colored at the summit

9. *Cap somewhat leathery, dry, Gills separate, distant, pallid.*

* *Cap fleshy, Stem solid.*

15861 Cap dry leathery convex at length plane, Lamellæ distant pale-reddish or buffish, Stipes solid clothed towards the base with a woolly or strigose mass

15862 Cap tough subumbonate reddish becoming buffish or very pale opaque, Lamellæ distant whitish, Stipes solid firm cylindrical thickest under the pileus pale

** *Cap fleshy, Stem fistulous.*

15863 Strong smell. Cap somew. fleshy smth. and lamellæ somew. loose white, Stipes fistular long downy rufous

15864 Cap somewhat fleshy wrinkled dark-purple becom. pale, Lamellæ loose rufous, Stipes fistular rubiginous

1. *Cap slightly fleshy, smooth, scarcely umbilicate, Gills true, Stem hollow, or somewhat fistulous.*

15865 Strong smell. Cap somew. fleshy, and lamellæ adnate crisp whitish, Stipes fistular short glabrous rufous

15866 Cap somewhat fleshy smooth pinkish-red, Lamellæ attached white, Stipes nearly solid short scaly

15867 Cap somew. fleshy obt. clay-colored, Lamellæ attached lax white, Stipes fistular rooting smooth yellow.

15868 Cap plane or somewhat umbonate, Lamellæ adnate numerous, Stipes subfistulose slightly tomentose at the base and springing from a reddish tuberous root

15869 Cap membranous papillose grey, Lamellæ white, Stipes racemose

15870 Cap plano-convex reddish-orange, Lamellæ white rather broad fixed, Stipes very slender subsolid whitish

15871 Gregarious, Cap nearly plane white sometimes changing to reddish, Lamellæ adnate white, Stipes short minutely furfuraceous marked within with a white line

15872 Cap somewhat fleshy convex becoming flat pruinose pale-grey, Lamellæ attached thick distant more obscure, Stipes fistular villous

2. *Cap thin, membranous, flat, becoming depressed, plaited, rugose, Gills veiny, of the same substance as the cap, Stem horny, black.*

15873 Cap flat plaited, and lamellæ (which are very broad adnate and distant) white, Stipes solid smooth brownish thicker and paler towards the extremity

15874 Cap conv. umbilic. plicate, Lam. attach. to a collar surround. stipes white, Stipes holl. striate black below

15875 Cap convex plicate white sometimes tinged with brown, Lamellæ simple adnate white, Stipes hollow furrowed very glabrous purplish-brown or black except at the summit

15876 Cap convex umbilicate plicate redd.-brown, Lamel. adnate pale-yellow. Stipes holl. redd.-brown velvety

15877 Cap flatt. rugul. pall. Lam. adnate simp. many being halved, Stipes smth. fistular velvety blackish-brown

15878 Cap nearly plane rugose, Lamellæ few adnate resembling white prominent veins, Stipes hollow very minutely velvety reddish-brown below

15879 Cap convex-expanded whitish and rufous, Stipes covered with straight red hairs, Lamellæ whitish

and Miscellaneous Particulars.

§ 9. *Collybia*. So called from *κόλλυβος*, a kind of small money. Small and persistent, gregarious species, growing either on earth or wood. Some of the species may be used as food.

History, Use, Propagation, Culture,

§ 10. *Mycena*. From *μυκός*, a kind of small fungus. The species are of the smaller kind, at least they are thin and slender, and tolerably permanent. None of them are fit for food; many are distinguishable by their smell, which is always powerful.

1. *Dry, Cap generally umbonate, not depressed, Gills separate or adnate, not decurrent.*

* *Stem rooting, smooth, juiceless, Gills separate, whole-colored.*

- 15880 Cap becoming nearly plane subcoriaceous, Lamellæ free whitish, Stipes tall covered with a sort of bloom dark purplish-brown below velvety at the base
 15881 Cap smooth blackish, Margin and lamellæ loose whitish, Stipes tumid at base, strigose
 ** *Stem smooth, juiceless, somewhat rooting, Gills adnate, whole-colored.*
 15882 Cap obtuse striated cinereous, Lamellæ adnate glaucous white, Stipes smooth firm villous at base
 15883 Cap brown. Lamel. whit. adnate with a decurrent process, Stipes smth. tenacious strig. at base and radicat.

*** *Stem juiceless, striated, Gills whole-colored.*

- 15884 Cap obscurely striate blue-grey, Lamel. attenuated and subadnate whit. Stipes long rigid striate glisten.
 **** *Stem smooth, milky, somewhat rooting, Gills attenuated, united at the edge.*
 15885 Cap striated blackish glaucous, Lamellæ affixed white, Stipes filled with white juice
 15886 Cap fleshy-membranous whitish-red, Lamellæ affixed, and stipes filled with dark-red juice
 15887 Cap striated reddish-brown, Lamellæ adnate whole-colored at the edge, Stipes filled with red juice

***** *Stem smooth, juiceless, somewhat rooting, Gills adnate, discolored at edge.*

- 15888 Cap striated livid-yellow, Lamellæ adnate linear livid : margin yellow, Stipes rigid smooth fibrous at base
 15889 Bright-red, Cap acutely umbonate with a striate margin, Lamellæ fixed dilute reddish, Stipes firm strigose and pale at the base
 15890 Cap between fleshy and membranaceous convex pale rose-purple, Lamellæ ventricose rather paler than pileus, Stipes smooth villous at the base
 ***** *Stem smooth, juiceless, scarcely rooting, Gills affixed, whole-colored. COLOR PURE.*

- 15891 Cap between fleshy and membranous obtuse somewhat rose-colored, Lamellæ round ventricose pallid, Stipes smooth villous at base
 15892 Cap obtuse smooth, Lamellæ adnate white, Stipes smooth rootless
 15893 Cap umbonate striated and slender, Stipes yellow, Lamellæ adnate white
 15894 Cap somew. umbonate striated yellowish-white, Lamel. affixed distinct, and stipes rigid smoothish white

***** *Stem juiceless, rootless, but swollen at base into a globe, Cap blunt.*

- 15895 Pale-brown, Cap conical smooth, Lamellæ loose compact, Stipes thickish hairy

2. *Cap or stem viscid, Gills adnate or decurrent.*

- 15896 Cap obtuse striated and elongated, Stipes yellow viscid, Lamellæ uncinat
 15897 Cap umbonate becoming depressed striated cinereous, Lamellæ decurrent white, Stipes short firm viscid

3. *Dry, Cap finally depressed, Gills decurrent.*

* *Firm, persistent, with a firm stem.*

- 15898 Cap somewhat membranous campanulate striated at edge, Lamellæ decurr. very broad, Stipes solid thin
 ** *Delicate, withering, with a capillary stem.*
 15899 Cap thin hemispher. becom. umbilicat. and striat. Lamel. uncin. decurr. dist. Stipes short incurv. smooth
 15900 Thin rosy, Cap campanulate smooth, Lamellæ broad distant, Stipes capillary with a strigose bulb

- 15901 Slender, Stipes slender with stiff wool at base, Cap depressed hemispherical

1. *Cap somewhat membranous, Gills decurrent.*

* *Small, Cap membranous.*

- 15902 White, Cap convex smooth, Lamellæ distant, Stipes attached to the base of a convex radiat. membrane
 15903 Cap convex glabrous orange-yellow, Lamellæ whitish distant, Stipes yellowish
 15904 Testaceous rufous pallid, Cap funnel-shaped : disk smooth, Lamellæ narrow, Stipes firm
 15905 Cap convex umbilicat striate, Lamellæ broad pale, Stipes solid short thickish [at the base
 15906 Cap depress. in centre : marg. turned down striate, Lamel. dist. rather broad white, Stipes short pubesc.
 15907 Stipes solid thickened at base ferruginous downy

** *Large, Cap somewhat membranous.*

- 15908 Tender cinereous blackish, Cap funnel-shaped striated, Lamel. lin. Stipes somew. solid tough vill. at base
 15909 Thin pale cinereous, Cap somewhat funnel-shaped smooth oblique, Stipes thick

2. *Cap fleshy, membranous, Gills adnate.*

- 15910 Odor. Cap nearly plane pale yellow. or brown-white when dry, Lamel. numer. whit. Stipes holl. white
 15911 Livid, Cap somewhat membranous plane striated, Lamellæ distant, Stipes fistular [attenuat. above
 15912 Cap somew. fleshy funn.-shap. smooth dark-brown grey : marg. reflexed, Lamel. dist. grey. Stipes elastic

- 15913 Cap thin campanulate green at centre brown and plaited at margin, Stipes smooth hollow

3. *Cap fleshy, coriaceous, somewhat corky, soft, Gills decurrent.*

- 15914 Cap regular umbilicat. whitish with black. hairy scales, Lamel. denticul. white, Stipes thin minutely scaly

and Miscellaneous Particulars.

¶ 11. *Omphalia*. From *oμλν*, the navel, in reference to the young form of the pilius. Many of the species are of the smallest size. None are eatable.

History, Use, Propagation, Culture,

§ 12. *Pleurotus*. From *πλευρον*, the side; the pileus is always inserted out of the centre. A tribe of perennial, innocuous, often eatable fungi; always found upon trees.

§ 13. *Mouccron*. An old French name of certain eatable fungi. This, no doubt, is the origin of our word Mushroom. *A. prunulus* is said to be one of the very best of mushrooms; it is common in woods, among grass.

§ 14. *Clitopilus*. A name analogous to *Clitocybe*, § 8, as the group is also. Species of the middle size, nearly destitute of smell, mild, but not used as food.

- 15915 Cap compact unequal pale ochraceous, Scales spot-like more opaque, Lamellæ torn, Stipes stout scaly
 3 Stipes long curved, Cap small
- 15916 Cap tough somewhat lobed twisted smooth rufous, Lamellæ toothed pallid, Stipes firm furrowed rufous
 1. *Veil universal, Cap compact, horizontal.*
- 15917 Hard, Cap oblique smoothish whitish, Scales brownish, Veil fugacious
 2. *Veil none, Cap fleshy, Gills decurrent.*
 * *Cap always entire.*
- 15918 Cap tough depressed reddish tan-color, Lamellæ rather crisp paler, Stipes short grey downy
 ** *Cap entire or halved.*
- 15919 Cap tough deformed pink cinnamon-color, Lamel. entire and short irregul. Stipes downy at base and pallid
- 15920 Tufted, Stipes sublateral or none, Cap smooth fleshy pale blueish-grey or brown, Lamellæ whitish often anastomosing at the base
 *** *Cap always halved, somewhat ascending.*
- 15921 Ascending, Cap spatulate whitish-brown, Disk and stipes somewhat villous, Lamel. compact lin. white
- 15922 White, Cap ascending sessile ear-like glabrous, Lamellæ narrow linear quite entire
- 15923 Cap flattish smooth pale-brown, Margin and lamellæ crenate, Stipes short or none
 3. *Veil none, Cap fleshy, when young horizontal, Gills terminating in a determinate manner.*
- 15924 Cap compact smooth pale whitish, Lamellæ adnate or subdecurrent whitish, Stipes strong ascending increased at the base excentric
- 15925 Cap smooth rufous, Lamellæ adnate of the same color, Stipes out of the centre smooth whiter
- 15926 Cap comp. somew. visc. olive-green, Lamel. adnate comp. pallid, Stipes short rather on one side sooty scaly
- 15927 Cap coriaceous reniform rather tan-colored, Epidermis separating into scurfy scales, Lamellæ veinly connected, Stipes lateral frosted
4. *Cap fleshy, when young resupinate, Gills running together in a point out of the centre.*
- 15928 Cap fleshy reniform downy yellowish, Lamellæ orange-yellow
- 15929 Cap fleshy scaly mouse-color, Upper stratum gelatinous, Lamellæ greyish-white
- 15930 Cap soft smooth gibbous pale-yellow brown, Lamellæ pale reddish-brown somew. ventricose, Stipes none
- 15931 Cap membranaceous white cottony at first subresupin. at length reflexed, Lamel. whit. afterw. pink.-buff
- 15932 Cap fleshy smooth umber-colored: the upper layer gelatinous, Lamellæ pale becoming yellow
 5. *Cap membranous, Gills adnate, or running together in one point.*
- 15933 Cap reniform diaphanous, Lamellæ linear, Stipes marginal ascending villous [like Byssus]
- 15934 Cap at first resupinate: afterw. reflex. smooth downy, Lamel. radiat. Stipes thin incurved downy, floots
- 15935 Cap subsessile: at first resupinate; afterwards reflexed frosted villous at base, Lamellæ lax
- 15936 Cap compact flattish white, Lamellæ white becoming pink
 1. *Gills affixed. TERRESTRIAL.*

- 15937 Cap somewhat umbonate sooty black, Lamel. flat decurr. twist. whit. Stipes hollow thickened downwards
- 15938 Cap somewhat umbonate silky livid, Lamellæ adnate whitish rose-colored, Stipes hollow smooth white
- 15939 Cap somew. umbon. smooth livid pale, Lamel. annexed flesh-colored, Stipes solid smooth somew. bulbous
- 15940 Broad, Cap smooth yellowish-white, Lamellæ loosely attached very broad rufous, Stipes solid equal white
- 15941 Small, Cap convex and stipes white, Lamellæ adnate
 2. *Gills altogether distinct. UPON WOOD.*
- 15942 Cap somewhat membranaceous smooth yellow, Stipes solid striated
- 15243 Cap fleshy smooth blackish soot-color, Stipes firm with black fibres
- 15944 Cap convex at length plane clear olive or yellowish-brown smooth but minutely rug. as if veined towards the centre, Stipes hollow rather twisted, Lamellæ ventricose
- 15945 Cap scaly grey-lilac colored, Lamellæ loose, Stipes hollow fibrous caesious
- 15946 Cap somewhat squamose blue, Lamellæ bluish-white adnate at length purple, Stipes solid smooth bluish
- 15947 Cap irregular smooth somew. cinnamon-colored, Lamel. loose toothed rosy, Stipes hollow twisted striated
- 15948 Cap campanul. expanded black. soot-color when dry paler and silky, Lamel. almost loose dirty flesh-col.
- 15949 Cap fibrous scaly livid-grey, Lamel. adnate and fistular, Stipes (which is white with wool at the base) paler
- 15950 Cap squamulose umber-colored, Lamellæ sinuate affixed purplish, Stipes solid short
- 15951 Cap smooth with a striated edge and the fistular equal, Stipes livid, Lamellæ decurrent
- 15952 Lamellæ salmon-colored not numerous, Cap and stem white

and Miscellaneous Particulars

- § 15. *Leptonia*. From λεπτος, slender. Small permanent, elegant, scentless, insipid, not used for food. They are in perfection at the end of summer.
- § 16. *Notanea*. From nota, a bell. Terrestrial, various, of a thin watery substance, insipid, not eatable. Easily distinguished by their habit.
- § 17. *Eccilia*. From εκκοιλω, to excavate. Small, terrestrial, inodorous, insipid.

History, Use, Propagation, Culture,

§ 18. *Telamonia*. So named on account of their gigantic stature. The species are among Agarics what Ajax Telamonius was among men. Large, terrestrial, firm species, none of which are eaten. The species of this and the next subgenus are extremely difficult to determine; not only on account of their size, but of their colors, which vary exceedingly at different periods of their growth, as well as according to their situation. Their colors are also intermediate between fulvous, testaceous, cinnamon, &c., which are very difficult to describe. The most constant marks are, first, smell; second, surface of pileus being fibrous or viscid; third, the situation of the lamellæ, whether they are compact or distant; and fourth, their color in the young state, in which it must be observed, that they are always described.

The *A. bulbosus* of Hudson and Ray is referred by Withering to *A. violaceus* of Linnæus; which has fixed purple gills, numerous, eight in a set; long gills, sometimes cloven, and a few of them decurrent; purple pileus, soft, smooth, firm, convex, but centrally depressed with age, and cracking at the edge, which is somewhat turned down, from half an inch to five inches over: stem solid, cylindrical, purple, bulbous at the base, from one to four inches high, and from a quarter to one inch in diameter; and curtain like a cobweb. In maturity it plentifully emits a powder of the color of Spanish snuff. It is not uncommon from October to December, in Edgbaston and Barr plantations, in the woods near Bath, and at Powick, near Worcester. With much broiling and duly seasoned, it is esteemed as delicious as an oyster. Another variety, which is the *A. varius* of Bolton, is found on grass-plats and new-mown fields in July. It has chocolate gills, from brown to black,

- 15953 Cap obt. fibrous hoary testac. Lamellæ adn. purple. An annulus sheath. stipes which is violet at upp. end
 15954 Cap bluntly umbon. somew. fibr. pale umb.-color, Lamel. adnate umb.-col. Stipes somew. bulb. striat. paler
 15955 Cap somew. fleshy purp.-brown becom. fibrous testac. and hoary, Lamel. violet-pur. Stipes long eq. violet
 15956 Cap scaly testaceous olive-color, Lamellæ yellowish cinnamon, Stipes bulbous scaly, Veil fuscous
 15957 Cap obtusely umbon. smth. bright-brown when dry testac. Lamel. cinnamon. Long bulb. stipes and veil white

1. Cap always dry, scaly, or fibrous, obtuse or umbonate, never depressed.

- 15958 Cap very convex dull or brownish-violet, Lamellæ distant violet, Stipes spongy greyish violet within
 15959 Cap umbonate squarrose with hairy sooty scales, Lamellæ compact violet becoming clay-colored, Stipes scaly transversely banded with black

- 15960 Cap umbon. smooth. pale-brown, Lamel. compact violet discolor. Stipes taper. varieg. with brown scales

2. Cap smooth, humid, viscid, always obtuse, finally depressed, Stem blue, becoming white.

- 15961 Cap equal viscid, Lamellæ compact olive-purple, Stipes attenuated bulbous
 15962 Cap equal viscid smooth, Lamellæ compact violet-purple, Stipes bulbous becoming white from violet
 15963 Compact rounded, Cap olivaceous or brownish-grey glutinous white young, Lamellæ reddish-brown tinged with violet, Stipes thick tinged with violet

- 15964 Firm, Cap yellow somew. scaly humid viscid, Lamel. compact serrat. whit.-caesious, Stipes tapering white

- 15965 Cap smooth viscid yellow or tawny, Lamellæ compact quite entire yellowish-cinnamon, Stipes bulb. white

1. Cap scaly or fibrous, Stem same color as the cap or paler. GROWING ON THE EARTH.

* Cap fleshy, at first convex.

- 15966 Cap slightly fleshy somew. scaly, and stipes (which is thin and eq.) dull sang. Lamel. affix. more dull-color.
 15967 Cap glabrous subcarneous obtusely umbonate cinnamon-color, Lamellæ numerous adnate yellow-cinnamon, Stipes yellowish rarely straight

- 15968 Cap pale reddish-buff umbonate subfarinaceous, Lamellæ cinnamon-color broad numerous, Stipes whitish often with a few remains of the veil attached

** Cap somewhat fleshy, at first campanulate.

- 15969 Cap somew. fleshy becom. umbon. smoothish brown-purple, Lamel. affix ventric. ferrugin. Stipes fuscous

2. Cap smooth, but with a few surface-fibres, Stem white. GROWING ON THE EARTH.

- 15970 Cap bluntly umbonate pallid, Lamellæ compact cinnamon-colored, Stipes solid tapering upwards white

- 15971 Cap somewhat fleshy convex becoming bluntly umbonate chesnut-colored, Lamellæ affixed compact violet-testaceous, Stipes short firm

3. Cap smooth, dry, Gills affixed

- 15972 Cap convex humid orange-colored or fulvous, Lamellæ yellow, Stipes hollowish

- 15973 Lamellæ brown-yellow, Cap deep-yellow bossed in the centre, Stipes scored yellow thickset downwards

- 15974 Lamellæ reddish-buff, Cap pale-yellow bossed, Stipes pale-yellow

- 15975 Fulvous, Cap fleshy: scales few hairy, Lamellæ annexed, Stipes solid smooth, Annulus small

- 15976 Cap pitted lemon-colored: hairs white; disk uniform with scatter scales towards disk, Stipes solid white

- 15977 Compact, Cap yellow: scales scattered appressed, Stipes solid fulvous long-rooted

- 15978 Cap fleshy brownish or reddish-yellow scaly with fasciulat. filam.: scales revol. Stipes squarr. with scales

- 15979 Cap fleshy dry yellow: scales hairy scattered, Lamellæ at first yellow, Stipes equal squarrose

- 15980 Cap slightly fleshy obt. fulvous-yellow vill. with stalked scales, Lamel. adnate: at first yell. Stipes fistul.

- 15981 Cap scarcely fleshed glabrous striate: when moist dull cinnamon-color becoming pale, Lamellæ subcurrent numerous reddish-brown, Stipes hollow subincurved

- 15982 Cap yellow-brown bluntly conical, Lamellæ brown, Stipes brown scurfy, Veil permanent

and Miscellaneous Particulars.

mottled, and in pairs; pileus mouse-color, conical, and pointed; stem of the same color, cylindrical, and firm. This, though a common, is a very beautiful species. In a summer morning it is covered with a bloom like that of a plumb, having often a glittering spangled appearance; its form is regular, and the fringe of the curtain peculiarly delicate. Another variety, with the stem of a dark mulberry color, is found in wet gravel where no grass grows, and sometimes on cow-dung, in which case the stem, under the shelter of long grass, is covered with a white hoariness which is easily rubbed off.

§ 19. *Inoloma*. A name with the same meaning as *Tricholoma*, § 5., to which the species are analogous. They are large, firm, somewhat succulent, autumnal, and terrestrial, but not as far as is known, edible.

§ 20. *Dermocybe*. From *derma*, a skin or membrane, and *cybe*, a head, in allusion to the nature of the pileus. Analogous to *Clitocybe*, § 8. Of middle size, or small; scarcely eatable. A cinnamonous has gills, four in a set, broad about the middle, deep tawny red, and fixed by claws; pileus convex, but bossed, of a rich cinnamon color, from one and a half to three and a half inches diameter; the stem hollow, cylindrical, silky, shining, two inches high, thick as a goose-quill, of a fine full yellow color. This is a species that is readily distinguished by its cinnamon color. It is found in woods in September and October, and has a good flavor.

§ 21. *Pholiota*. From *φολία*, a scale. Species of various habits. Some are terrestrial, others grow upon wood; some large, others of a smaller size.

History, Use, Propagation, Culture,

§ 22. *Myxaciium*. So called from $\mu\upsilon\zeta\alpha$, mucus, on account of the nature of its surface. The species are large, solitary, terrestrial, mucous, inodorous, and not eatable.

§ 23. *Hebeloma*. From $\eta\beta\eta$, down, and $\lambda\omega\mu\alpha$, a margin. The only species has a nauseous taste. Its lamellæ are serrated, and distil drops of a peculiar fluid. Its varieties are infinite. Common in woods.

§ 24. *Flammula*. So named in allusion to their color, which is a pale yellow, the color of a weak flame. The species are gregarious, subcæspitose, firm, persistent, rather bitter, and all eatable. A. socialis and ilicinus are both eaten at Montpellier, where they are known by the names of *Pivoulade d'couse* and *Frigoule*.

§ 25. *Inocybe*. From $\iota\alpha$, fibres, and $\nu\upsilon\beta\eta$, a head. A tribe which can scarcely be compared to any other. It consists of fungi of middle-size, or smaller, solitary, growing on the ground during the summer, and not known to be poisonous; although, on account of their nauseous odor, they are suspicious.

§ 26. *Naucoria*. Small gregarious epiphytous fungi, growing upon stipules, leaves, wood, and even muddy earth, fragile, and without any smell. Their stature is that of *Collybia*, but their veil is of the same nature as that of *Lepiota*, resembling the kernel of a nut (*naucium*), whence they are named.

15983 Cap fleshy smth. orange-brown, Lamel. pur. : then ferrugin. Stipes part. across into bluish gelatin. scales
 15984 Cap somewhat fleshy smooth, Lamellæ cinnamon-colored, Stipes long smoothish

15985 Cap somewhat repand opaque, Stipes scaly white, Sporidia clay-color

1. *Cap dry, Gills adnate, Tufted.* GROWING ON WOOD.

15986 Cap smooth yellowish, Lamellæ adnate yellow-ferruginous, Stipes fibrous

15987 Cap smooth yellowish, Lamellæ affixed yellow, Stipes fibrous pallid solid

2. *Cap viscid, Gills adnate, Not tufted.* GROWING UPON BOTH WOOD AND EARTH.

15988 Yellowish, Cap smooth viscid, Lamellæ adnate, Stipes hollow tapering at base

1. *Stem fibrous or scaly with fibres.*

15989 Cap fleshy obtuse scaly brownish-grey, Lamellæ free or nearly so, Stipes solid fibrillose

15990 Cap somew. fleshy hemispherical mouse-color, Stipes solid thin long scaly squarr. Lamel. somewhat loose

15991 Cap somewhat fleshy convex scaly-villous, Lamellæ loose and solid : then fibrous, Stipes solid

2. *Stem nearly at the top with white scales.*

15992 Cap dry campanulate at length nearly plane : surface splitting longitudinally pale shining-brown, Stipes solid somewhat tuberosus at the base

15993 Cap conical at length expanded umbonate silky, Lamellæ subadnate, Stipes solid slender sprinkled with white pulverulent particles

15994 Cap yellow-brown scaly, Gills watery white irregular, Stem yellow-brown crooked scored

15995 Cap somew. fleshy scurfy scaly rufous cinnamon-color. Lamel. emarg. lin. cinnam.-color. Stipes scaly at end

15996 Cap somew. fleshy : then umbilicate, scaly or silky, Lamel. somew. decurr. cinnam.-color. Stipes fistul. scurfy

15997 Cap dark-brown convex, Lamellæ light-brown, Stipes light-brown

15998 Cap somewhat membranous smooth pallid, Lamel. somewhat loose saffron-color. Stipes long villous white

15999 Cap obtusely conical stri. when moist : when dry smth. ochrac. Lamel. adnate lin. Stipes long glab. fragile

16000 Minute, Cap campanulate striate : when moist reddish-buff becoming pale, Lamellæ adnate rather broad distant, Stipes somewhat crooked filiform

16001 Cap somewhat conical : when dry elastic, Lamellæ few trifid, Stipes very long and slender

16002 Cap globose chestnut-color lobed and incurved at edge, Lamel. trifid wavy, Stipes slender white fistulous

16003 Compact, Cap depressed ochrey-brown with a tomentose involute margin, Lamellæ mostly dichotomous, Stipes thick often excentrical

16004 Cap convex scaly cracked and irregular, Lamellæ orange-brown, Stipes stout somewhat lateral

16005 Cap conv. viscid becom. wrinkled dull-brown : marg. invol. Lamel. adnate yellow. Stipes hard thick black

16006 Imbricated sessile vilvous, Cap fleshy obovate scaly towards the margin

16007 Cap subsessile smooth flaccid pale, Lamellæ watery cinnamon-colored

16008 Cap reniform villous pale tan-color, Lamellæ rounded ferruginous, Stipes lateral tapering upwards white

16009 Cap membranous reflexed silky downy white, Lamellæ whitish

16010 Cap silky white, Lamellæ flesh-colored, Stipes solid tapering incurved, Volva lax

16011 Cap campanulate with scattered scales, Stipes hollow ventricose smooth below

16012 White, Cap dry smoothish, Lamellæ loose broadest in front, Stipes hollow smooth, Annulus ascending

16013 Cap white fleshy dry subquamoso or sericeous, Lamellæ free ventricose pink changing to dark-fuscous Stipes solid white with an annular veil

and Miscellaneous Particulars.

¶ 27. *Galera*. From *galea*, a helmet, in reference to the figure of their pileus. The species are slender, fragile, tolerably permanent, mostly growing on the ground, and for the most part choosing humid stations. They have neither smell nor use.

¶ 28. *Tapinea*. Fungi of various natures, deriving their name from *ταπεινω*, to depress. Mostly terrestrial and permanent, but scarcely fit for food

¶ 29. *Crepidotus*. These plants form a transition to *Pratella*. They grow on wood or trees, and are hardly eatable. *A. olivarius*, a species which grows upon olives in the south of Europe, a poisonous species, exhibits a phosphoric appearance in the night. *A. translucens*, a French species, is eaten by the poor of Montpellier.

¶ 30. *Volvaria*. So called from the magnitude of their *volva*. The species grow in fertile manured spots, or on wood, are soft and soon perishable. The larger are fit for food

¶ 31. *Psalliota*. Mostly eatable. Named from *ψαλλω*, a chain-bit, in the same sense as *Armillaria*. To this place belongs the common Mushroom, *A. campestris*, so called from *Moucceron*, the French name of another eatable kind. It is found all over Europe, the north of Asia, and of Africa, and in North America

History, Use, Propagation, Culture,

Of all the species of agaric, one only has been selected for cultivation in our gardens, viz. the *A. campestris*, or common mushroom, or champignon. The gills of this species are loose, pinky red, changing to a liver-color, in contact with the stem, but not united to it; very thick set, irregularly disposed, some forked next the stem, some next the edge of the pileus, some at both ends, and in that case generally excluding the intermediate smaller gills. The pileus is white, changing to brown when old, and becoming scurvy; regularly convex, fleshy, flatter with age, from two to four inches, and sometimes nine inches in diameter, and liquefying in decay; the flesh white. The stem is solid, white, cylindrical, from two to three inches high, half an inch in diameter; the curtain white, and delicate. When this mushroom first makes its appearance, it is smooth and almost globular; and in this state it is called a button. This species is esteemed the best and most savoury of the genus, and is much in request for the table in England. It is eaten fresh, either stewed or boiled, and preserved either as a pickle, or in powder; and it furnishes the sauce called ketchup. The field plants are better for eating than those raised on artificial beds, their flesh being more tender; and those who are accustomed to them can distinguish them by their smell. But the cultivated ones are more sightly, may be more easily collected in the proper state for eating, and are firmer and better for pickling. The wild mushrooms are found in parks and other pastures, where the turf has not been ploughed up for many years; and the best time for gathering them is August and September. Dr. Withering mentions four varieties.

The *A. Georgii* of Linnæus resembles the former, but is much inferior to it in flavor. Its gills are yellowish white; the pileus yellow, convex, hollow in the centre; the stem yellow, thickish, and smooth; the juice yellow, which flows plentifully from it when wounded. It is gathered in September in woods and pastures. A variety of this is found on the sea-coast of Cornwall, of a large size, with the button as big as a potatoe;

- 16014 Cap very fleshy convex white or pale-yellowish mostly smooth, Lamellæ broad whitish at length deep purple-brown, Stipes thick with a persistent collar
- 16015 Cap fleshy smooth yellowish tan-color, Lamellæ annexed with a decurrent tooth pale-brown, Stipes nearly solid smooth white
- 16016 Cap hemispher. smooth glutin.redd..yell. Lamel. adnate mostly horizont. darkly mott. Stipes holl. squam. hollow fibrillose thickest at the base
- 16017 Cap somewhat viscid yellow: scales scattered concentrical, Lamellæ adnate blackish, Stipes solid
- 16018 Cap scaly greenish-brown, Lamellæ decurrent becoming rufous-brown, Stipes solid bulbous [squamose
- 16019 Cap fleshy yell. but being cover. with a blue slime appear. green. Lamel. adnate purple-brown, Stipes holl.
- 16020 Stipes solid white, Annulus persistent, Cap yellow-brown, Lamellæ adnate reddish-grey
- 16021 Cap fleshy very fibrous pale yellow-brown, Lamellæ dull reddish-brown exuding a thin grey fluid, Stipes hollow fibrillose thickest at the base
- 16022 Cap fleshy obt. brown-orange, Lamel. slightly green. Stipes filled with a spongy mass stained by the veil
- 16023 Cap somew. fleshy umbon. ochrace. or redd.-orange, Lamel. green. numer. Stipes holl. rather long slender
- 16024 Cap convex viscid, Lamellæ adnate whitish-brown, Stipes long fibrous
- 16025 Cap obtuse smooth viscid livid-yellow, Lamellæ broad decurrent brown, Stipes long naked
- 16026 Cap convex smooth shining, Lamellæ broad adnate blackish, Stipes long naked
- 16027 Cap light-brown semiglobular, Lamellæ purplish-brown broad thin, Stipes reddish-brown
- 16028 Cap conical dry, Lamellæ adnate ascending dark-purple, Stipes tough smooth pale
- 16029 Cap somew. fleshy smooth fuscous-brown pallid, Lamel. adnate numer. brown. flesh-color. Stipes smooth
- 16030 Cap somewhat membranous campanulate obtuse, Lamellæ very broad at back adnate cinereous-blackish: margin pink, Stipes thin smooth
- 16031 Cap cinnamon-color conical, Lamellæ dusky-brown, Stipes brownish cylindrical smooth
- 16032 Cap somewhat fleshy obtusely campanulate glutinous yellowish or brownish-white, Lamellæ adnate greyish-black, Stipes long white, Veil annular entire
- 16033 Cap somewhat fleshy campanulate humid cinereous pallid, Lamellæ adnate cinereous-black whole-colored at edge, Stipes long rufous, Annulus ragged
- 16034 Cap somewhat fleshy campanulate dry blackish soot-colored pallid, Lamellæ adnate cinereous-dark white at edge, Stipes long rufous striated at end
- 16035 Cap convex somewhat umbonate viscid yellow, Lamellæ annexed pallid, Stipes attenuated smooth yellow
- 16036 Cap membranaceous plicate viscous yellow, Lamellæ scarcely attached to the stipes pale purplish at length brown flesh-color, Stipes equal shining
- 16037 Cap hemispherical smoothish whitish, Lamellæ loose blackish-purple, Stipes naked white
- 16038 Gregarious small, Cap ovato-campan. plicate, Lamel. subadnate whit. at length grey, Stipes incurv. glab.
- 16039 Cap somewhat fleshy white scaly, Lamellæ white changing to red-purple and to black, Stipes sub-bulbous, Veil annular moveable
- 16040 Cap membranous white separating into broad scales, Lamellæ blackish, Stipes bulbous naked
- 16041 Tufted, Cap somewhat fleshy grey becoming reddish-brown smooth scaly at the apex, Lamel. ventricose white changing to purplish-brown, Stipes equal naked

and Miscellaneous Particulars.

the expanded pileus eighteen inches over, the stem as thick as a man's wrist, the gills very pale, the curtain tough, and thick as leather, and the juice yellowish. A plant of this kind, as Dr. Withering informs us, was gathered on an old hot-bed in a garden in Birmingham, which weighed fourteen pounds.

Greville says, "A. Georgii derives its name, according to Parkinson, from springing up about the time of St. George's day. It is unquestionably the largest of the British agarics. It has been known to weigh fourteen pounds. Mr. Hopkirk mentions one that weighed five pounds six ounces, and measured forty-three inches in circumference; but Mr. Stackhouse found it to attain the enormous size of eighteen inches in diameter, which is fifty-four in circumference, having a stem as thick as a man's wrist. The best distinguishing marks are, the extreme paleness of the lamellæ at the period of the bursting of the veil, compared with the true mushroom; the greater convexity and thickness of flesh at the same period; and shortly afterwards, the more yellowish and tough pileus."

- § 32. *Hypoholoma*. So called, from $\lambda\upsilon\sigma\alpha\varsigma$, a cup, and $\lambda\omicron\mu\omicron\alpha$, an edge. Wood species growing in patches.
- § 33. *Psilocybe*. From $\psi\iota\lambda\omicron\varsigma$, thin, and $\kappa\omicron\sigma\mu\omicron$, a head. A very natural assemblage. The species are for the most part terrestrial, inhabiting fertile and somewhat fenny places, growing either solitary or in groups, not eatable, and subject to much variety of appearance.
- § 34. *Psathyra*. So called, from $\psi\alpha\theta\upsilon\varsigma$, fragile, on account of their remarkable brittleness. Many species are found upon moist wood, and in grassy places on a fertile soil.
- § 35. *Coprinus*. All the species are found on dung, whence their name, from $\kappa\omicron\pi\tau\iota\alpha$, dung.
- § 36. *Coprinus*. Named for the same reason as the last. The species are gregarious and fugacious. They are found on dung-hills, rich grassy places, and in the hollow trunks of decayed trees. The taste of the

History, Use, Propagation, Culture,

European species is watery and nauseous; they are therefore not eatable. But in the spice islands, two species *C. moschocaryanus*, which is found on the nutmegs, and *C. saguarius*, which inhabits the pith of the Sago palm, are said to be most delicious. *C. cinereus* is extremely rapid in its growth, attaining perfection and dissolving in the course of a few hours. At its first appearance, it is covered with the delicate frosted remains of the veil.

2367. *Gomphus*. So named from their form, from γομφορ, a club. Large Fungi, scarcely fit for food, with little taste or smell.

2368. *Cantharellus*. An alteration of the French *Chantarelle*. *C. cibarius* is one of the best of our eatable mushrooms. The best way of preserving the plants for use is to string them in rows, after they have become flaccid, and to hang them in a dry place where they can have plenty of air. They then form a delicious ingredient in rich gravies, &c.

2369. *Merulius*. A name applied by the ancients to the common morel, *Morehella esculenta*. Natives of rotten wood, which they soften and finally destroy. *M. lacrymans*, the dry rot, is a pest to the wood of dwelling houses, which it speedily destroys. It is said to be destroyed by a wash of diluted sulphuric acid. The whole plant is generally resupinate, soft, tender, at first very light, cottony and white. When the veins appear, they are of a fine yellow, orange, or reddish-brown, forming irregular plicæ, most frequently so arranged as to have the appearance of pores, but never any thing like tubes. Sometimes the pileus or substance of the plant, from its situation, produces pendent processes like inverted cones. "The whole fructification often forms a circle of 1—8 inches in diameter." Except in favorable situations, it does not produce fructification, and resembles a dry pithy cottony substance, whence it has been called the dry rot. When in a perfect state, its sinuses contain drops of clear water, which have given rise to the specific name.

2370. *Schizophyllum*. From σχίζω, to cut, and φύλλον, a leaf, in allusion to its lacerated appearance. Found

- 16042 Tuft. Cap membranac. furrow. furfurac. brown-orange, Lamel. pale chang. to black, Stipes equal fragile
 16043 Cap campan. farin. with min. scales, Stipes snow-white tomentose, Lamel. narrow at length brown.-black
 16044 Cap furrowed subtomentose cinereous smooth on the summit, Lamel. lin. Stipes tall attenuated upwards
 16045 Cap obtuse scaly scurfy wavy-furrowed sooty, Lamellæ numerous linear blackish, Stipes somewhat silky
 16046 Very tender, Cap. conical at length plane umbilicated plicate, Lamellæ not reaching to the stipes distant dark-grey, Stipes smooth weak
 16047 Ovale-campanulate scaly while young afterwards glabrous becoming expanded and revolute grey or tinged with brown very thin splitting, Lamellæ distant.
 16048 Very delicate and fugacious, Cap grey furfuraceous at length splitting in a radiated manner glabrous brownish in the centre, Stipes filiform

- 16049 Cap obtuse glutinous purplish-brown., Lamellæ whitish cinereous
 16050 Cap umbonate somewhat viscid rufous-brown, Lamellæ purple umber-colored

- 16051 Cap slightly fleshy umbonate cinereous-blackish, Stipes solid paler, Plaits straight white
 16052 Cap fleshy rather depressed downy and solid, Stipes orange-yellow, Plaits straight orange-colored
 16053 Rich buff yellow, Cap fleshy irregular smooth: veins tumid, Stipes solid attenuated at the base
 16054 Cap funnel-shaped pervious scaly and hollow, Stipes blackish, Plaits distant cinereous
 16055 Cap tubeform pervious scaly black umber-color: wrinkles obsolete

- 16056 Cap coriaceous membranous depressed wavy pallid rugose beneath, Stipes solid
 16057 Horizontal sessile lobed membranaceous dilute brown. Veins branched
 16058 Cap submembranac. funnel-shap. waved yellowish or olivac. brown, Veins anastomosing, Stipes holl. yell.

- 16059 Effused large yellow ferruginous or deep orange: margin white and cottony, Veins large forming irregular pores by their sinuosity

16060 The only species

- 16061 Sessile pale with a woody aspect, Cap suberose rugose glab. Hymenium contorted sinuose anastomosing
 16062 Cap somewhat corky depressed rather velvety subferruginous, Hymenium composed of labyrinth-like pores grey flesh-color. Stipes irregular central or nearly lateral
 16063 Sessile pallid, Cap coriaceous banded downy, Lamellæ straight somewhat branched
 16064 Sessile, Cap corky-coriaceous banded rough brownish, Recesses labyrinth-like cinereous
 16065 Sessile cinereous, Cap coriaceous villous banded, Recesses unequal somewhat flexuose becoming ragged
 16066 Sessile whitish, Cap corky villous projecting and gibbous at base, Pores linear straightish
 16067 Sessile, C.p corky downy banded brownish-cinereous, Pores long narrow olive-yellow

- 16068 Large, Cap fleshy pale dirty-yellowish with broad dark-colored scales, Pores large angular whitish becoming mere reticulations at the base, Stipes very short
 16069 Sessile orange-colored, Cap imbricated lobed villous, Pores large deformed

and Miscellaneous Particulars.

Upon the trunks of leafy trees through all Europe and Asia, the Cold Coast, Cape of Good Hope, North America, the Antilles, and South America.

2571. *Dactylea*. So called from its sinuosities, which appear as if arranged with *Dædalean* art. Most of the species grow upon wood. The dried substance of *D. quercina* is a good styptic. *D. suaveolens* has, according to Bolton, a smell like aniseed; and Linnæus mentions, that the Laplanders carry it about them when they visit their mistresses, in order to render themselves more agreeable. From the powder of the plant is prepared an electuary which is said to have been used with success in cases of phthisis. The dose from a scruple to a drachm.

2572. *Polyporus*. From *πολυς*, many, and *πορος*, a pore, on account of the multitude of pores which constitute its hymenium. *P. squamosus* is a common species on trunks of willows, oaks, walnuts, &c. From this was extracted, by Braconnot, the Fungic acid. It is colorless, does not crystallize, has a very sour taste, and when evaporated & dryness, deliquesces upon exposure to the air. The fungates of potash and soda do not crystallize, are very soluble in water, but not in alcohol. The fungate of ammonia crystallizes in regular six-sided prisms. The fungate of lime is not altered by exposure to the air, and is soluble in about eighteen times its weight of water at seventy-three degrees.

P. Tuberastrer, a species common in Italy, in various parts of the kingdom of Naples, and the Pontical states, is held in the highest esteem as an article of Neapolitan cookery. *P. annosus*, a Swedish species, is used by the peasantry as a cure for the bite of snakes. Fries says, that he saw the blood which was flowing from the mouth of a kid which had been hurt stopped in a short space of time by its application. From *P. dryadeus*, the *Boletus pseudo-ignarius* of Bulliard, Braconnot obtained his Boletic acid. The color of this principle is white; it is not altered by exposure to the air, and its crystals are regular four-sided prisms. Its

History, Use, Propagation, Culture,

taste is similar to that of tartar. It is soluble in 180 times its weight of water, at a temperature of sixty-eight degrees, and in forty-five times its weight of alcohol. The aqueous solution reddens vegetable blues. It combines with the different bases forming boletates, which have been but little examined. The boletate of ammonia crystallizes in flat four-sided prisms, and is soluble in twenty-six times its weight of water at sixty-eight degrees. The boletate of potash is very soluble in water, and crystallizes with difficulty. The boletate of lime crystallizes in flat four-sided prisms, and is soluble in about 110 times its weight of water at seventy-two and a half degrees. Polyporus fomentarius is much used on the continent for making Amadou; also very generally in the Highlands of Scotland for the same purpose by the shepherds, who manufacture it for themselves.

- 16070 Cap fleshy coriaceous thin smooth brownish, Pores very small roundish white, Stipes short pallid
 16071 Cap soft fleshy somewhat umbilicated villous sooty pallid, Pores somewhat angular white, Stipes pallid
 16072 Cap coriaceous velvety zoned, Pores minute at length lacerated, Plant cinnam.-col. Stipes central
 16073 An obscure species scarcely known
 16074 Cap concave rich brown scaly, Pores white very short, Stipes whitish thick short
 16075 Cap rigid glab. smooth, Pores minute round, pallid, Stipes short smooth pallid abruptly black downwards
 β Cap rigid glab. smooth, Pores small round, pale, Stipes short smooth pale, suddenly black at base
 γ Cap yellow ochre-color or whitish
 16076 Cap corky and stipes smooth shining, Pores minute round pale
 16077 Much branched, Caps halved rugosa sooty-grey, Pores white [Pores excessively short min. round whit.
 16078 Imbricated scarcely reflex. whit. or brown.-grey, Cap betw. corky and coriac. thin velvety obscure. zoned,
 16079 Imbricated multiplied, Caps very broad somewhat banded pale-brown, Pores unequal pale
 16080 Multiplied sub sessile, Caps broad imbricated smoothish reddish-yellow, Pores minute flat sulphur-colored
 16081 Cap subsessile not dimidiate compact smooth pale whitish-brown, Pores white small unequal
 16082 Whitish, Cap fleshy rugose hispid obtuse, Pores short roundish
 16083 Cap fleshy subsericeous white changing to bluish, Pores minute white irregular lacerated
 16084 Cap dimidiate large somew. fleshy thick villous ferrugin. Pores yellowish pale and fringed at the orifices
 16085 Caps fleshy corky downy ferruginous, Pores shining greyish ferruginous
 16086 Caps fleshy tough villous pale: margin straight blackish, Pores minute round cinereous
 16087 Cap fleshy corky not banded glabrous pallid, Pores small equal
 16088 Cap fleshy corky not banded villous white, Pores largish brownish [brown short irregular
 β Sess. or dimid. bet. suber. and coriac. round. smooth white at length brown. Pores white becom. yellow.
 16089 Cap mostly reflexed coriaceous villose variegated by zones of different colors, Pores round white short.
 16090 Caps coriaceous streaked in rays somewhat velvety brownish-yellow, Pores minute [lacerating
 16091 Caps coriaceous smooth not banded pale ochre-color, Pores equal [lacerating
 16092 Effused but at length mostly reflex. Cap thin coriac. vill. white, Pores violet at length brown. and toothed
 16093 Cap subtriangular glabrous dark brownish-grey soft within: margin pale glaucous as well as the pores
 (which are very minute) but at length ferruginous
 16094 Hard, Cap thick obtuse smoothish mostly ferruginous blackish at the base banded: margin convex,
 Pores minute greenish at length cinnamon-color
 16095 Effused coriaceous-spongy ferruginous, Pores straight round minute
 16096 Effused somewhat wavy hard smooth dry white, Pores middle-size
 16097 Broadly effused thin dry smooth white, Pores minute subequal
 16098 Effused thick portions sometimes growing out horizontally ferrugin. Pores round. very uneq. Flesh none
 16099 Effused thin soft white with a fibrous circumference, Pores thin unequal
 16100 Effused coriaceous very thin submarginate, Pores orange flesh-color minute round suboblique

- 16101 Very fine resembling byssus fugacious white, Pores distant cupuliform powdery
 16102 Effus. entirely resupin. very thin white: marg. membran. laciniat. Pores min. subhexagonal very shallow

- 16103 Cap glutinous varying from bright-yellow to fulvous: tubes adnate yellow, Stipes firm with an annular veil
 16104 Cap red-buff, Pores yellow, Stipes bright-yellow, Juice like milk
 16105 Cap redd. or brownish-yell. smooth: tubes adnate somew. decurr. large ferrugin. Stipes smooth deep-yell.
 16106 Cap round. dry subtoment. reddish or olivaceous: tubes adnate large angul. yell. Stipes very firm smooth
 16107 Cap convex subtomentose mostly olivaceous: tubes nearly free round yellow; the orifices crimson-red,
 Stipes thick reticulated with crimson-red
 16108 Cap convex smooth cinereous yellow or brown: tubes nearly free roundish minute whitish at length
 yellowish, Stipes thick reticulated: flesh white not changing color
 16109 Cap convex glabrous: tubes free round whitish, Stipes firm attenuated upwards scabrous
 β Cap somewhat rufous with black scales
 γ Cap slightly glutinous reddish-brown thin: tubes adnate compound yellowish, Stipes smooth
 16110 Cap compact somewhat downy: tubes loose round equal, Stipes solid smooth ventricose

16111 The only species

and Miscellaneous Particulars.

2373. *Boletus*. Pliny, Casalpino, Porta, and others, call these plants Suilli. The Boleti, from βολος, a field, in allusion to the places where they are found) of the Romans were terre-trial Fungi, and more particularly *Agaricus caesareus*. By Tournefort these were called Phalloidei; by Micheli, Morehelle. The species grow singly upon the ground, are succulent, and have their parts in the greatest perfection of any fungi. *B. granulatus* is eatable, according to Persoon; so is *Boletus subtomentosus*. *Boletus edulis* is excellent when cooked.

2374. *Fistulina*. So called from the fistulous nature of its tubes; the genus is just intermediate between *Boletus* and *Hydnum*, to the former of which it bears the same resemblance as *Schizophyllum* to *Agaricus*. There is only one species, and it is said, by Persoon, to be eatable.

History, Use, Propagation, Culture,

2375. *Hydnum.* The Greeks had their *ὄδνα* and *ἄδνα*, tumours, which were analogous to the tubers of the Romans. *H. coralloides* is eatable; so is *H. leoninum*, a Swedish species. A very extensive genus of fungi, chiefly found in moist situations upon the trunks of trees. The pileus is furnished on its lower surface with numerous awl-shaped bodies, which Linnaeus compares to the prickles of a hedgehog; they are soft, solid, conical or cylindrical substances, emitting spores from every part of their surface.

2376. *Sistostrema.* So named from *συσσιναι*, part. *συσσιναι*, compounded, and *στρομα*, an orifice, in allusion to the regular rows of pores. Intermediate between the *Agaricus* and *Hydnum*. Gregarious, becoming concrete, fragile, scutless, white, becoming yellow in age. The pilei are thin, somewhat fragile, from half to one inch

1. *Stem perpendicular, Cap distant, round, nearly entire.* GROWING ON THE GROUND.

- 16112 Cap fleshy flat tessellated scaly not banded umber-colored, Processes buffish-cinereous, Stipes short
 16113 Cap fleshy smooth subrepand buffish, Subulate processes of hymenium unequal pale, Stipes unequal thick
 16114 Cap fleshy orbicular somewhat tomentose brownish flesh-color, Processes nearly equal, Stipes thin equal
 16115 Cap coriaceous tomentose, Stipes lateral tomentose

2. *Stem simple, somewhat horizontal, Cap halved, or out of the centre.* FLESHY. GROWING ON WOOD.

- 16116 Cap gelatinous papillose, Processes soft pyramidal glaucous, Stipes short lateral
 16117 Very large heart-shaped white becoming rather yellow, Cap subsessile fibrous torn, Processes very long
 3. *Cap confounded with the stem, obliterated.* FLESHY. GROWING ON WOOD.
 16118 Much branched white becoming yellow, Branches entangled tapering, Processes unilateral subulate

4. *Cap sessile, lateral.* GROWING ON WOOD.

- 16119 Cap coriaceous lobed scaly plaited rufous brown projecting behind, Processes imbricated pale rufous
 16120 Effuse-reflexed, Cap coriaceous thin banded ochre-colored, Processes minute numer. ochre-flesh-colored
 16121 Coriaceous woolly spherical orange-color, Processes short erect

5. *Cap resupinate, effuse.* GROWING ON WOOD.

- 16122 Effused thin glabrous tawny-ferruginous, Processes in the middle straight
 16123 Effused downy pale-white, Processes rounded pubescent at the end bearded with orange
 16124 Effus. white at length yellow, with a byssoid marg. Process of hymen. oblique subent. compr. vill. at apex

16125 The only species

16126 Effused soft sulphur-colored: the circumference expanded and byssoid, Plaits distant irregular

1. *Cap entire, with a stem.* TERRESTRIAL.

- 16127 Corky pale, Cap depressed scaly beneath smooth somewhat pilose
 16128 Somew. tuft. stipit. or sess. Cap irregul. rarely quite ent. striato-fibr. purplish-brown: marg. often lacinate

2. *Cap lateral, somewhat stipitate.* TERRESTRIAL.

- 16129 Irregularly tufted dark fuscous, Cap rather thick striato-fibrous sessile often imbricated sometimes with a very short lateral stipes
 16130 Ferruginous brown, Caps fibrous scaly ragged and crisp at their edges

3. *Cap and stem confounded, running into compressed branches.* TERRESTRIAL. *Merisma.* Pers.

- 16131 Erect purple-brown, Branches compressed palmate folded paler at the summit
 16132 Somewhat ferruginous, Branches glabrous obtusely ragged fastigiate
 16132 Subdecumbent pale greyish or yellowish, Branches effused plane expanding fimbriato-lacinate
 16133 Erect distinct stipitate reddish-grey, Cap with branches of nearly equal length, Stipes bulbous at base

4. *Cap sessile, lateral.* GROWING ON WOOD.

- 16134 Imbricated rigid somewhat zoned purplish reddish-brown glabrous, Hymenium papillose minutely velvety rubiginous paler at the margin
 16135 Effuse-reflexed thin silky ferruginous margined downy beneath

16136 Somewhat imbricated bandless smooth on each side very smooth dull-brown

16137 Effuse-reflexed coriaceous strigose, Hymenium smooth yellowish or orange-buff

16138 Effuse-reflexed somewhat membranous striated pubescent beneath smooth and ochraceous

16139 Imbricated subcoriaceous zoned hirsute, Hymenium smooth purple

16140 Imbricated velvety zoned pale reddish-buff, Hymenium smooth irregularly papillose buffish at length ferruginous sometimes shooting out into rude stems anastomosing and producing irregularly caps

16141 Round thick often confl. Marg. waved splitting, Hymenium tuberculose yellow or reddish-brown crack.

16142 Broadly effused thickish. The margin slightly reflexed, Hymenium ochraceous unevenly papillose

16143 Coriaceous broad thin, Margin free with the surface tomentose, Hymenium smooth minutely reticulated buff becoming darker in age

16144 Effus. very broad thin, Hymen. somew. of an ochrey pale-yell. smth. or with scatter. uneq. false papillae
 16145 Resupinate, Margin free whitish hirsute, Hymenium fuscous smooth somewhat shining and faintly zoned towards the margin cracking in a radiated manner

16146 Circular effused, Margin sometimes free rarely reflexed, Hymenium pale whitish-brown pruinose silky and minutely byssoid at the margin turning red when wounded

and Miscellaneous Particulars.

broad, somewhat depressed, flexuose, and apt to grow to one another. The only species is found in August and November by the side of sandy paths in pine-groves.

2577. *Phlebia*. So called, from $\phi\lambda\beta\alpha$, a vein. As the last was intermediate between *Agaricus* and *Hydnum*, so is this between *Cantharellus* and *Thelephora*. As that differed from *Dædalea*, does this from *Merulius*. The species are all found upon bark, late in the year. No species was described before the writings of Fries. *P. merisoides* is an elegant little plant, distinguished by its reddish-flesh-colored hues. It is found occasionally spreading over wood and smooth bark; and sometimes runs with its papillose very branches among mosses.

2578. *Thelephora*. So called, from $\theta\epsilon\lambda\epsilon\alpha$, a nipple, and $\phi\epsilon\alpha$, to bear, in allusion to the papillose surface of

History, Use, Propagation, Culture,

of the pileus of all the species. *T. caryophyllæa* is very common upon the exposed roots of old firs in the autumn. The substance is tough and somewhat woody; the color a chocolate brown. The plants often grow in masses, attached by their upper side to sticks, old bark, &c. and are from one to three inches in diameter.

2379. *Clavaria*. So called, from the simple clavate form of the species. Some are eatable; as for instance *C. flava*, which is said to be delicious; *C. cinerea*, which is frequently eaten in France; *C. pyxidata* is said by Persoon to be tolerably good. Loureiro has also an eatable species found in Cochín-China, growing upon elephant's dung.

5. *Cap obliterated, resupinate. GROWING ON WOOD.*

- 16147 Resupinate rigid nearly black beneath, Hymenium flesh-color rugose and papillose at length cracking
 16148 Very thin effused cracking and becoming invol. very dark ben. Hymen. brown-grey minutely farin. papill.
 16149 Effus. extremely thin, Marg. appress. minutely vill. Hymen. purp.-grey cover. with small uneq. papillae
 16150 Effused thin smooth, Margin delicate and byssoid, Hymenium whitish at first at length very pale-built,
 Papillae scattered or none
 16151 Effused spreading over moss, &c., Margin fibrous, Hymenium very unequal tuberculose yellowish
 16152 Effused unequal in thickness hard, Hymenium white glabrous cracked in different directions so as to be
 often tessellated obtusely papillose
 16153 Effused membranaceous thin, Margin entire, Hymenium very white glabrous subpapillose
 16154 Membranous smooth plaited at base whitish becoming blackish
 16155 Effused membranous smooth pale beneath white with cobweb-like down
 16156 Effused somewhat rugose soft of a violet-brown: at the margin and beneath downy
 16157 Mostly on dead leaves, Filaments very fine white radiating dilated at the extremities in a plumose manner
 16158 Broadly effused thin dry smooth glabrous cinereous

Division II. *Clavati.** *Much branched, Stem thick.*

- 16159 Deformed, Stipes decumbent very thick pale, Branches short somewhat wrinkled red at ends
 16160 More erect, Stem thick white, Branches straight round fastigiate yellow
 16161 White erect, Stipes thick, Branches elongated irregular unequal mostly acute
 16162 Dull ochrey-yellow much branched white and tomentose at the base turning green when bruised,
 Branches erect crowded slightly rugose with acute often forked summits
 16163 White or ciner. tuft. branch. smooth, Branch. dilat. at summ. and jagged or shortly but acutely laciniate
 16164 Grey often with a bluish or a purplish tinge much branched unequally incrassated rugose often subcom-
 pressed, Summits either very obtuse or somewhat acuminate
 16165 Yellow half an inch high branched or nearly simple viscous, Stipes of several plants connected at the base

** *Branched, Stem thin.*

- 16166 Much branched pale brownish, Branches and branchlets straight appressed acute
 16167 Yell. tuft. Stipes short producing numer. short geniculate divaricate branches: the ramuli subfastigi. obt.
 16168 Yellow erect much branched in a dichotomous manner, Branches slender with acute summits
 16169 White gregarious incrassated rugose simple or branched, Branches few short obtuse

*** *Simple, clavate.*

- 16170 Solitary large glabrous yellowish-brown thickened upwards and obtuse
 16171 Very long hollow thickened upwards brownish downy at base
 16172 Heaped fascicled yellow, Branches nearly equal incurved yellow
 16173 Fascicled unequal subdivided hollow yellowish-brown at end [irregular at the apex
 16174 Yell. or yell.-white tuft. or gregarious fragile uneq. ventric. deformed somew. acum. often bifurcate and
 16175 Yellow or white gregarious sometimes subcespitose solid or hollow very brittle rather firm attenuated at
 the base subrugose in age and often crooked
 16176 Straight white, Head distinct round acuminate as long as stipes
 16177 Stem slender villous, Branches long compressed, Branchlets numerous setaceous cut.
 16178 Yellow gregarious cylind. equal smooth obd. slender below and paler, apex frequently of a cinnamon-color
 16179 Pure white tuft. crowd. subul. flexuose solid but with a small perforat. mostly somew. connected at base
 16180 White gregarious round club-shaped obtuse much attenuated at the base smooth not brittle
 16181 White minute, Hymenium oblong or ovato-clavate passing suddenly into a filiform pilose stipes

- 16182 Tough yellowish nearly simple, Stem tuberous long-rooted
 16183 Tufted smaller simple and branched viscid yellow connate at base

- 16184 Stipes hirsute deep-black, Hymenium somewhat plicate

and Miscellaneous Particulars.

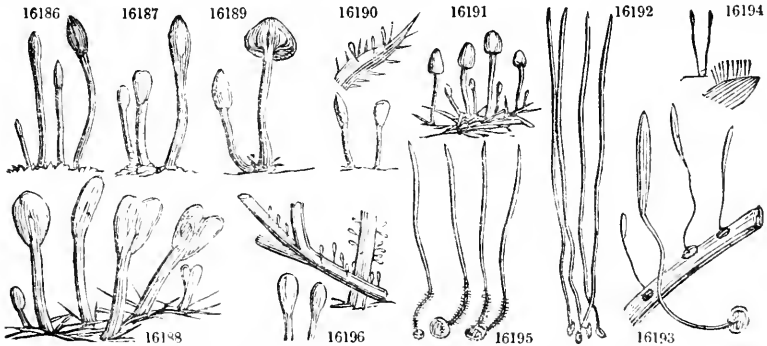

280. *Calocera*. From *καλος*, beautiful, and *κερας*, a horn, in allusion to the divisions of the plants. They grow on wood, and are either brown or yellow; but their sporidia are generally white. *C. viscosa* is at once distinguishable by its beautiful gold color. Some of the species adhere to paper when dry.

281. *Geoglossum*. From *γειν*, the earth, and *γλωσσα*, a tongue; earth-tongue; in allusion to the simple form of the species, which all grow upon earth, and are of a blackish or dark-green color. Fries considers the genus to be scarcely distinct from *Clavaria*.

History, Use, Propagation, Culture,

2382. *Spatularia*. A very distinct genus, named from its *spatulate* form. The only species known is an autumnal epiphyte, common on fallen leaves, decaying mosses, &c. Its color is at first pallid; afterwards it becomes yellow and ferruginous; but the stipes retains its paler color. It is found in plantations in various parts of England. In a state of perfect maturity, the head, on being touched, throws up its spores in the form of smoke, which rises with elastic force, and glitters in the sunshine like particles of silver.

2383. *Mitrala*. So called from its *mitrate* form. The species are small epiphytes with a simple stem.

2384. *Typhula*. A diminution of *Typha*, a well-known marsh plant, the heads of fructification of which this genus resembles in miniature. All the species are delicate, and are found upon decayed leaves, or even occasionally upon *Sclerotias*.

2385. *Pistillaria*. So called from its *pistil*-like form. The species are all small, delicate epiphytes, appearing in the autumn.

2386. *Morchella*. A name altered by Dillenius from *Morchel*, the German name of the plant. Fungi of a large size, appearing in the spring upon the earth. The eatable morel is one of the most valuable of fungi for purposes of cookery; but is more frequently used in a dried state for sauces, than when fresh. It is found in greatest abundance in places where trees have been burned, which led in Germany to a practice of burning down masses of forests for the sake of the future morels. This practice proved so injurious, that it became necessary to suppress it by law. The morel is subject to many variations of figure and color, which are all referable to four principal forms. But there are also some legitimate species which have been distinguished by modern botanists. Of these it is not ascertained which are natives of England; but it is probable, that they are all to be found if sufficiently sought for. Without, therefore, absolutely inserting them in the list of British species, it cannot be otherwise than useful, considering the importance of an accurate knowledge of the eatable fungi, to enumerate the two principal in this place.

1. *M. Deliciosa* is found in the spring, among grass and bushes by the sides of fields in France, and is said to be much superior in flavor to the *M. esculenta*. Its stipes is hollow, and shorter than the pileus, scarcely ever so much as an inch long, about three or four lines thick, nearly equal in the whole length, but sometimes thickened and compressed at the base; under a lens covered with a slight downiness. Pileus is conical-cylindrical, from one inch to two inches and an half long, with nearly parallel ribs, which can scarcely be said to

16185 Glabrous dry blackish, Stipes somewhat scaly [thin and attenuated downwards
 16186 Smooth very slimy in moist weather black, Hymen. cylind. round, at apex confluent with stipes which is
 16187 Green somewhat fasciculate, Hymenium distinct, Stipes minutely scaly

16188 The only species

16189 Yellow subgregarious, Cap orange-yellow obtuse hollow: margin connate with the stipes
 16190 Very small, Head lanceolate yellow, Stipes equal paler
 16191 Gregarious solid, Hymenium ovate yellow cinnamon, Stipes slender dark-brown flexuose at the base

16192 White filiform elongated somewhat villose at the base radicular tuber dark fuscous lenticular
 16193 Gregarious min. Hymenium smooth white short terminat. in an elongated filiform dark pink-red stipes
 16184 Simple smooth dark thickened at end
 16195 Somewhat branched spadiceous, Heads thickened whitish

16196 Thickened towards the extremity white confluent with the stipes

Class II. UTERINI v. ELVELLACEÆ. — Division I. *Mitrati*.

16197 Cap round, or oval: marg. contract. round the stipes, Areolæ much hollow. Stipes white dilat. tow. base
 α Cap and areolæ round
 β Cap oval, Areolæ quadrangular
 16198 Cap obtuse separate as far as the middle, Areolæ rhomboid, Stipes smooth [thick white
 16199 Cap short conic. spread. at base, Areolæ shall. partly formed by longitudin. parallel ribs, Stipes long equal

* Cap waxy, membranous, at first united, afterwards wavy in plaits.

16200 Cap irregularly deflexed free often variously lobed yellow-white, Stipes deeply sulcate and lacunose white
 16201 Cap dark-livid inflated deflex. and partially adnate with stipes, Stipes deeply furrow. and lacunose white
 16202 Cap inflated deformed wavy wrinkled in circles brown, Margin villous adhering to the smooth stipes
 16203 Cap deflexed lobed adnate about cinnamon-colored, Stipes smoothish villous pale

** Cap somewhat membranous, smooth, always separate.

16204 Cap loose smooth inflated becoming sharply lobed, Stipes long thin tapering pruinose

16205 Cap campanulate smoothish fuscous somewhat sinuated at the edge: beneath and the stipes yellow

and Miscellaneous Particulars.

anastomose, but which are united by transverse rugosities. The color is usually yellowish, rarely of a pale livid hue.

2. *M. elata* has a longer stipes than the last, an inch and more thick, very hollow and brittle, with irregular cavities. The pileus is ovate-conical, two or three inches long, and a shorter pileus, which is more conical and acute. *M. patula* is considered by Fries to have been confounded, in Mr. Sowerby's fine work on Fungi, with *Helvella esculenta*.
 287. *Helvella*. A name employed by Cicero, as the name of a fungus. The species of the modern genus are permaecent, somewhat fragile fungi, with little odor or taste, but always innocuous. They grow on the earth or upon very wet wood, and are chiefly found in the autumn. *H. crispata* is excellent as an article of cookery. *H. lacunosa*, which is confounded with it, is by no means so good. *H. esculenta* has a good flavor, and is commonly eaten, but is far inferior to *Morella esculenta*. Its qualities are nearly the same as those of the latter plant, and it is popularly confounded with it under the name, in Sweden, of *Stenmorikla*, and in Germany, of *Gemeine Morehel*, *Stumpf Morehel*, and *Stockmorehel*. *H. infula*, a large species, with an inflated smooth pileus of various hues of brown, is also esculent. This last plant is the true *H. Mitra* of Linnæus, and old botanists; a name which, having been applied by one writer or other to every species of *Helvella*, is now abandoned altogether in order to avoid further confusion.

288. *Verpa*. An old Roman name synonymous with Phallus, and restored to modern science by Swartz. The species are meteoric, terrestrial, and intermediate between the Morels and *Leotia*. The hymenium is covered, as is the case with many *Mitrati*, with a frost-like flocculence, which Swartz mistook for sporules, but which more recent observation has shewn to have been a mistake.

History, Use, Propagation, Culture,

2389. *Leotia*. Named by Sir John Hill, of famous memory, for no known reason. Gregarious terrestrial substances of the middle size, appearing in summer or autumn, without smell or taste. They are most nearly akin to *Helvella* and *Verpa*, from which they differ in form and substance. The species are not known to be eatable, with the exception of *L. amara*, a native of Cochín-China, which is capable of being deprived of its native bitterness by long stewing.

- 16206 Cap depressed cinereous livid smooth on each side, Stipes solid smooth
 16207 Dwarf, Cap rugose white beneath smooth brown, Stipes solid cylindrical white
 16208 Tremellose, Cap tumid spread, olivac. : margin rounded, Stipes orange-cylindr. or unequally compressed

Division II. *Cupulati.*1. *Cupule always open, or when young conniving, Veil superficial, Sporidia with two smaller sporidia.*

HELVELLOIDEÆ.

- 16209 Cyathiform sooty velvety on the outside arising from a short fistulous pitted stipes
 16210 Subsess. ent. flexuose brown, Margin at first involute externally pruinose paler and somewhat olive-colored
 16211 Substipitate lengthened on one side ear-shaped somewhat ferrugin. mealy outside smooth inside at the base
 16212 Substipitate lengthened on one side ear-shaped farinaceous outside pink inside becoming rugose at base
 16213 Gregarious flexuose very brittle white externally, Hymenium fine orange
 16214 Caspitose large very brittle externally lemon-colored becoming wrinkled pale flesh-color inside
 16215 Gregarious caspitose variously contorted externally yellowish-brown, Hymenium dull reddish-brown
 16216 Large funnel-shaped repand yellowish villous and whitish outside and upon the stipes-like base [base
 16217 Gregar. caspit. glob. at first with mouth conniv. at length campan. split, externally whit. and toment. at
 16218 Sessile solitary or somewhat tufted large at first hemispherical and concave at length nearly plane sub-
 rugose and brown within the outer surface farinose whitish, Margin crenate

2. *Cupule at first closed, Veil innate, Sporidia simple.* GEOPYXIS.

- 16219 Subgregarious large: the pileus hemispherical slightly hairy and verrucose ash-colored; the hymenium
 mouse-colored at length pale, Stipes very long incrassated below
 16220 Thin, Cupule funnel-shaped brownish pallid, Stipes long seated on a black deformed root
 16221 Subsessile thin globose campanulate brownish or pale mealy outside crenate at edge
 16222 Sessile yellowish smooth at first ureolate afterwards cracked and torn with hairs about the root outside
 16223 Sessile minute flattish orange-red externally granulated with pimples [Stipes usually short and thick
 16224 Centre plicate and reticulated. Without whit. and pruin. Cap invol. at margin variously split somewhat spread.

3. *Cupule a little fleshy, small, Veil floccose only at the edge, or fuscaceous, Sporidia with a solitary little sporidium.* HUMARIA.

- 16225 Sessile clustered subcylindrical smooth somewhat yellow becoming dilated with an erect subciliated orifice
 16226 Sessile fleshy plano-convex smooth crimson entire at margin

4. *Membranaceous, bursting forth with a separating veil, Sporidia simple.* ENCELIA.

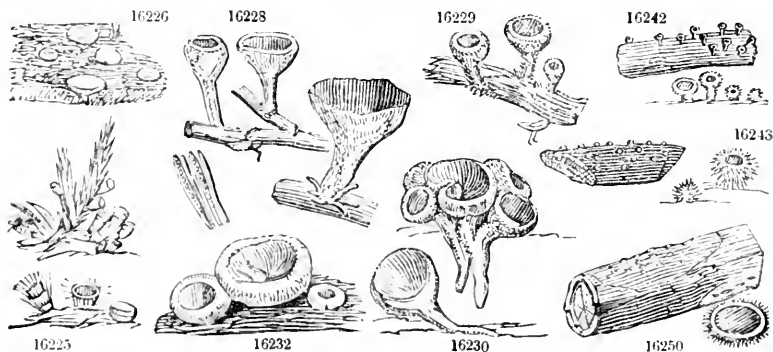

- 16227 Subcaespitose sessile coriac. membran. Margin split ragged externally scurfy and brown, internally white

1. *Cupule fleshy, or fleshy-membranous. Crust none.* SARCOCYPHE.

- 16228 Stipitate large subinfundibuliform externally white and tomentose, Hymenium crimson-red
 16229 Cupule fleshy, Disk ureolate black externally rubiginous-flocculent, Stipes short down dense dark strigose
 16230 Subcaespit. fleshy sess. from hemispher. becom. flatten. Disk sulph. external, and thick root white and vill.
 16231 Sessile hemispherical wavy brownish externally covered by dense fasciated hairs, Disk glaucous white
 16232 Sessile subhemispher. externally fuscous hairy with somewhat inflexed margin, Vermilion colored inside
 16233 Min. sess. or subsessile hemispher. externally tomentose-pulverulent yellowish-olive, Hymen. dull ochrac.
 16234 Sessile gregarious or scattered nearly plane: external surface of the margin hispid with black rigid hairs,
 Hymenium orange-red
 16235 Sessile gregarious very minute orbicular somewhat depressed substrigose brown or nearly black
 16236 Plane ciliated blackish externally, Hairs pale, Disk blue [at margin, Hymenium gently umbonate
 16237 Small sess. gregar. whole plant white glob. concave at length quite plane ciliated with horizontal white hairs
 16238 Gregarious concave tawny externally surrounded near the edge with straightish brown hairs [white
 16239 Sess. gregar. glob. at length quite plane, exter surface and marg. strig. with redd.-brown hairs, Hymen.
 16240 Sessile gregarious small globose at length plane: the strigose external surface yellow, Hymenium white
 2. *Cupule waxy, dry, villous, Crust none.* EPIPHYTES. DASYCYPHE.
 16241 Stipitate gregarious small, Stipes rather long, Pileus hemispherical subpatulose villous, whole plant white
 16242 Subsess. small gregar. externally very white vill. Mouth contract. Hymen. varying from dil. yell. to orange
 16243 Sessile hemispherical orbicular rather firm flocculent, Disk ureolate whitish
 16244 Sessile distinct concave villous hairy milk-white on each side granulated at edge
 16245 Sessile very minute gregarious white subglobose villous, Mouth more or less connivent
 16246 Sessile minute gregarious depressed externally fusco-olivaceous villous, Hymenium smooth bluish-grey

3. *Cupule waxy or coriaceous, seated on a downy crust.* TAPESIA.

- 16247 Substipitate much crowded form. a crust, Cupules turbinate vill. light bistre-colored: disk urecol. whitish
 16248 Sessile gregarious obovate strigose rufous
 16249 Sessile gregarious ovate globose golden-yellow strigose with a subjacent woolly paler web
 16250 Carn. sess. Cup. concave brown at length plane grey: marg. glab. attach- by fibres to a wide toment. web

and Miscellaneous Particulars.

2200. *Peziza*. Pliny had a tribe of Fungi which he called *Pezica*, from which the modern name has been corrupted. The present genus is very extensive, but almost wholly of modern creation. The species are found in various situations, but chiefly on decayed wood. They are remarkable for their leathery texture, and for emitting their sporules in the form of smoke from the bottom of their cup.

History, Use, Propagation, Culture,

2391. *Ascobolus*. From *ascus*, one of the forms of theca in which the sporules are retained among Fungi, and *εσκαλα*, to emit, in allusion to the principal peculiarity of the genus. Small gregarious soft plants, without roots, but not very perishable, growing upon dung, and most obvious during rainy weather.

2392. *Bulgaria*. An intermediate genus between *Periziza* and *Exidia*, named from *bulga*, a leather bag, on account of the saccate form of the species. Scentless, insipid, mucilaginous, rootless, soft fungi, tolerably permanent, and generally breaking forth in clusters from the bark of trees during the winter and autumn. Miller is said to have succeeded in obtaining glue from *B. inquinans*, but subsequent attempts have failed of success.

2393. *Ditiola*. From *δις*, double, and *ισλας*, down, in allusion to the nature of the pubescence of the velum. The species of this genus are gregarious, firm, permanent, without smell, flourishing upon dry wood from the

1. *Cupule somewhat membranous, distinctly stalked, Hymenium distinct.* HYMENOCYPHE.
 16251 Rather large ochrey-brown infundibulif. at length concavo-veg. or very plane, Stipes elongat. dark at base
 16252 Cap smooth urceolate orange-color with a prominent membranous pale margin, Stipes cylindrical pink
 16253 Gregar. yell. or redd.-white subfundibulif. : surface of hymen. plane, Stipes long subflexu. and attenuat.
 16254 Bright-yellow. Cupule plano-convex thinish, Stipes short firm thickish
 16255 Stipit. glab. white or yellow subfundibulif. Margin fringed with inflexed teeth, Stipes elongated curved
 16256 Stipitate campanulate, Margin smooth, Stipes straight

2. *Cupule fleshy, waxy, firm, obconical, somewhat stalked, Hymenium distinct.* CALYCINE.
 16257 Yellow, Cupule turbinate : disk flat ; margin tumid, Stipes long slender [orange-brown
 16258 Gregarious globose-infundibulif. slightly concave, Stipes rather short attenuat. whole plant ferrugin. or
 16259 Æruginose, Cupule turbinate becoming expanded and flexuose : disk whitish, Stipes short

16260 Cupule subrepand smooth : disk yellow exteriorly white as well as the somewhat ascending stipes
 16261 Yell. crowd. apparently sess. but having a short thick obconical stipes carnosé, Hymenium plano-concave

16262 Crowded smooth pale-yellow or whitish, Cupule concave, Stipes short thickish pallid
 16263 Hemispherical margined, Disk yellowish externally sooty, Stipes very short whitish
 16264 Gregarious white rather small very membranous campanulate unequal, Stipes filiform short
 16265 Black solitary rather large very concave, Hymen. cribriform or full of lacerae, irregular pores or sinuses
 16266 Yellow gregarious minute obconical at length somew. plane, Margin raised obt. externally somew. paler
 16267 Yellow very minute gregarious punctiform globular at length plane or subconvex, Margin minutely cren.
 16268 White gregar. carnosé at length convex but sometimes depress. in centre turning reddish in age and decay

3. *Cupule waxy, soft, watery, sessile or obconical, Hymenium confluent.* MOLLISIA.
 16269 White gregarious excessively minute orbicular submarginate
 16270 Fulvous orange gregarious crowded minute nearly plane subretremella-like
 16271 Grey gregarious depressed waved subtremellose, Margin obsolete
 16272 Sessile somewhat tufted membranous soft smooth whole-colored all over and whitish

β Scattered flattish-urceolate whitish transparent [in wet weather
 16273 Minute ceraceous glab. sess. grey connate within the semiputrid petioles of the Sycamore and burst forth

4. *Cupule waxy, dry, sessile, flat at base or innate edged.* PATELLIA.
 16274 Ochrey-brown min. gregar. carnosé-thick obconic. Hymen. minutely granul. at length plane or subconvex
 16275 Green gregarious minute subtremellose hemispherical at length plane becoming black in decay
 16276 Sessile dry patellate caesious on the outside, Disk yellow

16277 Firm, Head convex yellow black-brown beneath, as is the short thick villous stipes
 16278 White smooth, Head convex, Stipes long equal

16279 Sessile gregarious somewhat concave olive-green or brownish externally furfuraceous

16280 Turbinate firm, externally rugulose sealy uniber-colored, Disk flattish blackish
 16281 Polymorphous caspitose subgelatinous somew. firm purplish-red externally subvenose, Hymen. concave

16282 Disk flattish golden-yellow, Stipes thick villous white long-rooted

16283 Simp. gregar. long flexil. at first closed pruin. and blackish-cinereous, afterw. open with a broad pale disk

16284 Substipitate opaque rigid black marginate, Hymenium concave
 16285 Coriaceous reddish-black at first closed at length expanded and plane
 16286 In round tufts, Caps stipit. subturium. concave with round. marg. intermix. with digit. or subul. processes
 16287 Gregarious between membrane and leathery subsessile rugose somewhat pruinose, The orifice compressed inflexed : when moist spreading

16288 Immersed orbicular, Limb snow-white ragged pulverulent

and Miscellaneous Particulars.

autumn until the spring. They are to be considered noxious fungi from the injury they bring to the timber upon which they vegetate. Their mucilaginous roots insinuate themselves between the fibres of the wood, and separate and soften them. Their tubercles burst forth, and filling the wood with clefts, and rendering its interior accessible to wet, soon destroy it. D. radicata is one of the species of dry rot.

294 *Cenangium.* From 21065, hollow, and 22710, a capsule or vessel, in allusion to the hollow nature of the receptacle. Chiefly distinguished from Peziza by substance, and the coriaceous nature of the cupules. From Tynanpus it is distinguished by its closed cupules and smooth permanent hymenium. The species are small and detoried, growing upon the bark of trees, either singly or in tufts, and mostly produced in winter.

295 *Stictis.* So named from the punctiform appearance of many of the species, from *stictis*. a dot. Very simple, minute, gregarious fungi.

History, Use, Propagation, Culture,

2396. *Cryptomyces*. Upon this curious addition to the British Flora, Dr. Greville has the following remarks. "This very curious plant, I have little hesitation in placing as a new genus among the true Fungi. It is difficult to say, with what it has nearest affinity. In general habit, it might be supposed to resemble some species of *Thelophora*, but there the comparison stops. Our plant, besides being produced under the epidermis, seems to belong to a more perfect group, when its structure is examined. The hymenium is a quite distinct substance from that of the receptacle. The fructification is fully and beautifully developed, a good deal similar to that of the *Helvella*. The receptacle is carnose and white; and the whole exhales a very strong odor, precisely like what is universally known under the name of a fungus-like smell. Till the plant is perfected, it remains concealed beneath the epidermis; and on this account, I have named the genus *Cryptomyces*. The epidermis, in fact, scarcely seems to crack by the swelling of the fungus, more than by the natural consequence of being killed by its separation from the subjacent bark. A cluster of willows, which was attacked in the beginning of the season by this plant, has been nearly destroyed by it; and, from the rapidity of its progress, I have no doubt that a whole plantation might, in the course of a couple of seasons, be rendered good for nothing. At a little distance, the affected branches look as if they were dry, scorched, and rotten."

2397. *Tremella*. Large or middle-sized fungi, rooting at the base, which is considerably contracted between the bark and the wood of trees. Dillenius named the genus on account of its soft, tenacious, tremulous substance, but his name was applied in a far more extensive sense than at present. The section called *Phyllopta* is an aberrant form of the genus, and should perhaps be separated.

2398. *Exidia*. From $\epsilon\zeta\upsilon\mu\alpha$, to proceed from a thing; with reference to the manner in which the sporidia exude as it were from their receptacle. This genus differs from *Tremella*, to which it is nearest, in its horizontal *Peziza*-like receptacle; in its hymenium being superior, the lower surface being dissimilar and either

16289 Suborbicular olivaceous at length nearly black white within, Theca elongated obtuse

Class III. TREMELLINI.

16290 Sessile roundish orange-yellow variously lobed and plicate

16291 Sessile roundish or spreading and somewhat expanded obtusely lobed and plaited whitish

16292 Sessile clustered tumid plaited shining-brown

16293 Gregarious distinct tender gelatinous simple lingulate dull-orange pulverulent towards the apex

16294 Sessile gelatinous reddish-purple at first club-shaped then rounded lobed plaited or curled finally blackish

16295 Cartilaginous lobed somewhat wrinkled black

1. *Perizoid, plicate, villous beneath, or dotted with roughness, Tubes half inferior, distinct.* AURICULÆ.

16296 Sessile concave flexuose blackish plaited on each side with veins: beneath downy olive-grey

16297 Very soft truncate-flat subrepand fuscous beneath dotted scabrous, Stipes very short oblique out of centre

16298 Thin flaccid very dark, externally opaque, internally wrinkled

2. *Somewhat flattened, wavy, rugose beneath, Tubes half-inferior, obsolete.* GLANDULOSÆ.

16299 Sess. round, rather spread, thick not goyrose plicate ben.: the surface bear, min. white-headed processes

16300 Conglobated sinuous dark opaque fleshy and purple inside

16301 Gregarious entire round depressed pulpy orange-yellow

16302 Gregarious nearly separate convex whitish casious

16303 Long various smooth whitish when dry becoming brown: the circumference adhering

16304 Subsessile pulvinate plaited-rugose pale flesh-color becoming dry

Class IV. SCLEROTIACEI.

16305 Horn-like smooth when dry furrowed rufous becoming paler at the end

16306 Stipitate mostly lanceolate somewhat obtuse subcompressed of a dark olivaceous color

16307 Separate spherical whitish-yellow becoming wrinkled and black, white inside

β Clustered somewhat immersed pale inside

16308 Deformed lobed smooth pale becoming tawny, whitish inside

and Miscellaneous Particulars.

villous or rugose, and ribbed in a peculiar manner; in the conoid papilla of the disk; in the tubes, which must be esteemed rudimentary asci, containing the sporules; and in the elastic manner in which the sporidia are produced. The species are simple, rarely growing in patches, of a large or middle size, and generally inhabiting wood; when dry they are membranous, but nearly regain their original form upon being moistened.

2399. *Daecrymyces*. From *δακρυ*, a tear, and *μυκης*, a fungus; in allusion to their deliquescent nature. Tremella deliquescentis of Bulliard, a yellow confluent mass found chiefly upon pine-timber in the spring, is the type of the genus.

2400. *Agyrium*. Apparently from *αγρις*, a crowd, in allusion to the clustered disposition of the individuals; although Fries, the author of the name, expressly declares that it has been named "ob superficiem nunquam nor lævem." Small dot-like gregarious plants growing upon wood, perennial, seated upon a crust-like spot, and resembling some species of *Lecidea*.

2401. *Hymenella*. This genus consists of plants growing upon plants, generally upon the stem, having the habit of *Sclerotium durum*, but softer, more tender, and bearing sporidia within their surface, for which reason they seem as if they consisted only of a kind of elementary *hymenium*, whence their name.

2402. *Nematelia*. From *νημα*, gelatine, and *ελεω*, to envelop, on account of the nucleus, which is of various figures, enclosed in the receptacle.

2403. *Acrospermum*. Minute fungi of a rigid habit, parasites upon decaying vegetables. From *ακρος*, the summit, and *σπερμα*, seed, on account of the apex of the plants becoming tumid, and emitting the sporules.

2404. *Sclerotium*. From *σκληρος*, hard, in allusion to the remarkably firm substance of the species. All the species are parasites upon other plants, and some are very destructive.

History, Use, Propagation, Culture,

2405. *Rhizoctonia*. Subterraneous fungi, reposing upon the roots of living plants, which they destroy. The species appear in the summer or autumn, and are very destructive. They have received their name from their habits; *εἶσα*, a root, and *κτενω*, to destroy. They are very nearly related to the subterraneous *Sclerotia*. *R. crocorum* grows parasitically on the roots of the cultivated Saffron, *Crocus sativus*, in France, and is so pernicious as to have acquired the name of *la mort du safran*. It is very destructive, soon causing the bulb to perish, and spreading with great rapidity over a whole field of that valuable crop, if not speedily stopped by a trench fifteen to eighteen inches deep, to cut off the communication between the infected and the sound plants. The smallest quantity of earth from an infected field is said to be capable of communicating this plague, even if the ground were not planted with saffron till twenty years afterwards. "Hitherto this destructive parasite has not been heard of but in France. The plants are of an irregular knobbed figure, from half an inch to an inch long, of a light reddish brown, scarcely bursting; granular and paler within. Long branching capillary roots are sent out in all directions, propagating the plants very extensively and readily by offsets which attach themselves to the saffron, and multiplying in the substance of the bulbs soon destroy them." (*Smith*.)

2446. *Periola*. From *περι*, about, and *ιολος*, hairiness, in allusion to the appearance the species exhibit when growing upon the roots of plants, or decaying fungi.

- 16309 Gregarious roundish but very irregular tuberculose orange-yellow within and without or whitish
 16310 Depressed epiphyllous scattered or very confluent reddish fulvous
 16311 Minute on both sides of the leaf numerous dark mostly angular and subconfluent
 16312 Black very minute roundish or oval numerous depressed
 16313 Epiphyllous orbicul. flattened at length somew. concave in middle fixed ben. by a central filamentous point
 16314 Minute somewhat scattered or partially aggregate very black orbicular depressed
 16315 Deep-black oval or elongated cornucous at length substrate or rugose white within
 16316 Roundish or oval confluent corneous externally and black paler within and concave
 16317 Epiphyllous scattered globular or subdepressed smooth pale at length black, Substance very corneous
 16318 Rounded or oblong sometimes confluent white at length brown or black corneous externally, within somewhat hollow and carose

16319 Rufous, Filaments few spreading over the bulb in the form of a disk

16320 Round deformed downy white

16321 Horn-like cylindrical powdery and purple-black outside, white inside

- 16322 Very minute on both surfaces of the leaf, Filaments forming a dense whitish web
 16323 On both sides of the leaf very globular nearly black, Filaments giving the leaf a farinose aspect
 16324 On both sides of leaf form. circular pulverul. spots at length conflu. Filam. dichotom. at their extremities
 16325 Red-brown minute, Filaments spreading over the whole leaf pulverulent
 16326 On the under-surface scattered very visible blackish, Filaments few simple not rendering the leaf whitish
 16327 On the upper-surface finely pulverulent, Receptacles minute congregated here and there
 16328 On the under-surface thickly covering the whole leaf, Filam. simple graniferous: bodies pyriform small
 16329 On both sides of the leaf forming a light pulverulent surface, Recept. few scattered distinct
 16330 On under-surface very numer. min. Filam. few forming no filament, or pulverul. appear. to the naked eye
 16331 On both sides of the leaf so crowded as to darken its color, Filaments very long and slender
 16332 On the under-surface scattered at length concave, Filaments elongated interwoven
 16333 On both sides the leaf very numerous scattered minute, Filaments presenting a glaucous powdery surface
 16334 On both sides the leaf scattered becoming confluent pulverulent, Recept. aggregated here and there
 16335 Chiefly on under-surface partially scatter. Filam. long flexu. Granulifer. cells oval contain. mostly 4 gran.

GASTEROMYCETES.

Class I. ANOGASTRES. — Division 1. *Phalloideæ.*

- 16336 Volva large, Stipes very cellulose white, Cells of the head containing a fetid dull-green sporiferous slime
 16337 Head close to the stipes ovate warted impervious pink

16338 Stipes cylindrical straight mucilaginous

Division II. *Tuberacæ.*

- 16339 Very rough with warts blackish
 16340 Very rough with warts whitish

and Miscellaneous Particulars.

2407. *Acinula*. Very similar to *Sclerotium* or *Perola*; but distinguished by the diffuent coat, containing a nucleus resembling an *acinus* in a berry, whence the name. A. Clavus is the Ergot of corn.

2408. *Erysibe*. A Greek name of mildew. Most of the productions arranged under this head are known by the popular name of mildew. They are better characterized by the plants on which they grow, than by their peculiar differences, which, it is probable, depend very much upon the former circumstance.

2409. *Phallus*. Large terrestrial fungi, sometimes growing upon rotten wood, not clustered, appearing in the summer after thunder-storms, fetid, and highly poisonous. Their form is so similar to that of the *φαλλος* of the Greeks, as not to be overlooked.

2410. *Balarrea*. So named by Persoon, in honor of Antonio Batarra, professor of botany in the Lyceum at Rimini, and author of a *Historia Fungorum Agri Ariminensis*, published at Faenza, in 1759, in quarto, with forty plates. A very curious plant found only in England, where, however, it is exceeding rare. The volva or wrapper is about the size of a hen's egg, originally of three slightly coraceous layers, hollow internally, when a spongy stalk is formed which rises suddenly to its full height of about twelve inches. This stalk carries up on its summit full half the innermost layer of the volva, which is white and smooth within, and covered externally with copious brown spores intermixed with fibres.

2411. *Tuber*. An ancient Roman name. *T. cibarium* is the famous truffle, so celebrated in the annals of

History, Use, Propagation, Culture.

cookery. Dogs are taught to find this fungus by the smell, and to scratch it up out of the earth. An instance is recorded of a man having possessed this power. It is brought to table either simply boiled, or stewed in various forms. It is reported to have a stimulating aphrodisiacal quality, which perhaps renders them more popular than their flavor, which is trifling. Truffles are found under the surface of the ground in various parts of Europe, where the soil is light and dry; as well as in Japan and the East Indies. There are said to be numerous varieties of color.

2412. *Rhizopogon.* Large or middle-sized Fungi, emerging from the earth, and resembling potatoes; scarcely eatable; but, according to Gleditsch, possessing aphrodisiacal qualities. On the outside covered with netted corymbose rooting fibres, whence the name, from *ρίζα*, a root, and *πωγων*, a beard.

2413. *Nidularia.* A diminution of *nidus*, a nest. The plants consist of a leathery cup containing several lenticular bodies supposed to contain sporules, and all together resembling a bird's-nest with eggs.

2414. *Myriococcum.* From *μυρίος*, a thousand, and *κόκκος*, a little capsule. Related to *Sclerotium*. The only species consists of superficial deformed confluent tubercles, 2-4-lines broad, at first sight resembling a white compound *Sphaeria* with prominent brown orifices.

2415. *Polyangium.* Named by Link, from *πόλος*, many, and *αγγιον*, a capsule. Easily distinguished from the last by the internal grumous substance, which Nees and Fries consider unequal sporidia.

2416. *Atractobolus.* From *ατρακτος*, a spindle, and *βόλλω*, to cast. The bladder which contains the sporules, is fusiform and closed, and is ejected from the base of the cupule as soon as the operculum is thrown off.

2417. *Thelebolus.* From *θηλα*, a nipple, and *βόλλω*, to emit. The uterus protrudes a globose papilliform vesicle. This is found on the dung of swine, after rainy weather in June and July. Tode compares it to the

16341 Round somewhat rugose whitish-brown slightly fibrous at base

Division III. *Nidulariaceæ*.

16342 Obconical hirsute bright-brown striated inside

16343 Campanulate villous cinereous-brown lead-colored and shining inside

16344 Campanulate-cylindrical truncate at each end somewhat downy ochrey-brown smooth and pale-yellow inside

16345 Tubercles superficial deformed confluent, at first sight resembling some kind of compound spheria

16346 About the size of a grain of sand

Division IV. *Carpobolæ*.

16347 Resembling to the naked eye flour scattered about

16348 Subglobose saffron-color gregarious sessile

16349 Stem-like receptacle inflated upwards (rarely filiform) Pointed capitular vesicle round depressed black
 ♂ Stem-like receptacle globose, Stipes oblong filiform, Capitular vesicle dot-like black

16350 Globose pale-yellow, Orifice regular stellate toothed

Class II. PYRENOAMYCETES. — Division I. *Sphariacci*.

16351 Gregarious branched compressed black white and farinaceous towards the apex downy at the base

16352 Gregarious somewhat tufted black, Peduncles glabrous more or less united at their base, Receptacle cylindrical terminated by a sterile acuminate apex

16353 Black gregar. simp. or divid. Pedunc. pass. into a ventric. recept. contain. spherules ben. its whole surface

16354 Stipes elongat. cylindr. equal somewhat flexuose, Recept. smooth roundish-ovate brown, Spherules obl. pale

16355 Fleishy, Head globose fuscous, Stipes thin very long

16356 Fleishy, Head ovate globose brown, Stipes yellow becoming blackish

16357 Fleishy soft, Head clavate pale tan-color confluent with the stipes

16358 Corky simple and branch. compressed at first whitish powdery afterwards naked and black, Stipes villous

♂ Smaller simple, Head distinct cylindrical conical acuminate

16359 Stipitate turbin. Disk truncate white dotted with black blackish externally

and Miscellaneous Particulars.

roe of a fish in appearance, and to poppy-seed in size. The color is a tawny yellow. Each individual is globular, attached at the bottom by capillary roots, and crowned by a small papillary tubercle of a more orange or golden hue than the rest.

2413. *Pilobolus*. Named from $\pi\iota\lambda\omicron\varsigma$, a cap, and $\beta\alpha\lambda\lambda\omega$. A very natural genus, consisting of gregarious little fungi, of a very fugacious nature, inhabiting dung, appearing in the summer and autumn; when full grown they resemble species of *Mucor*, but in a younger state they are more evidently interwoven, and resemble *Sphæria* or *Sclerotium*.

2419. *Sphaerobolus*. From $\sigma\phi\alpha\iota\alpha$, a globe, and $\beta\alpha\lambda\lambda\omega$. The peridium is double, membranous inside, at length becoming elastically inverted, and emitting a globose solid sporangium, filled with sporidia clustered in the centre. Epiphytous persistent plants, generally appearing in the autumn. *S. stellatus* is found in various parts of Europe in autumn upon rotten wood or branches of trees, heaps of sawdust, or in the tan-pits of hothouses. In an early state each plant consists of a pale yellow globe larger than a mustard seed. Several such grow crowded in patches, bound down as it were by a fine cottony web. After a while each plant bursts into several starr; rays, and by a momentary explosion, projects to the distance of six or eight inches a whitish globular mass of powdery seeds from its internal cavity. Sometimes this ball of seeds remains sticking to the points of the rays. When fallen to a distance, the skin of this ball is found empty, the seeds having flown out, in its passage, through a hole in its base. (Smith.)

2420. *Xylaria*. From $\chi\lambda\omicron\varsigma$, wood, in allusion to their station, or to their woody and durable texture. Once included in *Sphæria*.

History, Use, Propagation, Culture,

2421. *Stromatosphaeria*. From *stroma*, a layer of bed, and *sphaeria*, a globe, in allusion to the imbedded character of the species. Apparently well divided by Dr. Greville from *Sphaeria*.

2422. *Cucurbitaria*. So named in reference to the form of the sporules, which resemble little flasks. *Sphaeria*

* *Receptacle free, not bursting through bark.*

- 16370 Large black somewhat hemispherical, Surface smooth, Orifices of the spherules scarcely at all raised within composed of regular concentric strata
 16371 Large pale and carose at length brownish-black and rigid spreading thick undulato-rugose: the surface dotted with raised points
 16372 Brown hemispher. depress. somew. conflu. when crowd. interior of same col. Spher. very slightly promin.
 16373 Black thickish undulato-rugose whitish within, Mouths of the spherules round and somewhat prominent
 16374 Black gregarious forming linear or oblong striæ smooth, Spherules very minute without obvious mouths
 16375 Black irregular mostly free but sometimes bursting through the bark spreading confluent thickish-green within, Mouths of the spherules obtuse granulated prominent
 16376 Globose purplish-red shining black within, Spherules in circumference with more or less promin. orifices

** *Receptacle bursting through bark.*

a. *Orifices of the spherules plane, or slightly prominent.*

- 16377 Black plane spread. transversely on branch, smooth: inside whitish, Mouths of spherules not prominent
 16378 Black plane spreading longitudinally white within, Mouths of the spherules somewhat prominent conical
 16379 Black plane widely spreading somewhat rugose at first subdistinct at length confluent and united by a kind of irregular crust, Mouths of the spherules conical and angular
 16370 Grey-black scattered plano-conv. round. parasitic on elm leaves, Surface papill. with mouths of spherules
 16371 Scattered distinct very gregarious round elevated plane dark-brown dotted with the orifices of the spherules, Orifices nearly plane
 16372 Scatter. broadly thin, Perithecia immers. scatter. cover. with a dark membran. crust, Orifices burst. forth
 16373 Scattered gregarious rather large elliptical rusty-brown smooth minutely pulverulent blackish and friable within, Mouths of the spherules quite concealed
 16374 Short of a determinate figure emerging dark, Perithecia somewhat ovate, Orifices obtuse-unequal
 16375 Rather small roundish elliptical dull-black bursting transversely through the bark depressed rugose-sulcate, Surface minutely rough with the mouths of the spherules
 16376 Innate-immersed effused smooth black, Perithecia ovate immersed, Orifices prominent somew. depressed
 16377 Gregar. distinct bursting through the bark which is marked with a narrow black ring, Disk small covered by an evanescent membr. ben. white pulverul. dott. with the black orifices of the immersed spherules
 16378 Thickish purplish-brown black within covered with a min. pulverul. substance, Spher. conceal. Spor. oval

b. *Orifices of the spherules more or less spinous.*

- 16379 Scattered very gregarious somewhat conical roundish: the disk pulverulent white, Orifices of the spherules somewhat prominent and converging
 16380 Deep black bursting transversely through the bark oblong elevated, Orifices of the spherules crowded level-topped acutely 4-sided and grooved
 16381 Black round much elevated very gregarious: the orifices thick irregular 4-sided
 16382 Black gregarious sometimes subconfluent bursting transversely through the bark ferruginous within, Orifices of spherules erect straight cylindrical spinose
 16383 Receptacle very small black, Spherules few crowded with thickish cylindrical elongated obtuse coarctate orifices umbilicate at their apex and piercing the bark
 16384 Black ellipt.obl. burst. longitudin. through the bark, Spher. seat. on recept. crowd. rugose somew. tessellat.
 16385 Clustered, Spherules globose dotted red at length black at first immersed in the receptacle, Tubes containing the sporules attenuated at each extremity
 16386 Very gregarious, Spherules minute clustered scarlet oval irregular in size smooth: the mouth papilliform
 16387 Dull pale-red scattered or crowded on the receptacle, Spherules globose tuberculated and rugose
 16388 Black, Stroma very long, Perithecia at first immersed at length sessile crowded globose, Orifice papilliform with a circular depression around it

* *Spherules collected into circular clusters.*

- 16389 Black, Spherules few: the mouths elongated rough converging
 16390 Black spherules aggregated forming a dense circle, Mouths filiform flexuose converging depressed
 16391 Innate grow. on both sides, Leaf arrayed in round spots flat black, Perith. convex promin. becom. bossed

** *Spherules more or less scattered, or simply aggregated.*

a. *Spherules with an orifice.*

- 16392 Spherules few aggregated globose black: the orifice suberect filiform shining style-like
 16393 Gregar. burst. forth, Perithecia glob. nearly separate fine black becom. ragged and cup-shap. Orifice smp.
 16394 Black shining very numerous ovate conical: the mouth short thick cylindrical piercing the epidermis like a black point, After the decay of the epidermis the spherules are naked
 16395 Scattered, Perithecia prominent convex smooth black, Orifice open white
 16396 Spherules black minute very numerous globose white within immersed in the substance of the bark: the mouth very short scarcely piercing the epidermis which seems covered with innumerable dots
 16397 Upon leaves, Perithecia innate prominent punctiform globose black clustered in unequal spots
 16398 Minute scattered, Spherules depressed: the mouth very short not exerted, Epidermis of the leaf convex and slightly ruptured, Sporules naked extremely minute

and Miscellaneous Particulars.

Cuceroitula of Tode, seems to have afforded the type of the genus, which contains most of the species constituting the seventh section of Spharia in Persoon's system.

2423. *Cryptosphaeria*. A genus formed by Dr. Greville, to include those plants formerly referred to *Spharia*,

History, Use, Propagation, Culture,

which are destitute of a receptacle and remain concealed (*κεκρυπτος*, hidden, whence the name) beneath the epidermis of vegetables, which is only perforated by their mouths. They are further characterized by having their spherules not enclosed in filiform tubes as in true Sphæria.

- 1639 Black roundish oblong scattered bursting through the epidermis, Orifice irregular papillose [minute
 1640 Scattered rather min. plano-convex black, split. Epider. in centre and becom. umbilicat. Spor. naked very
 1641 Scattered, Perithecia immersed globose black concealed, Orifices dilated naked hemispherical
 1642 Scattered black shining plane: the margin slightly raised; the epidermis united with the plant and
 bursting at the centre into 3-5 acute segments, Sporules naked oblong in 3-5 distinct masses
 1643 Gregarious often crowded, Spherules yellowish globose somewhat fleshy, Orifices short cylindrical sur-
 rounded by an orange web
 1644 Somew. innate parallel confu. shin. black burst. with paral. slits, Thallus black, Perith. in rows connate
 1645 Scattered, Perithecia immersed globose, Orifices min. convex peeping out of a black spot becom. bossed
 1646 Gregarious, Perithecia somewhat immersed ovate black, Orifice bursting conical acute
 1647 Gregarious, Perithecia covered ovate black, Orifices bursting equal smooth longer
 1648 Scattered under the epidermis which is very convex and ruptured in the centre, Mouth very short obtuse
 not exerted, Sporules oval in filiform tubes
 1649 Scattered globose with a very short rounded umbilicated mouth: at first the mouth only visible at length
 the spherule itself semi-exserted falling out in decay and leaving a cavity
 16410 Spherules minute scattered very numerous black round depress. Orifice papilliform piercing the epidermis
 like minute dots at length naked when it decays
 16411 Spherules excessively minute scattered forming dark greyish cloud-like longitudinal spots on the smooth
 stalks of plants: the orifice somewhat acute penetrating the epidermis

b. Spherules without an evident orifice.

- 16412 Parasitic on the leaves of dead grasses scattered brown black white within flat hemispherical: the apex
 furnished with a tuft of black rigid diverging hairs
 16413 Scattered or in small groups minute blackish roundish producing pale spots on the leaf
 16414 Scattered very gregarious fructiform somewhat shining rarely dehiscent
 16415 Excessively minute very gregarious so as to form dark cloud-like irregular spots on the leaf
 16416 Spherules very numerous punctiform glaucous or blueish-black rendering the leaf pale
 16417 Bursting forth lin. black with hardly any thallus, Perithecia in 1 or 2 rows somew. connate black inside
 16418 Gregar. confu. cover. with a blackened epider. Perith. deform. black: disk finally burst. forth and opaque

16419 Forming nearly equidistant spots upon the stems of large dead herbaceous plants, Very common

** Spherules with an orifice, not hairy.*

- 16420 Black globose nearly smooth crowded: the orifice minute slightly papilliform
 16421 Fine red min. smooth gregar. glob. with a very min. papill. orifice, Spher. at length collapsed and concave
 16422 Black scattered gregarious roundish ovate acute shining: the mouth papilliform
 16423 Subregar. or scattered sessile orange-colored smooth glob. destitute of orifice whit. and filament. at base
 16424 Perithecia gloh. subimmers. Orifices promin. convex furnish. with an effused filament. strat. of a yell. color
 16425 Globose deformed brownish-black banded within with concentric layers, Perithecia oblong immersed
 16426 Convex pulvinate fuscous whole-colored inside, Perithecia globose, Orifices bossed
 16427 Effused thin flattened black, Perithecia subglobose prominent pimpled
 16428 Dark, Layer diffused branched, Perithecia oblong smooth pimpled
 16429 Elliptical smooth black white inside, Perithecia immersed ovate without orifice
 16430 Of a regular figure very flat contigu. dark extern. and internally, Perith. immers. ov. Orif. glob. promin.
 16431 Orbic. conv. separ. Layer white, Perithecia min. Orifices numer. disengaged glob. and rostell. somew. rug.
 16432 Pustular, Layer adhering to the bark and emerging, Disk palish, Orifices exerted oval and rostellate
 16433 Perithecia subovate, Orifices long thickened at end united in an opaque disk bursting transversely
 16434 Minute circinate, Perithecia about 6 ovate and converging, Orifices round somewhat tapering emerging
 16435 Cæspitose growing to the surface, Perithecia stalked ovate acute smooth dark
 16436 Gregarious soft, Perithecia globose smooth somew. pimpled orange-red becoming concave by collapsio

- 16437 Scattered soft very small, Perithecia ovate smooth pimpled crimson
 16438 Dark, Perithecia thin globose smooth, Orifice papilliform
 16439 Black shining, Perithecia globose rigid smooth, Orifice papilliform
 16440 Sess. min. soft aggregated or scattered smooth blood-red, Perithecia subglob. collapsing, Orifice papilliform

*** Spherules with an orifice, hairy.*

- 16441 Rather large brownish-black shining globose with a papilliform orifice arising from a dense brown
 filamentous stratum which sometimes partly envelops the spherules
 16442 Gregarious somewhat clustered quite black, Spherules roundish ovate somewhat tuberculate with short
 rigid scattered hairs, Orifice obtuse
 16443 Spherules minute crowded roundish: when young appearing like one mass of diverging brown hairs at
 length almost naked towards the apex and black, Orifice minute papilliform
 16444 Black gregar. hemispher. minutely granulat.: the apex naked somew. shin.; the base hairy, Orif. papill.
 16445 Gregar. very crowd. ov. somew. acum. orange, Orifice indist. but the spherules escape in a pulverul. form
 16446 Gregarious rose-colored, Spherules ovato-globose subacute or papillose placed on a paler colored web

and Miscellaneous Particulars.

2424. *Heterosphaeria*. From *Irigoen*, various, and *Sphaeria*; but we do not know in allusion to what peculiarity. A small black dot-like plant.

2125. *Sphaeria*. In allusion to the spherical figure of the species, which are exceedingly numerous and diff.

History, Use, Propagation, Culture,

cult of determination. Most of them are highly curious objects when minutely examined, and some even beautiful. *Sphaeria militaris* is a fine species, about an inch in height, the head being ovate, of a beautiful scarlet, granulated like orange-peel.

2426. *Lophium*. So named from *λοφος*, a little elevation. Differs from *Sphaeria* in being completely evolved, dehiscent, compressed, without a veil, and having a nucleus crumbling to powder. The plants are very similar to the valves of a bivalved shell.

2427. *Sph. sphaeræna*. From *σφαῖρα*, a sphere, and *ναιμα*, gelatine, in allusion to the round mucous bag in which the sporules are enclosed. The species are minute innate plants, generally growing on wood, very permanent, and often cohering by their base.

2428. *Septaria*. Growing upon dead leaves, in the form of clouds or spots. Named upon account of the septa of the sporidia.

2429. *Cytispora*. From *κυστις*, a little chest, and *σπορα*, a sporule. The species are very common, growing upon plants, immersed, soft, bearing fruit during damp weather, and even by watering only, within doors. The most essential character consists not in the cirrhi, common to many fungi, but in the deformed cellular perithecia, by which it may be easily known in any state.

- 16447 Perithecia *somew. ov.* rather wart. black cover. with strigose hairs of same col. Orifice rather lengthened
 ♀ Perithecia numerous seated on a little strigose villous crustaceous stalk
 *** Spherules without an evident orifice.
- 16448 Gregarious obovate deep-black smooth tuberculated
 16449 Spher. minute solitary or *somew.* cluster. black ovate setoso-rugose mouthless, Spor. ovate in cylindr. tubes
 16450 Minute black scattered globose very rugose and tuberculated parasitic on the pileus of *Polyporus abietinus*
 16451 Scatter Perith. ellipt. rounded depress. plaited lengthwise opaque black, Orifice hidden *somew.* compress.
 16452 Spher. black min. very numer. crowded roundish *somew.* tuberculated and often with a transverse furrow
 16453 Emerging prominent irregular brownish-black rufous brown internally, Orifices concealed
 16454 Tufted innate on the surface, Perithecia subglobose solid without orifice at first villous afterwards naked
 16455 Naked more or less crowd. ovate-glob. black shining, Perith. very small smooth at first without an orifice
 16456 Minute black scattered globose very warty, Parasitic on the cap of *Polyporus abietinus*
 16457 Perithecia subglobose ovate tuberculate black covered with scattered hairs of the same color
- 16458 Stipit. compress. black transverse, striat. dilat. gradual. from stipes into an elongat. wedge-shap. peritheci.
 16459 Somewhat stalked dilated upwards striated across shining

Division II. *Cytisiorci.*

- 16460 Perithecia conico-subulate acute yellowish somewhat pellicid, Globule very pale
 16461 Spherules aggregated, Sporidia 3 or 4 times divided, Cirrhi often becoming effused
 16462 Cells impressed on the receptacle, Disk emerging blackish, Cirrhi yellow [with a cottony margin
 16463 Sporulifer. tendr. white simp. Spher. waved: when divid. horizontal. manifest under epider. Orifice black.
 16464 One or many-celled convex brownish-black somewhat umbonate in the centre
 16465 Generally many-celled roundish flat brownish-testaceous, Orifices obsolete

Division III. *Phacidiacei.*

- 16466 Long, surrounding the culms whitish becoming dark-yellow at length rendered granular by the orifices
 16467 Epiphyll. round. conflu. convex cinereous-black: internally black with white cells, Orifices like granulat.
 16468 Epiphyllous subgregarious hemispherical smooth shining very black white within
 16469 On both sides of the leaf regularly scattered roundish black shining collapsed rugose and plaited
 16470 Plane orange-red, Sporules unequal globose
 16471 Plane pale fulvous
 16472 Epiphyllous somewhat angular and irregular in form subconfluent tuberculose black shining black within
 the cellules white
 16473 Minute innate on the surface rugose plaited opening with many flexuose cracks
 16474 Orbicul. subhemispher. depressed black debiscent in numer. acute segm. Disk pale greenish or yellowish
 16475 Four-sided small black or whitish spots on the leaf splitting in 4-5 acute segments, Disk dingy

- 16476 Subimmersed crowded parallel linear black, Lips of the orifice tumid smooth, Disk linear
 16477 Collected on pale defined spots roundish elliptical black: the margin depressed and paler

and Miscellaneous Particulars.

240. *Phoma*. Said by its author to be named in allusion to the pustular appearance of the plants, which are of a brownish color, and grow within the substance of leaves.
 241. *Dothidea*. A genus which has been named from *δοθιον*, a tubercle, and *ιδος*, similar, and appears to be very distinct. The species are numerous, growing upon plants; many of them are innate and dark, a few colored.
 242. *Rhytisma*. From *ῥυτις*, a wrinkle. *R. corrugatum*, the Lichen graniformis of English botany, is a gregarious, subcorneous, shining flatish plant, referred to Lichens by Acharius, but considered by Fries and Ehrenberg to belong to Fungi. It is common upon the crusts of Lichens and upon dry wood.
 243. *Phacidium*. A name with the same meaning as *Dothidea*; from *φακίς*, and *ιδος*. Intermediate between *Rhytisma* and *Hysterium*, but differing from both in the manner of dehiscence. The species are somewhat innate, epiphytous, tolerably permanent, blackish, and with a kernel which becomes softish.
 244. *Hysterium*. From *ὑστέρωσις*, penury, in allusion, perhaps, to the diseased and squalid appearance which trees attacked by this fungus assume. Minute plants, resembling *Opegrapha*, and like that genus, found occupying the bark of trees; but destitute of a crust.

History, Use, Propagation, Culture,

2435. *Actinothyrium*. So called from *ακτιν*, a ray, and *θυρον*, to enclose, in allusion to the radiated integument of the sporidia. The only known species is innate, growing upon plants, orbicular, almost black, and appearing in the early part of the year.

2436. *Leptostroma*. From *λεπτες*, thin or delicate, and *στρομα*, a layer, in allusion to the disk, which, when the perithecium separates, becomes naked and very thin.

2437. *Xyloma*. From *ξύλον*, wood, and *λωμα*, a margin. The species are innate coated tubercles, of a hard vesicular substance, but which does not produce fructification. One of the most common kinds, *X. acerinum*, has a ragged border.

2438. *Lasiobotrys*. From *λασιος*, wool, and *στρομα*, a bunch. This plant originates beneath the epidermis of the leaf, during its green and living state. When mature, it is of a very black color, and regular circular form, from one to two lines in breadth, very slightly convex, the surface uniformly granulated, and the whole generally situated on a paler or colorless portion of the leaf. On the bursting or laceration of the epidermis of the leaf, which takes place in the centre, our plant is found to consist of a multitude of distinct perithecia of a roundish form, closely arranged side by side, destitute of orifice, and the summits of which produce a granulated appearance to the naked eye or a small magnifier. These perithecia are fixed to the leaf by a number of short filaments radiating from their base, and are not to be detached without some

- 16478 Ellipt. or obl. atten. each end black somew. thin. obscure. striat. Sum. of sporulifer. cells obtuse. club-shap.
 16479 Innate scattered elliptical obtuse rather tumid smooth naked black with a longitudinal depression
 16480 Minute black irregularly gregarious oval or roundish convex, Sporuliferous tubes club-shaped
 16481 Gregarious black oblong or roundish-elliptical obtuse somewat striate
 16482 Convex tumid oblong-elliptical very black disposed in a subconcentric manner, Sporules large obl. yellow
 16483 Bursting through the bark oblong elliptical flexuose somewat ventricose greyish-brown
 16484 Gregarious linear narrow parallel smooth of dull black
 16485 Minute oval elliptical very black disposed in a subconcentric manner, Sporules large oblong yellow
 16486 Very min. oval thin. somew. plane growing longitudinally on leaf, Sporulifer. tubes clavate acum. at apex
 16487 Very minute linear elliptical black mostly on the ribs of the leaf or culm

Division IV. *Xylomacci*.

- 16488 Scattered or gregarious orbicular $\frac{1}{4}$ to $\frac{1}{2}$ line broad, very dark a little ribbed and elevated in the centre
 16489 Orbicular opaque bossed in the centre at length entirely separating, Disk whitish
 16490 Black spreading in large irregular spots which are either uniform or composed of somewhat distinct dots dehiscence irregular and rugose
 16491 Large irregular very thick black white within
 16492 Gregarious sometimes crowded roundish slightly convex brown at length blackish
 16493 Gregarious rarely scattered over the whole surface flattish irregular smooth dull-brown
 16494 Scattered black unequal in size plane: the surface rugose and somewat papillose in the centre
 16495 Minute crowded often in circular groups round black shining plane rugose
 16496 Minute roundish regularly scattered black shining smooth: the upper half separating
 16497 Clustered orbicular black becoming open, Margin erect somewat crenate, Disk pale
 16498 Perithecia even much crowded black: the radiating fibres simple
 16499 Filam. black radiat. subdichotom. at length covered with confluent rugoso-plicate shining black tubercles
 16500 Filam. very min. extremely fine branch. at length subdist. black, Tubercles producing a pale spot on leaf

Class III. TRICHOSPERMI. — Division I. *Lycopodiini*.

- 16501 Stipes short somewat fibrous, Peridium scabrous always closed, Sporules ovate
 16502 Stipes smoothish, Peridium globose, Orifice flat
 16503 Large gregarious subglobose yellowish-brown, Scales small numerous, Stipes subelongated incrassated below lacunose and variously divided at the root
 16504 Globose subdepressed very firm smooth or warty sess. or with a very short thick stipes, Root scarcely any
 16505 Middle-sized roundish long-rooted pale lemon-color obsolete scaly, Scales thickish
 16506 Gregarious smaller somewat spotted smooth brown, Root hard fibrous

and Miscellaneous Particulars.

force. Their surface is smooth black. Within they are replete with a somewat gelatinous granulose mass, containing subglobose sporidia. The above is a description of the usual appearance of this plant.

A variety, however, occurs in the form of a ring or annulus, the centre being unoccupied. Sometimes the perithecia are scattered in irregular groups, a few together, and may even occur solitary.

2430. *Asteroma*. So called from *ἀστρον*, a star, and *μακρῶς*, to be born, in allusion to the singular circumstance referred to this genus are believed to be merely young states of various kinds of Dothidea; some are the black lines by which certain Pyrenomycetes are bounded; others are merely darkened veins of leaves. To this the whole of Actinonema of Persoon, and several of his Capillarias are to be referred.

2440. *Ongyena*. So called from *ὄνυξ*, a hoof, and *γενναίαι*, to be born, in allusion to the singular circumstance of the original and only species being always found on old horse-hoofs in shady woolly places.

2441. *Tulostoma*. From *τὺλος*, a wart, and *στόμα*, the mouth, in reference to the nature of the orifice by which the seeds of this plant are dispersed. *T. brumale* is found on the mossy tops of walls about London in the winter and spring. It may easily be overlooked for some unexpanded Agaric.

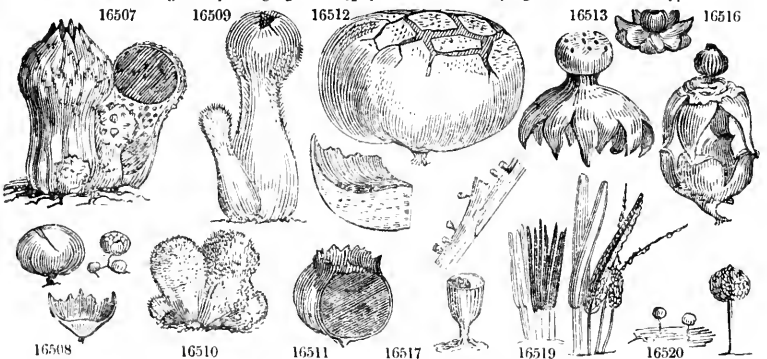

2442. *Scleroderma*. So called from *σκληρός*, hard, and *δέρμα*, skin, in allusion to the hardness of the coat of the species. *S. spadiceum* is found on heaths in England, but is very rare; it is about the size of a chestnut, rather depressed at the top.

History, Use, Propagation, Culture,

2443. *Lycoperdon*. So called by Tournefort, from *λυκος*, a wolf, and *πεδω*, to explode backwards, that author certainly having improved upon the foolish old name, *Crepitus lupi*, by making it less generally intelligible. (*Smith.*) These are roundish tuber-like plants, when ripe, exploding and emitting the spores in the form of smoke, whence country people call the species puff-balls.

2444. *Bovista*. A name of barbarous origin, having been formed by Dillenius, from the German *Bovist*. *Bovista furfuracea*, an Italian species, is said by Micheli, to be common on heaths near Florence, where it is sold with others of its tribe, by an article of food. *Bovista gigantea* is the largest of the genus, and, indeed, of the whole order, measuring not unfrequently nearly 2 feet in diameter. Bulliard mentions having seen many of eighteen, twenty, and twenty-three inches in diameter, and on the authority of others, affirms them to attain the enormous bulk of nearly nine feet in circumference. The flesh is at first white, afterwards of a greenish-yellow, lastly of a brown-grey. The outer peridium cracks and peels off in large flakes on being handled.

2445. *Geastrum*. So called from *γασ*, the earth, and *αστρος*, a star, in allusion to the stellate appearance of the species when burst and lying on the ground. A genus formed by Micheli upon the Puff-balls with a stellated volva.

2446. *Craterium*. So named from *κερας*, a cup, in allusion to the form of the peridium, which in *C. vulgare* is formed like a small goblet. This is a minute subsolitary plant, with the habit of *Calicium*.

- 16507 Large obconical soft whitish plicate beneath, Scales broad often indistinct
- 16508 White soft hemispherical subsessile somewhat smooth, Warts scattered
- 16509 Large white variable, Peridium subglob. cover. with spatul. warts, Stipes somew. smooth long and plicate
- 16510 Caspit. pyrif. umbon. pale-brown, Scales in form of min. slender spin. process. Root consist. of long fibres

- 16511 Large white becoming blackish-brown plicate beneath
- 16512 Almost sessile very large globular yellowish-white, with scattered nearly obsolete scales

- 16513 Volva multifid, Peduncles and oscula of the peridium numerous
- 16514 Smaller, Head flat above, Orifice acuminate with longer cilie
- 16515 Peridium globose stalked, Orifice hoary, Radii somewhat quadrifid arched
- 16516 Volva multifid spreading, Laciniae equal, Head depressed spherical sessile, Orifice acuminate

Division II. *Trichoesti.*

- 16517 Cup-shap. redd.-brown, Operculum convex whit. very thin evanescent, Filam. white, Sporules very dark
- 16518 Campanulate chesnut-color, Operculum firm white, Stipes orange, Sporules blackish

- 16519 Crowded cylindrical, Stipes black arising from a shining subjacent membrane, Peridia very fugacious blackish-brown, Stipes continued to the summit of the peridium
- 16520 Dark-brown globose stipitate, Stipes penetrating through the summit of the peridium

- 16521 Gregarious roundish, Stipes short blackish

- 16522 Gregar. brownish-purple nodding umbilicated, Membrane of peridium deciduous, Flocci persistent robust

- 16523 Gregarious often caspitose stipitate dull crimson, Sporules abundant crimson-red

- 16524 Pale-yellow substipitate cylindrical long weak drooping

- 16525 Yellow globose stipitate, Peridium splitting into holes which are beautifully expanded and reflexed
- 16526 Sporangium sess. Peridium splitting into many regular reflexed segm. Colum. very min. Spor. pedicellat

- 16527 Effused forming an irregular sort of reticulation yellowish or pale-brown
- 16528 Crowded obovate ochrey-yellow bursting at the summit
- 16529 Shortly stipitate reddish at length yellowish bursting at the apex plicate beneath

- 16530 Sessile subglobose smooth greyish-white: both of the peridia fragile, Sporules globular

- 16531 Head globose flattish beneath grey inclined, Stipes rather long pale weak sulcate, Sporules dark-brown
- 16532 Head glob. flatt. ben. blueish-grey nodd. Stipes thin weak whit. not furrow. Spor. and flam. dark-brown
- 16533 Head globose dark-grey, Stipes long firm black, Sporules and filaments very dark
- 16534 Subglob. umbilicate ben. yellowish-green, Stipes slender rather weak brown. Sporules and flam. very dark
- 16535 Head globose depressed pale-glaucous, Stipes very short thick pale at length brownish
- 16536 Peridium subglobose fine yellow. Stipes slender rather long greyish-brown, Sporules globose

and Miscellaneous Particulars.

2447. *Stemonitis*. From *στέμον*, a stamen, in allusion to the form of some of the species, which may be compared to the male organ of a flower, taking the stipes for the filament, and the head for the anthera.

2448. *Cribraria*. A genus formed by Schrader out of the *Spharocarci* of Bulliard. It has for its essential character, a peridium, the upper part of which has numerous apertures, whence the name, from *cribro*, to perforate. All the species are found in autumn upon rotten wood.

2449. *Dictydium*. From *δικτυον*, a net, and *ιδος*, similar; the peridium appears like net-work fastened together by minute delicate ribs. Very minute pinheaded plants, with the appearance of *Calicium*.

2450. *Arsycyria*. From *αρεξυς*, a net. The sporules are fastened together by a net-work of fibres. Beautiful little minute fungi, found upon wood.

2451. *Leangium*. From *λειος*, smooth, and *αγγειος*, a vessel, in reference to the smoothness of the peridium. Small wart-like plants, resembling a minute *Lycoperdon*.

2452. *Trichia*. From *τριχης* *τριχος*, hair, in allusion to the internal mass of elastic fibres gradually expanding after the head bursts. These are pin-headed plants, growing upon old wood, and very rarely seen in this country.

2453. *Diderma*. From *δις*, double, and *δερμα*, a skin, on account of the double peridium.

2454. *Physarum*. So named, on account of the bladdery appearance of the peridium, from *φυσσα*, a vesicle.

History, Use, Propagation, Culture,

2455. *Leocarpus*. A word with the same meaning as *Leangium*; which see. *L. vernicosus* appears as if varnished over with vermilion. The plants grow in clusters upon bits of rotten wood, and are each formed of a pear-shaped stalked peridium, bursting at the end, and letting fall out a nucleus of sporules held together by fibres.

2456. *Lycogala*. From *λυκος*, a wolf, and *γαλα*, milk, a genus of fungi whose internal appearance and substance in an early state are like a mass of thick cream. It is included under *Mucor* by *Linnaeus*, *Schreber*, and others. *L. argenteum* is found upon rotten wood in the autumn. It is about an inch or more in diameter, brown and pulpy when young, of a brilliant white when arrived at maturity, discharging, by one or more irregular accidental openings, a mass of rich dark snuff-colored powder.

2457. *Spumaria*. From *spuma*, froth. *S. mucilago* is spread in the autumn over the leaves and stems of living plants, or over dead branches, when it resembles in some measure stiffened foam or froth.

2458. *Dichosporium*. From *διζαα*, double, and *σπορα*, a seed; in allusion, we presume, to the double coat of the peridium, the innermost of which is formed of granules like sporules. The only species known is found upon the bark of the oak.

2459. *Licca*. The meaning of this word is unexplained. The species have been referred to *Trichia*, *Didy-*

16537 Shortly stipitate obovate reddish-brown shining crowded, Stipes whitish

Division III. *Fuliginoides*.

16538 Globular gregarious red changing to brown, Sporules orange-red at length purple-grey

16539 Large suboval very fragile silvery-white, Sporules profuse deep-brown, Filaments few

16540 Minute white roundish depressed rarely confluent fragile, Sporules black intermixed with a few filaments

16541 Effused frothy, Peridium furnished internally with horn-like grey processes inclosing brown sporules

Division IV. *Licoidei*.

16542 The only species

16543 Gregarious sessile yellowish or chestnut-brown subglobose: the upper half of the peridium separating like a lid, Sporules rarely mixed with one or two filaments

16544 Peridia cylindrical very fragile densely crowded forming a roundish or hemispherical mass dull-red changing to pale-brown, Sporules brown in the form of minute abundant dust

Class IV. *Mucoroides*.

16545 Byssus-like white becoming yellowish, Stipes erect or lax simple bearing a minute subglobose head

16546 Filaments branched whorled, Peridium elevated

16547 Stipes simple, Heads inflated spherical dark-grey bursting close to the stipes which is long and filiform

Class V. *Perisporia*.

16548 Gregarious punctiform yellow, Filaments whitish branched

16549 Tufted, Peridia gregar. greenish covered by the filam. which are elongat. simple profuse somew. erect in [centre

16550 Changes from yellow to grey

HYPHOMYCETES.

Class I. *Cephalotrichi*.

16552 Growing in small tufts, Filaments subconfluent simple or branched and fasciculated

and *Miscellaneous Particulars.*

mium, &c. by various writers. They are minute productions scarcely bigger than pins' heads, found chiefly on rotten wood of the fir kind.

2460. *Mucor*. An alteration of $\mu\kappa\upsilon\tau\iota\varsigma$, the name of a small fungus. To this genus are referable the greater part of the substances which form the mould upon cheese and other materials.

2461. *Thamnidium*. From $\theta\alpha\mu\iota\delta\iota\varsigma$, a rod or twig, in allusion to the appearance of the plants under the microscope. Minute plants, with a bushy branched stipes, and a head like that of *Mucor*

2462. *Ascophora*. From $\alpha\sigma\chi\omicron\phi\omicron\varsigma$, a term used by mycologists to denote a peculiar kind of receptacle or sporules, and $\phi\omicron\iota\sigma\mu\alpha$, to bear. These are pin-headed fungi, with the habit of *Mucor*, from which they chiefly differ in their peridium being turned inside out after bursting, and being somewhat persistent.

2463. *Eurotium*. $\epsilon\upsilon\tau\omicron\iota\omicron\varsigma$ was the Greek name of a sort of mouldiness, and has been with a sufficient reason applied to this genus of plants.

2464. *Amphisporium*. From $\alpha\mu\phi\iota$, double, and $\sigma\sigma\omicron\phi\omicron\alpha$, a sporule. These organs are or two $\tau\omicron\upsilon\alpha\iota\varsigma$, either roundish with three dots in the middle, or ovate acuminate, and quite pellucid.

2465. *Ceratium*. So named from $\kappa\epsilon\iota\tau\alpha\iota$, a horn, on account of the cornute appearance of the plants under a microscope.

*History, Use, Propagation, Culture,*

2466. *Isaria*. From *ισος*, equal, on account, perhaps, of the equality which exists among the filaments of the plants both in size and length.

2467. *Stilbum*. From *στίζω*, shining. The species are all found upon old rotten wood, and are at first watery or gelatinous, but become opaque and turbid as they ripen.

2468. *Torula*. A diminutive of *thorus* or *torus*, a bed. This plant forms a thick compact bed or layer upon the plants on which it grows.

2469. *Monilia*. From *μονή*, a necklace, with reference to the peculiar manner in which the filaments are articulated.

2470. *Racodium*. *Ρακίον* was the name among the Greeks for a worthless worn-out ragged garment; and has been applied to the present genus, in allusion to the dirty interwoven cloth-like substance with which it clothes whatever it grows upon. *Racellare* is the black substance which overruns the bottles of the wine merchant, and which often hangs in long thick festoons from the sides and roof of his cellars.

2471. *Dematium*. A diminutive of *δέμα*, a bundle or parcel. The filamentous thallus is often collected into bundles.

2472. *Cladosporium*. From *κλαδος*, a branch, because the sporules are attached to the branches of the fungi.

2473. *Helicosporium*. From *ἑλιξ*, a spiral, in allusion to the manner in which the sporules are curved.

16552 Extremely minute scattered simple club-shaped very white, Filaments and sporidia indistinct

Class II. STILBOIDEI.

16553 Head roundish whitish semifluid becoming firmer and yellowish, Stipes rather thick cylindrical

Class III. INOMYCETES. — Division I. *Byssaci*.

16554 Filaments densely crowded so as to form a black crust

16555 Tufted gold color

16556 Very soft lax much interwoven of a greenish black color, Filaments intermixed with irregular granules

16557 Minute blackish fascicled, Bristles diverging sometimes jointed

16558 Tufted extremely minute of an olive-green color becoming blackish and rigid in old age

16559 Very minute spreading on old wool in wide velvety patches greenish-black, Filaments simple or branched jointed somewhat thickened upwards

16560 The only species

16561 Very irregular rigid diverging: when young from a common centre; afterwards straggling, Filaments tawny orange-color compressed of various sizes

16562 Compressed brown or black shining anastomising often broad and very extensive [regularly patent

16563 Stem pale redd. cylind. subflex. never anastomis. Branches spread. in all directions free, Fructific. clavate

16564 Stems covered with a mealy substance

16565 Long branched roundish somewhat separate black

16566 Round much branched snow-white, cellular and yellow inside

Division II. *Mucedines*.

16567 Spreading widely within putrefying *Agarici* and *Boleti*, Filam. white, Spor. profuse bright orange-yellow

16568 Filaments spreading branched olive-brown, Pedicels of the sporules numerous alternate

16569 Forming a pulverulent hoariness interspersed with very minute tufts, Filaments few branched straggling, Sporules large obtusely oval

16570 Tufts roundish minute very white, Filaments loosely entangled, Sporules very numerous oval

16571 Tufts yellow irregular roundish, Filaments lax entangled, Sporules numerous subglobose

16572 Tufts of a reddish orange-color, Filaments very slender much entangled, Sporules glob. extremely minute

16573 Differs from the last, chiefly in its paler color

16574 Very white forming a web, Filam. dense, y interwoven very fine, Sporules globular scattered very minute

and Miscellaneous Particulars.

2474. *Ozonium*. We presume, from $\omega\zeta\omicron\varsigma$, a branch, in allusion to the manner in which the filaments branch or diverge from a common centre. This genus has been extracted from Dematium by Link.

2475. *Rhizomorpha*. So called from its resemblance to the branching fibrous roots of various plants. All the productions referred to this genus are very obscure and uncertain. *R. phosphorea*, the *Clavaria phosphorea* of Sowerby, is a plant sometimes existing as a parasite between the wood and bark of trees, or in wine-cellar among saw-dust, and is, when fresh, remarkably luminous in the dark.

2476. *Sepedonium*. From $\sigma\eta\pi\iota\delta\omega\varsigma$, putrescence. The species grow among the decaying parts of fungi, and other putrid substances.

2477. *Acremonium*. From $\alpha\kappa\epsilon\tau\iota\mu\omega\varsigma$, a branch; the thecae are produced about the filaments in fascicles, as branches are about trees.

2478. *Sporotrichum*. From $\sigma\pi\omicron\tau\omicron\varsigma$, and $\tau\tau\epsilon\zeta$, hair, in allusion to the filamentous nature of the sporules. A very destructive parasite in some seasons, and probably of general distribution, for it has been detected on a great variety of plants. To gardeners it is well known as a kind of mildew or blight, and is commonly taken for an insect. The leaves of the peach-trees, even when protected by glass, are often attacked by it, nor does the fruit itself always escape, in which case it frequently drops off. The leaves are more or less distorted by it. As its production is probably the result of a peculiar state of the atmosphere, there is little chance of any means being discovered for its prevention.

History, Use, Propagation, Culture,

2479. *Trichothecium*. The thecae are intermixed among a mass of hair-like filaments; whence the name.
 2480. *Acrosporium*. From *akros*, the top of any thing, and *σπορα*, a spore; the latter occupying the summit of the simple filaments.
 2481. *Botrytis*. So called from *βοτρυς*, a bunch of grapes, in allusion to the clusters of little globular seeds or seed vessels.
 2482. *Aspergillus*. This is the name of the brush with which the holy-water is scattered in Catholic ceremonies. The little plant, consisting of a stem and a cluster of sporules at the top, is not unlike a little brush with its handle.
 2483. *Stachyidium*. From *σταχυς*, a spike, and *ειδος*, similar. The sporules are dispersed in a sort of spiked manner on the filaments.

- 16575 Tufted, Tufts distinct at length sometimes confluent, Filam. white, Sporules pink very numerous oval
 16576 Filaments simple forming white spots of one or two lines in length on the living leaves of grasses
 16577 Filam. branched somew. fasciculated erect in spreading tufts white at first at length a fine glauc. color
 16578 Very lax tuft. white branch. Branch. few long spread. set with short patent ramuli bear. round clust. of spor.
 16579 Tufted confluent white, Filaments one line high, Branches divaricate, Sporules numerous ovate large
 16580 Pale purpl.-grey spread. Filam. branch. towards summit, Branch. divaric. short, Spor. large oval numerous
 16581 Somewhat tufted lax white not much branched, Sporules roundish
 16582 Tuft. min. formed of white erect filaments with little heads at first white but when mature of a glauc. color
 16583 In dense tufts composed of whitish or yellowish suberect entangled filaments with yellowish heads
 16584 Tufts rather dense, Filaments entangled suberect heads as well as the filaments greenish
 16585 Filaments scattered gregarious about a line high supporting an elongated tuft of beaded sporidia
 16586 Filaments branched erect remotely jointed scattered white, Sporules globular
 16587 Barren filaments effused interwoven: fertile ones simple somewhat scattered, Heads of sporules white
 16588 Densely tufted spreading, Heads of sporules at length glaucous

- 16589 Tufted, Tufts roundish composed of snow-white interwoven filaments, Sporules profuse green at length giving the whole a green-color

Class IV. PHYLLOPERIDACEÆ.

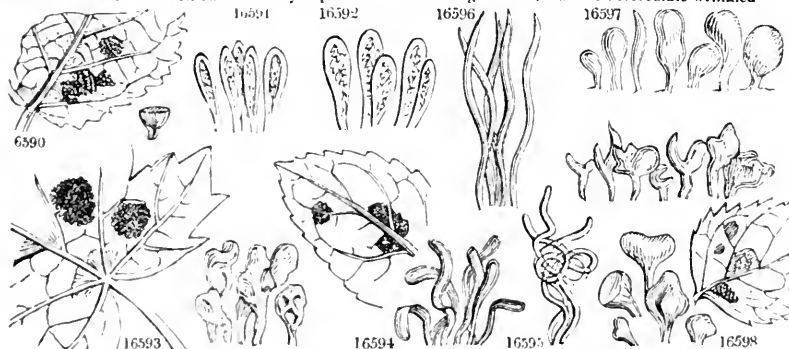

- 16590 Irregularly tufted or effused and confluent whitish at length reddish-brown, Peridia shortly branched, Branches thick bearing several round or ovate lobes
 16591 On the surface of the leaf bright gold-color effused sometimes spreading over the whole leaf, Peridia simple crowded club-shaped, Sporules evident excessively minute yellow
 16592 Hypophyllous, so minute as scarcely to be raised above the surface of the leaf pale obscure purple widely effused, Peridia simple obtusely club-shaped
 16593 On the under surface of the leaf depressed distinct or confluent pale becoming reddish-brown, Peridia club-shaped very rarely turbinate flaccid, the upper half often inclined
 16594 Mostly on the under surface of the leaf scattered subeffused rich reddish-brown, Peridia compressed lin. somewhat lax with the apex club-shaped and often truncate
 16595 Mostly on the under surface irregularly tufted whitish becoming ferruginous, Peridia linear cylindrical twisted with rounded summits
 16596 Hypophyll. silky or toment. pale or quadrangular, Peridia erect cylindric. long and attenuated to a point
 16597 On the under surface whitish-pink becoming subferruginous rarely in the form of spots or tufts but confluent at the margin of the leaf which is rolled inwards and conceals it, Peridia short
 16598 Mostly on the upper surface unequally scattered confluent fine crimson, Peridia polymorphous turbinate club-shaped or capitate, the summit frequently truncate
 16599 Mostly on the under surface whitish at length dark ferruginous often confluent, Peridia short polymorphous sometimes turbinate but generally with two blunt horn-like patent summits

CONIOMYCETES.

Class I. TUBERCULARÆ.

- 16600 Gregarious deep-red rugose furnished with a very short thick pale stipes

- 16601 Gregarious confluent depressed flesh-red small somewhat plane
 16602 Somewhat round somewhat shortly stipitate dull-red at length black. Surface tuberculate wrinkled

and Miscellaneous Particulars.

2484. *Penicillium*. A name with the same meaning as *Aspergillus*, to which genus this is extremely similar in appearance.

2485. *Trichoderma*. From *τριχος*, hair, and *δημα*, a coat. The threads to which the sporules are attached spread round, radiating through the powdery mass in little tufts from a subjacent membrane.

2486. *Rubigo*. An ancient Latin name of blight. There was a inferior deity whom the Romans acknowledged under the name of *Rubigus*, and whom they propitiated in bad seasons. All the productions referred hither are popularly called mildew or blight.

2487. *Erineum*. So named in reference to its hispid appearance, which resembles the common hedge-hog, *Erinaceus*. Found growing upon leaves in little tufts.

2488. *Tubercularia*. So named in allusion to its warted appearance

*History, Use, Propagation, Culture,*

2489. *Fusarium*. The sporules are remarkable for their regular fusiform figure.

2490. *Exosporium*. So called by Link, from $\xi\varsigma$, on the outside, and $\sigma\sigma\epsilon\omicron\varsigma$, a sporule; on account of their external situation. Entire plant about one-third of a line in diameter, rarely larger, very gregarious, deep black, convex, bursting from beneath the epidermis, and appearing bristly under a pocket magnifier. Sporidia very crowded, elongated, obtuse at the apex, subopaque, divided transversely about five times, fixed at the base upon a roundish dark-colored, solid receptacle, and there persistent.

2491. *Fusidium*. A name with the same meaning as *Fusarium*.

2492. *Polythrincium*. From $\pi\omicron\lambda\omicron\varsigma$, many, and $\theta\epsilon\iota\gamma\mu\omicron\varsigma$, a little division. To the naked eye, this little plant appears in the form of numerous minute black spots of unequal size. Under the microscope, these spots are each found to consist of a number of distinct little roundish tufts of filaments, nearly equidistant from one another, and becoming smaller towards the circumference. The filaments are densely crowded, semitransparent, gradually thickening upwards, somewhat moniliform from the numerous articulations, erect, simple; the sporidia oval, two-celled, scattered among the filaments.

2493. *Stilbospora*. From $\sigma\tau\iota\lambda\beta\omicron\varsigma$, to shine, and $\sigma\sigma\epsilon\omicron\varsigma$, a sporule. Asci or sporules naked, imbedded in a black substance flowing from the branches of trees.

16603 Minute roundish or oval subgelatinous, Sporules long slender slightly curved

16604 Gregarious black minute convex, Sporidia elongated obtuse about 5 times transversely divided

Class II. ENTOPHYTÆ. — Division I. *Stilbosporæ*.

16605 Mass thin irregular of a whitish or grey color

16606 Mass irregular thin bright-yellow or greenish

16607 The only species

16608 Heaps rather large, Sporidia extremely minute nearly equally 2-celled

16609 Black granulated irregularly ovate at length shapeless, Sporules ovate attenuated at each extremity

16610 Heaps small, Sporidia ovate unilocular

16611 Heaps roundish bursting through the bark, Sporules ovate obtuse 2-celled

16612 Black very crowded, Filaments linear-oblong 4 or 5 times divided

16613 Spherules depressed black immersed, Sporules large ovate escaping in the form of thick black tendrils

16614 Spherules very small grey black, Sporules excessively minute dust-like under a high magnifying power escaping in the form of long capillary entangled dull-orange tendrils

16615 Spherules waved when divided horizontally elevating the epidermis, Orifice blackish with a cottony margin, Sporules very minute forming a single short slightly tortuous whitish tendrils

Division II. *Hypodermis*.

16616 The only species

16617 Hypophyllous scattered dark fuscous round very pulverulent sometimes confluent, Sporidia globose

16618 Aggregated deep-brown chiefly hypophyllous confluent, Sporidia oval sometimes with a very min. stipes

16619 Hypophyllous scattered becoming confluent reddish or purplish-brown, Sporidia globose greenish under a high power of the microscope

16620 Hypophyllous circular scattered rarely disposed in a circle round a pale-brown centre, Sporidia globular

16621 Hypophyllous scattered single or disposed in a circle round a central one light-brown, Sporidia globular subovoid and rarely furnished with a minute pedicel

16622 On both sides of leaf dark fuscous minute round scattered, Sporidia globular rarely with a minute pedicel

16623 Hypophyllous scattered sometimes subconfluent roundish light-brown girt by the remains of epidermis, Sporidia oviform sometimes furnished with a very short blunt pedicel

16624 On both surfaces of the leaf and opposite to each other scattered round light-brown girt with the remains of the epidermis, Sporidia globose

16625 On both surfaces of the leaf brown round minute often not bursting: the epidermis rarely disposed in a circle, Sporidia ovoid sometimes with minute pedicels

16626 Scattered round depressed light-brown girt with the remains of the epidermis, Sporidia rounded or suboval rarely with minute pedicels

16627 Hypophyllous pale yellowish-brown sometimes disposed in a circle round: a central one minute rarely confluent, Sporidia roundish or egg-shaped and rather hyaline

16628 Hypophyllous scattered or partially aggregated reddish-brown rounded somewhat prominent minute very unequal, Sporidia roundish or oval rarely pedicelled

16629 On both sides of the leaf scattered distinct oblong reddish-brown girt by the ruptured epidermis, Sporidia subglobose rarely subpedicelled

and Miscellaneous Particulars.

2494. *Sporidermium*. From *σπορος*, a spore, and *δερμα*, a skin, or coat. A plant of a very simple structure, composed entirely of linear-oblong or club-shaped semi-opaque bodies, closely arranged side by side, exactly of the same height, and transversely divided by three or four disseppiments. When viewed with the naked eye, it resembles an intensely black thin crust, creeping over the surface of *Telephora*. Specimens from Captain Carmichael, as well as those found by Dr. Greville, occurred on *Telephora vulgaris*.

2495. *Namiospora*. From *νημα*, a thread, and *σπορα*, a spore. The species resemble distorted threads filled with minute spores.

2496. *Cylindrosporium*. In allusion to the cylindrical form of the sporules. Found on both surfaces of living cabbage leaves (*Brassica oleracea*). Frequent in May and June. A very extraordinary plant, forming minute speck-like heaps of an oblong shape, but otherwise very irregular, and projecting into little angles and processes. They are disposed in a concentric manner, are pure white, and change in decay to a dirty yellow. Sporules naked, very numerous, cylindrical, truncate at each extremity, pellucid.

2497. *Uredo*. An old Latin name, from *uro*, to burn or scorch, applied to those occasional discolorations of the surfaces of plants which were attributed to blasts or injuries of the atmosphere or heavenly bodies, and are

History, Use, Propagation, Culture,

called mildew or blight. All the species are obscure and require further examination. They are in the hands of Bauer, whose knowledge and pictorial powers cannot be better employed than in illustrating this obscure part of vegetation.

- 16630 Hypophyl. scatter. very min. rounded becom. contigu. but not confluent, Sporidia pyriform subpedicellate
 16631 Hypophyl. very min. convex orbicular scattered becom. confluent, Sporidia very min. globul. transparent
 16632 Hypophyl. pale ochrey-yell. distinct at first soon bursting becom. confu. and very pulverul. Sporidia oval
 16633 Hypophyllous bright orange-yellow prominent crowded generally forming circles and becoming very confluent, Sporidia very numerous obovate
 16634 Hypophyllous orange-yellow oblong irregular becoming confluent, Sporidia numerous
 16635 Hypophyllous depressed yellow oblong concentric becoming confluent, Sporidia nearly oval
 16636 Chiefly hypophyllous golden-yellow scattered irregular convex becoming confluent, Sporidia subspherical.
 16637 Hypophyllous small scattered effused orange-yellow, Sporidia suboval sometimes with a minute pedicel
 16638 Hypophyllous golden-yellow suborbicular becoming effused, Sporidia very numerous irregularly spherical
 16639 Bright reddish-orange broad pulverulent hypophyl. and on nerves and petioles, Sporidia numer. subglob.
 16640 Epiphyllous much scattered rather large yellow thick elevated from the leaf and bursting in a glose manner, Sporidia subglobose
 16641 Hypophyl. lin. obl. crowded arranged in a subparallel manner orange-yell. becom. pale, Sporidia spherical
 16642 Hypophyllous and on the petioles and calyx oblong thickish sometimes partly disposed in a circular manner and subconfluent deep reddish-yellow, Sporidia spherical
 16643 On both sides of the leaf and stem suborbicular prominent bright orange-yellow scattered, Sporidia oval or even oblong transparent
 16644 Hypophyllous and on the calyces rather large oval with an indurated disk after the sporidia have escaped, Sporidia bright orange spherical and granular within
 16645 Hypophyllous scattered round depressed rarely confluent, Sporidia yellowish-orange spherical surrounded by the remains of the ruptured epidermis
 16646 Hypophyllous punctiform scattered or collected into small clusters golden-yellow scarcely bursting, Sporidia ovate or oblong somewhat transparent and granular within
 16647 Hypophyll. golden-yell. scatter. distin. surround. by remains of ruptur. epidermis, Sporidia subglob. minute
 16648 On both sides of the leaf oblong or lin. sometimes forming long lines yellow becoming reddish or brownish in decay, Sporidia globular or suboval
 16649 Hypophyllous and on the petioles somewhat aggregated but generally following the course of the veins, bullated yellow bursting in the centre
 16650 Chiefly hypophyllous very minute regular numerous convex late in bursting golden-yellow, Sporidia roundish oval or even oblong
 16651 Chiefly hypophyllous very minute pale-yellow subrotund convex scattered or collected into clusters scarcely bursting, Sporidia suboval
 16652 Hypophyll. depressed regular in form redd. orange scattered becoming partially confu. Sporidia egg-shaped
 16653 Hypophyllous depressed minute spreading somewhat aggregated subconfluent irregular in form of a deep orange or orange-red, Sporidia oval
 16654 Hypophyllous scattered or crowded distinct convex roundish large compared with the following mostly closed pale becoming golden-yellow, Sporidia very long obtuse at each extremity
 16655 Hypophyllous punctiform prominent or papilliform numerous tawny yellow mostly closed, Sporidia ovate
 16656 Polymorphous of various forms sometimes disposed in a circular manner quite white frequently never bursting, Sporidia in great profusion globular
 16657 Within the fruit and glumes of corn and various grasses spreading and in a short time filling the whole with a profuse black dust, which under the microscope consists of minute spherical spores
 16658 Attacking the fructification of Carices and forming a black compact slightly pulverulent mass composed of a pale solid nucleus surrounded by the naked sporidia which are small and globular
 16659 Always inclosed within the grain and filling it with uniform dense fetid blackish-brown mass composed of very minute spherical sporidia
 16660 Attack. anth. and ovary of the *Caryophylleae*, fine purp. Spori. very plentiful pulverul. min. and globul.
 16661 Sporidia very min. purpl.-brown plentiful produc. within florets and often filling them with pulverul. mass

- 16662 Large oblong or conical much scattered pale-orange bursting with an irregular orifice, Sporidia excessively abundant bright-orange
 16663 Hypophyllous numerous distinct, Sporidia very white toothed, Teeth beautifully rolled back brittle and vanishing, Sporidia pinkish-orange
 16664 Hypophyllous and on the petioles scattered or subaggregated numerous, Peridia whitish split into many small deciduous teeth, Sporidia orange becoming obscure brown
 16665 Hypophyllous and on the petioles scattered distinct, Peridia very white split into a few comparatively large teeth, Sporidia yellowish-white. Surface of the leaf blistered whitish
 16666 Hypophyllous very numerous subsessile scattered or collected into little clusters, Peridia white split into subrevolute teeth, Sporidia fine orange
 16667 Hypophyllous, Peridia distinct but decidedly clustered and crowded prominent becoming subelongated; the mouth with a few broad very delicate deciduous teeth, Sporidia fine orange
 16668 Hypophyllous and on the petioles irregularly clustered and deforming the parts on which it grows, Peridia somewhat indistinct round prominent and yellowish with a subterre orifice

and Miscellaneous Particulars.

1698. *Acidium*. These plants are found upon the leaves of other vegetables, and one of them is known to agriculturists under the name of Red Gum. This species usually grows inside the glumes of the calyx, under the epidermis, which, when the plant is ripe, bursts and emits a powder of a bright orange color. It does not

History, Use, Propagation, Culture,

appear to be materially injurious to the grain, if at all. Ears full of it have been found with very plump grains; and it has also been found upon branched ears. Before the cuticle which covers the fungus bursts, it has much the appearance of a pustule upon the human body.

- 16669 Hypophyllous at first prominent pustular soon becoming agglomerated very numerous, Peridia splitting into short brittle yellowish-white teeth, Sporidia pale-orange
- 16670 Hypophyllous in widely scattered agglomerated clusters but not very crowded, Peridia subsessile split into very white exceedingly brittle teeth, Sporidia pale
- 16671 Hypophyllous and on the petioles and stem, Peridia campanulate agglomerated rarely single split into many short recurved teeth, Sporidia ochre-yellow numerous ovate
- 16672 Hypophyllous and on the petioles, Peridia in dense agglomerated clusters whitish split into revolute teeth, Sporidia yellowish: the leaf whitish around the clusters
- 16673 Hypophyllous upon a thickened portion of the leaf, which on the upper surface is of a fine red color with a yellow border, Peridia densely crowded splitting into yellowish-white teeth, Sporidia pale
- 16674 Hypophyllous, Peridia agglomerated in scattered clusters of various sizes whitish with a brittle dentated margin, Sporidia yellow
- 16675 Hypophyllous and on the petioles aggregated short somewhat campanulate with numerous very minute marginal teeth, Sporidia bright-orange subglobose or oval
- 16676 Hypophyllous and on the fruitstalk, seed-vessel, calyx, and even petals, Peridia short or elongated cylindrical densely crowded fine orange, Sporidia yellow under the microscope
- 16677 Hypophyllous and on the petioles and young fruit, Peridia elongated agglomerated brown splitting to the base in capillary segments, Sporidia numerous light-brown
- 16678 Hypophyllous, Peridia 2-12 long cylindrical slightly curved yellowish-brown springing from an orange-colored thickened portion of the leaf, Sporidia numerous greyish becoming brown
- 16679 Hypophyllous marked on the upper surface of the leaf by a yellow or purplish spot, Peridia partly immersed short splitting into white revolute teeth, Sporidia pink-orange
- 16680 Hypophyllous producing a crimson spot on the upper surface of the leaf, Peridia minute subimmersed splitting regularly into small revolute white teeth, Sporidia yellowish-white
- 16681 Hypophyllous marked by a pale spot on the upper surface of the leaf and a pale ring round the peridia, which are small not numerous splitting into small brittle yellowish-white teeth, Sporidia pale
- 16682 Hypophyllous somewhat clustered, Clusters of a roundish form, Peridia oblongo-cylindrical bright-orange, Mouth paler and bursting irregularly
- 16683 Hypophyllous, Sporidia mucronated 5-7-celled with a white filiform stipes incrassated towards the base which is furnished with a yellow gland
- 16684 Hypophyllous deep-black tufted, Sporidia 4-celled obtuse mucronate, Stipes slender incrassated at the base
- 16685 Hypophyllous tufted of various sizes black rather lax scattered, Sporidia 7-9-celled somewhat attenuated mucronate with a slender stipes incrassated at the base
- 16686 Somewhat tufted scattered black, Sporidia cylindrical 3-4-celled obtuse never mucronated, Stipes filiform
- 16687 Round, or ov. obl scatter. black somewhat convex, Sporidia densely crowded obl. obt. firmly fix. by pedicels
- 16688 Hypophyll. deep pinkish-brown promin. consist. of a number of distinct aggregat. tufts, Sporidia obl. acute
- 16689 Hypophyllous small of various sizes few together and confluent pale-brown, Sporidia long somewhat waved much attenuated at each extremity with an elongated stipes
- 16690 Hypophyllous punctiform minutely tufted subrotund blackish-brown, Sporidia crowded obtusely egg-shaped with a long flexuose filiform pedicel
- 16691 Chiefly hypophyllous minute aggregated rendering the nerves and petioles swollen dark bluish-grey before bursting, Sporidia nearly black oval not contracted in the centre, Stipes short
- 16692 Hypophyllous and on the petioles conglomerated confluent brownish-grey before bursting, Sporidia nearly black obtuse scarcely contracted in the centre: the upper cell sometimes divided
- 16693 Hypophyllous round scattered nearly black, Sporidia of an obtuse irregular figure with a short filiform stipes somewhat incrassated at the base
- 16694 Hypophyllous minute round very crowded reddish-brown: upper cell of the sporidia thick globose; the lower one long and narrow, Stipes short
- 16695 On both sides of the leaf and on the stem in small nearly black scattered tufts surrounded by the remains of the ruptured epidermis, Sporidia oval the two cells nearly equal, Stipes very short
- 16696 Hypophyllous minute very dark scattered, Sporidia short with both cells obtuse and a short stipes
- 16697 Hypophyllous circular very variable in size blackish-brown scattered rarely confluent, Sporidia very obtuse with a subelongated stipes
- 16698 On both sides of the leaf in minute tufts nearly black circular bordered by the remains of the epidermis, Sporidia variable very obtuse rounded 2-celled both often subdivided, Stipes very short
- 16699 Hypophyllous blackish-brown irregular in figure girt by ferruginous remains of epidermis, Sporidia crowded obtuse divided but scarcely contracted in the middle, Stipes short
- 16700 Hypophyllous scattered closely over the whole surface small round brown depressed, Sporidia much contracted in the centre nearly resembling figure 8: the upper cell largest
- 16701 Hypophyllous very thickly scattered and becoming contiguous but very rarely confluent minute at first and ferruginous after bursting, Sporidia short: upper cell obtuse, Stipes very short
- 16702 Hypophyllous dark-brown scattered or sub-confluent often concentric, Sporidia crowded pulverulent obtusely oval slightly contracted in the middle: the lower cell terminating in an abrupt and short stipes
- 16703 On the leaf and petiole crowded confluent, Sporidia dark-brown pulverulent: upper cell obtuse, Stipes somewhat lengthened

and Miscellaneous Particulars.

2490. *Puccinia*. A name of obscure meaning; possibly derived from *pūca*, closely packed, in allusion to the crowded manner in which the little plants are placed. *P. graminis* is a plant too well known to the farmer under the name of blight. It attacks the stem and leaves of corn, at first having the appearance of orange-

History, Use, Propagation, Culture,

coloured streaks, which afterwards assume a deep chocolate-brown colour. The little plants chiefly attack the parenchyma, immediately below the stomata with which the cuticle abounds. Each individual is so small, that any stoma on a straw will, according to Sir Joseph Banks, produce from twenty to forty fungi, and every one of them will, no doubt, produce at least one hundred reproductive particles; so that the progeny from a single stoma will be enough to infect a whole plant. The period of a generation is supposed not to exceed a week; and as the reproductive particles are exceedingly light, they are wafted aloft in the air, which is thus loaded with clouds of animated dust, ready upon the first favourable occasion to carry blight and disease into all the neighbourhood. The figures which illustrate this subject are copies of Mr. Bauer's illustrations of blight, published in 1805 by Sir Joseph Banks. *a* (preceding page), a piece of infected wheat stem, natural size; *b*, a highly magnified longitudinal cutting of the same; *c* to *z*, highly magnified representations of the *Puccinia gráminis* in various states; *o*, a piece of the cuticle magnified, and showing the stomata; *p*, a highly magnified transverse cutting of the straw; *q*, a magnified representation of the outside of the straw; *r*, a very highly magnified representation of a part of the same.

The alarming state of the harvest of August 1804, from what is vulgarly called blight, induced Sir Joseph Banks to have some blighted stalks of wheat examined under a powerful microscope, and drawings made from them by Mr. Francis Bauer. These were published in a pamphlet in January 1805, the object of which, as we are informed in the advertisement, was to procure "actual observations on the origin and progress of the disease" from those "intelligent agriculturists, whose residence in the country enables them daily to examine, not only the progress of their crops, but the origin and advances also of all those obstacles which nature has opposed to the success of agricultural labours, as if to awaken the energies of reason, and to reward the farmer for the exertions of his intellectual faculties, by the satisfaction of surmounting them."

As we have here a space that would otherwise be unoccupied, we cannot do better than to fill it up by transcribing the whole of the pamphlet alluded to, there being still ample room for "actual observations" on that baneful disease.

"Botanists have long known that the blight in corn is occasioned by the growth of a minute parasitic fungus or mushroom on the leaves, stems, and glumes of the living plant. Felice Fontana published, in the year 1767, an elaborate account of this mischievous weed*, with microscopic figures which give a tolerable idea of its form; more modern botanists† have given figures both of corn and of grass affected by it, but have not used high magnifying powers in their researches.

"Agriculturists do not appear to have paid, on this head, sufficient attention to the discoveries of their fellow-labourers in the field of nature; for though scarcely any English writer of note on the subject of rural economy has failed to state his opinion of the origin of this evil, no one of them has yet attributed it to the real cause, unless Mr. Kirby's excellent papers on some diseases of corn, published in the *Transactions of the Linnean Society*, are considered as agricultural essays.

"On this account it has been deemed expedient to offer, to the consideration of farmers, engravings of this destructive plant, made from the drawings of the accurate and ingenious Mr. Bauer, botanical painter to His Majesty, accompanied with his explanation, from which it is presumed an attentive reader will be able to form a correct idea of the facts intended to be represented, and a just opinion whether or not they are, as is presumed to be the case, correct and satisfactory.

"In order, however, to render Mr. Bauer's explanation more easy to be understood, it is necessary to premise, that the striped appearance of the surface of a straw, which may be seen with a common magnifying glass, is caused by alternate longitudinal partitions of the bark, the one imperforate, and the other furnished with one or two rows of pores or mouths, shut in dry, open in wet weather, and well calculated to imbibe fluid whenever the straw is damp. Pores or mouths similar in these are placed by nature on the surface of the leaves, branches, and stems of all perfect plants, a provision intended, no doubt, to compensate, in some measure, the want of locomotion in vegetables. A plant cannot when thirsty go to the brook and drink, but it can open innumerable orifices, for the reception of every degree of moisture which either falls in the shape of rain and of dew, or is separated from the mass of fluid always held in solution by the atmosphere; it seldom

and Miscellaneous Particulars.

happens in the driest season, that the night does not afford some refreshment of this kind, to restore the moisture that has been exhausted by the heats of the preceding day. By these pores, which exist also on the leaves and glumes, it is presumed that the seeds of the fungus gain admission, and at the bottom of the hollows to which they lead (*b p*) they germinate and push their minute roots, no doubt (though these have not yet been traced), into the cellular texture beyond the bark, where they draw their nourishment by intercepting the sap that was intended by nature for the nutriment of the grain; the corn, of course, becomes shrivelled in proportion as the fungi are more or less numerous on the plant; and as the kernel only is extracted from the grain, while the cortical part remains undiminished, the proportion of flour to bran, in blighted corn, is always reduced in the same degree as the corn is made light. Some corn of this year's crop will not yield a stone of flour from a sack of wheat; and it is not impossible, that in some cases the corn has been so completely robbed of its flour by the fungus, that if the proprietor should choose to incur the expense of thrashing and grinding it, bran would be the produce, with scarcely an atom of flour for each grain.

"Every species of corn, properly so called, is subject to the blight; but it is observable that spring corn is less damaged by it than winter, and rye less than wheat, probably because it is ripe and cut down before the fungus has had time to increase in any large degree. Tull says, 'that white core, or bearded white, which has its straw like a rush full of pith, is less subject to blight than lammas white, which ripens a week later.' (See page 74.) The spring wheat of Lincolnshire was not in the least shrivelled this year, though the straw was in some degree infected: the millers allowed that it was the best sample brought to market. Barley was in some places considerably spotted, but as the whole of the stem of that grain is naturally enveloped in the hose or basis of the leaf, the fungus can in no case gain admittance to the straw; it is, however, to be observed, that barley rises from the fall lighter this year than was expected from the appearance of the crop when gathered in.

"Though diligent enquiry was made during the last autumn, no information of importance relative to the origin or the progress of the blight could be obtained: this is not to be wondered at, for as no one of the persons applied to have any knowledge of the real cause of the malady, none of them could direct their curiosity in a proper channel. Now that its nature and cause have been explained, we may reasonably expect that a few years will produce an interesting collection of facts and observations, and we may hope that some progress will be made towards the very desirable attainment of either a preventive or a cure.

"It seems probable that the leaf is first infected in the spring, or early in the summer, before the corn shoots up into straw, and that the fungus is then of an orange colour; after the straw has become yellow, the fungus assumes a deep chocolate brown: each individual is so small, that every pore on a straw will produce from twenty to forty fungi, as may be seen in the plates, and every one of these will, no doubt, produce at least one hundred seeds; if then, one of these seeds tillers out into the number of plants that appear at the bottom of a pore (*b p*), how incalculably large must the increase be! A few diseased plants scattered over a field must speedily infect a whole neighbourhood, for the seeds of fungi are not much heavier than air, as every one who has trod upon a ripe puff-ball must have observed, by seeing the dust, among which is its seed, rise up and float on before him.

"How long it is before this fungus arises at puberty and scatters its seed in the wind, can only be guessed at by the analogy of others; probably the period of a generation is short, possibly not more than a week in a hot season: if so, how frequently in the latter end of the summer must the air be loaded as it were with this animated dust, ready whenever a gentle breeze, accompanied with humidity, shall give the signal, to intrude itself into the pores of thousands of acres of corn. Providence, however, careful of the creatures it has created, has benevolently provided against the too extensive multiplication of any species of being; was it otherwise, the minute plants and animals, enemies against which man has the fewest means of defence, would increase to an inordinate extent. This, however, can in no case happen, unless many predisposing causes afford their combined assistance. But for this wise and beneficent provision, the plague of slugs, the plague of mice, the plagues of grubs, wireworms, chafers, and many other creatures whose power of multiplying is countless as the sands of the sea, would long before this time have driven mankind and all the larger animals from the face of the earth.

"Though all old persons who have concerned themselves in agriculture remember the blight in corn many years, yet some have supposed that of late years it has materially increased; this, however, does not seem to be the case. Tull, in his *Horse-hoeing Husbandry*, p. 74, tells us that the year 1725 'was a year of blight, the like of which was never before heard of, and which he hopes may never happen again;' yet the average

History, Use, Propagation, Culture, and Miscellaneous Particulars.

price of wheat in the year 1726, when the harvest of 1725 was at market, was only 36s. 4d., and the average of the five years of which it makes the first, 37s. 7d.: 1797 was also a year of great blight; the price of wheat, in 1798, was 49s. 1d., and the average of the five years, from 1795 to 1799, 68s. 5d.

"The climate of the British isles is not the only one that is liable to the blight in corn; it happens occasionally in every part of Europe, and probably in all countries where corn is grown. Italy is very subject to it, and the last harvest of Sicily has been materially hurt by it. Specimens received from the colony of New South Wales show that considerable mischief was done to the wheat crop there, in the year 1803, by a parasitic plant very similar to the English one.

"It has been long admitted by farmers, though scarcely credited by botanists, that wheat in the neighbourhood of a barberry bush seldom escapes the blight. The village of Rollesby in Norfolk, where barberries abound and wheat seldom succeeds, is called by the opprobrious appellation of mildew Rollesby. Some observing men have of late attributed this very perplexing effect to the farina of the flowers of the barberry, which is in truth yellow, and resembles in some degree the appearance of the rust, or what is presumed to be the blight in its early state.

"It is, however, notorious to all botanical observers, that the leaves of the barberry are very subject to the attack of a yellow parasitic fungus, larger, but not otherwise different from the rust in corn.

"Is it not more than possible, that the parasitic fungus of the barberry and that of wheat are one and the same species, and that the seed is transferred from the barberry to the corn? Mistletoe, the parasitic plant with which we are the best acquainted, delights most to grow on the apple and hawthorn, but it flourishes occasionally on trees widely differing in their nature from both of these: in the Home Park, at Windsor, mistletoe may be seen in abundance on the lime trees planted there in avenues. If this conjecture is well founded, another year will not pass without its being confirmed by the observations of inquisitive and sagacious farmers.

"It would be presumptuous to offer any remedy for a malady, the progress of which is so little understood; conjectures, however, founded on the origin here assigned to it, may be hazarded without offence.

"It is believed, but not dogmatically asserted (because Fontana, the best writer on the subject, asserts that the yellow and dark coloured blight are different species of fungi), to begin early in the spring, and first to appear on the leaves of wheat in the form of rust, or orange-coloured powder; at this season, the fungus will, in all probability, require as many weeks for its progress from infancy to puberty as it does days during the heats of autumn; but a very few plants of wheat thus infected are quite sufficient, if the fungus is permitted to ripen its seed, to spread the malady over a field, or indeed, over a whole parish.

"The chocolate-coloured blight is little observed till the corn is approaching very nearly to ripeness; it appears then in the field in spots, which increase very rapidly in size, and are in calm weather somewhat circular, as if the disease took its origin from a central position.

"May it not happen, then, that the fungus is brought into the field in a few stalks of infected straw uncorrupted among the mass of dung laid in the ground at the time of sowing? It must be confessed, however, that the clover leys, on which no dung from the yard was used, were as much infected last autumn as the manure crops. The immense multiplication of the disease in the last season seems however to account for this; as the air was no doubt frequently charged with seed for miles together, and deposited it indiscriminately on all sorts of crops.

"It cannot, however, be an expensive precaution to search diligently in the spring for young plants of wheat infected with the disease, and carefully to extirpate them, as well as all grasses, for several are subject to this or a similar malady, which have the appearance of orange-coloured or black stripes on their leaves, or on their straw; and if experience shall prove that uncorrupted straw can carry the disease with it into the field, it will cost the farmer but little precaution to prevent any mixture of fresh straw from being carried out with his rotten dung to the field.

"In a year like the present, that offers so fair an opportunity, it will be useful to observe attentively whether cattle in the straw yard thrive better or worse on blighted or on healthy straw. That blighted straw, retaining on it the fungi that have robbed the corn of its flour, has in it more nutritious matter than clean straw which has yielded a crop of plump grain, cannot be doubted; the question is whether this nutriment in the form of fungi does or can be made to agree as well with the stomachs of the animals that consume it, as it would do in that of straw and corn.

"It cannot be improper in this place to remark, that although the seeds of wheat are rendered, by the exhausting power of the fungus, so lean and shrivelled that scarcely any flour fit for the manufacture of bread can be obtained by grinding them, these very seeds will, except, perhaps, in the very worst cases, answer the purpose of seed-corn as well as the fairest and plumpest sample that can be obtained, and in some respects better; for as a bushel of much blighted corn will contain one third at least more grains in number than a bushel of plump corn, three bushels of such corn will go as far in sowing land, as four bushels of large grain. Fifty grains of the most blasted wheat of the last year that could be obtained, were sown in pots in the hot-houses; of these, seventy-eight produced healthy plants, a loss of 10 per cent only.

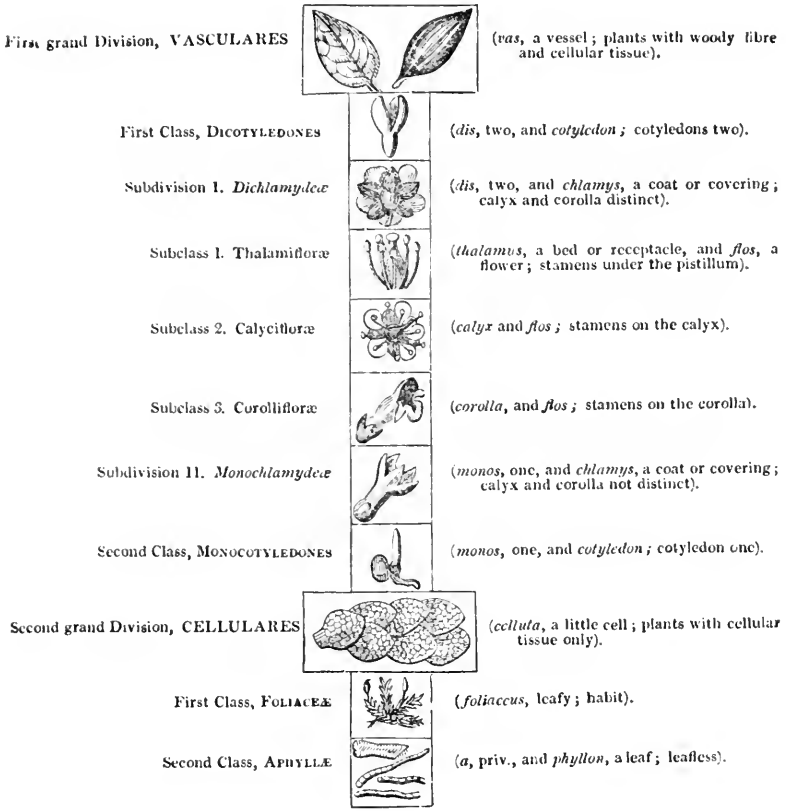

"The use of the flour of corn in furthering the process of vegetation is to nourish the minute plant from the time of its development till its roots are able to attract food from the manured earth; for this purpose, one tenth of the contents of a grain of good wheat is more than sufficient. The quantity of flour in wheat has been increased by culture and management calculated to improve its qualities for the benefit of mankind, in the same proportion as the pulp of apples and pears has been increased, by the same means, above what is found on the wildings and crabs in the hedges.

"It is customary to set aside or purchase for seed-corn, the boldest and plumpest samples that can be obtained; that is, those that contain the most flour; but this is unnecessary waste of human subsistence; the smallest grains, such as are sifted out before the wheat is carried out to market, and either consumed in the farmer's family or given to his poultry, will be found by experience to answer the purpose of propagating the sort from whence they sprung as effectually as the largest.

"Every ear of wheat is composed of a number of cups placed alternately on each piece of the straw; the lower ones contain, according to circumstances, three or four grains, nearly equal in size, but towards the top of the ear, where the quantity of nutriment is diminished by the more ample supply of those cups that are nearer the root, the third or fourth grain in a cup is frequently defrauded of its proportion, and becomes shrivelled and small. These small grains which are rejected by the miller, because they do not contain flour enough for his purpose, have, nevertheless, an ample abundance for all purposes of vegetation, and as fully partake of the sap, or blood, as we should call it in animals, of the kind which produced them, as the fairest and fullest grain that can be obtained from the bottoms of the lower cups, by the wasteful process of beating the sheaves."

ENCYCLOPÆDIA OF PLANTS.

PART II. NATURAL ARRANGEMENT.

THE difficulties connected with the adoption of the natural system of plants are these, that the characters of many of the orders are at present imperfectly known, and that they depend upon a consideration of many points of structure which are not to be determined without much labor and a considerable degree of practical skill in the use of the microscope and the dissecting knife. But the facilities which the habit of viewing all natural bodies with reference to the relations they bear to other bodies, and not as insulated individuals merely possessing certain peculiarities by which they may be referred to some station in an artificial system, ultimately gives to the investigations of the naturalist, are so great, that difficulties of the nature just alluded to ought not to be suffered to influence the botanist in determining which line of study he will follow, whether that pointed out by Linnæus, or that traced by the hand of nature. By the artificial system of Linnæus, indeed, no great difficulty exists in determining the number of stamens or styles possessed by a given plant, or the nature of their combination, and from the knowledge so obtained, in referring them to their class and order in the Linnæan system. But when this step has been gained, what more has been acquired than the bare knowledge that the plant in question possesses a certain number of stamens and styles? No possible notion can be formed of the relation it bears to other plants of the same nature, of the qualities it probably possesses, or of the structure of those parts not under examination, the fruit for example; and, finally, if it were wished to convey an idea of the plant to a stranger, no means would be in the possession of the Linnæan botanist of doing so, except by stating that the plant belonged to Pentandria Monogynia for example, which is stating nothing. But what would be the condition of the student of the natural affinities of plants in a similar case? It is true he would be obliged to consult more characters than the two unimportant ones of Linnæus — it would be necessary to ascertain if his subject was Vascular or Cellular; if Vascular, whether it was Monocotyledonous or Dicotyledonous; if Dicotyledonous, whether the leaves were opposite or

alternate, stipulate or exstipulate, whether the flowers were monopetalous, polypetalous, or apetalous, the nature and station of the stamens, the condition of the ovarium, and so on. But when he has ascertained thus much, only let it be remembered, for a moment, how much he has gained indirectly as well as directly. Perhaps he has discovered that his plant belongs to Rubiaceæ; he will then have learned that all vegetables with opposite entire stipulate leaves, and a monopetalous-superior corolla, are also Rubiaceous; if a fragment of the leaves and stem only of such a plant were afterwards submitted to him for examination, he would recognise its affinities, and remember that it was Rubiaceous, and being aware of that fact, he would be able safely to infer that its calyx and corolla would be of a particular nature, that if the roots afforded any color for dyeing, it would be red; that the medicinal properties of the bark, if any, would be tonic, astringent, and febrifugal, and that its seeds would be of the same nature as those of coffee, and finally, its geographical position would be tolerably certain to him.

The really important obstacle which exists in the way of acquiring this kind of knowledge, is undoubtedly the want of any introduction to the study of it, accompanied by the distribution and characters of the natural orders into which plants are divided. It is to be hoped that English readers at least will not long have to regret this deficiency in their elementary works. In this place, it must suffice to point out the characters upon which the great divisions depend, under which the orders themselves are arranged; and it is to be hoped, that even this small aid will be found to smooth the way, and to remove some of the obstacles that at present are supposed to exist at the very threshold of the temple.

Plants considered with reference to their general structure, are separated into two grand divisions called CELLULARES and VASCULARES.

The Cellulares answer to the Linnæan Cryptogamia, and are also called Acotyledonous; the Vasculares answer to the rest of the Linnaean system, which is sometimes called Phanerogamia and Cotyledonous.

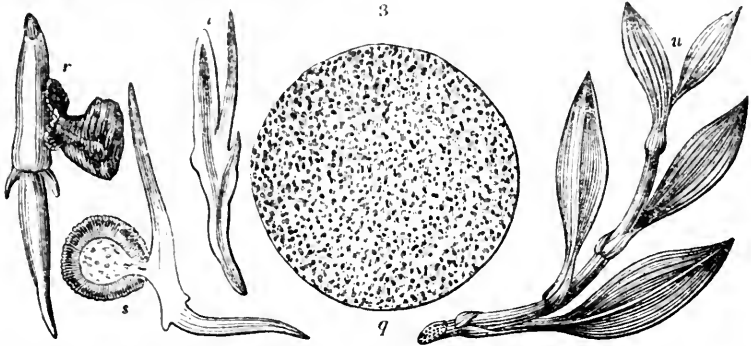

a, Longitudinal section of a stem.
 b, Transverse section of a stem.
 c, Stem of a moss, with leaves and theca, or seed-case.
 d, Leaf of a moss, magnified.
 e, Leafy thallus of a lichen, with shields.
 f, Crustaceous thallus of a lichen, with shields.
 g, Fungi of the highest dignity.
 h, i, Fungi of the lowest rank.
 k, Conferva magnified.

CELLULARES, CRYPTOGRAMOUS, or ACOTYLEDONOUS plants are all, therefore, different terms denoting the same combination of vegetables. The first term is here adopted in preference to the others as expressing the most obvious character upon which the division depends, namely, the cellular, not vascular, structure of the plants composing it. Cellular plants are formed entirely of cellular tissue (fig. 1.), without woody fibre or spiral vessels; or in more familiar terms by having no veins in their leaves if foliaceous, and not forming wood; they also are destitute of perfect flowers. The lower tribes, such as Fungi and Algae, are destitute of leaves, and in some points approach the animal kingdom so nearly as to be scarcely distinguishable. In the highest tribe, Ferns, apparent veins are formed in the leaves; but as they are imperfectly supplied with spiral vessels, they cannot be considered more than analogous to the veins of other plants. Ferns, however, hold the intermediate station between Cellulares and Vasculares, and are chiefly retained among the former on account of their perfect accordance in other respects. In the whole of Acotyledones, it is unnecessary to examine the seed for the purpose of determining whether it has one cotyledon, several cotyledons, or none; the structure of the perfect plant giving the most obvious and satisfactory evidence.

l, Vertical section of a vascular stem.
 m, Woody fibre.
 n, Spiral vessel.
 o, Leaf of a dicotyledonous plant.
 p, Leaf of a monocotyledonous plant.

VASCULARES, PHENOGAMOUS, or COTYLEDONOUS plants, are also separated into two great classes called **Endogenes or Monocotyledones,** and **Exogenes or Dicotyledones,** both which are distinguished as accurately by their obvious physical structure as they are by the minute and obscure peculiarities of the seed. They are all formed with cellular tissue, woody fibre, and spiral vessels (*fig. 2*), and their leaves are traversed by veins; the last character is sufficient for practical purposes, if it is remembered that they also bear perfect flowers, (that is, flowers furnished either with stamina, or pistillum, or both,) which will always prevent their being confounded with the highest tribes of Cellulares.

3, Transverse section of a monocotyledonous stem.
 4, Germination of a monocotyledonous seed.
 5, Section of ditto, to show the cotyledon remaining in the testa.
 6, Section of a germinating embryo of a grass, to show the two alternate cotyledons of unequal size; the back and front lobes represent these; the middle lobe is the plumula.
 7, Stem and leaves of a monocotyledonous plant.

Endogenes, or Monocotyledonous plants, are the first remove from Cellulares, and hold an intermediate rank between them and **Exogenes or Dicotyledonous plants,** in which vegetation acquires its highest form of development. They were formerly characterised by having a single cotyledon, but this circumstance is not only not absolute but difficult of determination, except after minute analysis. The real difference in the seed of them and Dicotyledones is this, that in Monocotyledones there is only one Cotyledon (*fig. 3, 4*); or, if two, that they are alternate with each other (*l*), while in Dicotyledones they are always opposite, and more than one, sometimes several, as in *Pinus* (*fig. 4, 5*). The physiological structure of the two classes is, however, that by which they are familiarly distinguished, and exhibits a beautiful proof of the harmony that exists between the great features of vegetation and their first principle, the seed from which they originate. In **Endogenes, or Monocotyledones,** there is no distinction between wood and bark (*fig. 3, 6*); in **Exogenes, or Dicotyledones,** the wood and bark are distinctly separated (*fig. 4, 5*). In Monocotyledones the wood and cellular tissue are mixed together without any distinct annual layers of the former being evident; in Dicotyledones the wood and cellular tissue have each their particular limits assigned them, a distinct layer of the former being annually deposited. In Monocotyledones there are no radiations from the medulla to the bark; in Dicotyledones the radiations are distinctly marked. In Monocotyledones there is generally no articulation between the leaves and the stem, while in Dicotyledones the leaves are always jointed with the stem from which they fall off, leaving a scar behind. In Monocotyledones the veins of the leaf pass in parallel lines from the base to the apex, in Dicotyledones they diverge from the midrib towards the margin at various angles; in the former they are unbranched, the principal veins being connected by nearly simple secondary veins; in the latter they are much branched, ramifying in many directions, and giving the surface of the leaf a netted appearance.

6, Transverse section of a dicotyledonous stem.
 7, An embryo with two cotyledons.
 8, An embryo with four cotyledons.
 9, An embryo with many cotyledons.
 10, Stem and leaves of a dicotyledonous plant.

Such are the very obvious distinctions of the two great classes of **Phænogamous, or flowering, plants;** and so far is it from there being any necessity for dissecting a seed in order to ascertain its structure, that this point is one of the most easy determination, and about which there cannot be in one case in five hundred the slightest cause of doubt or difficulty. It is almost impossible to take even a morsel of a plant in the hand without instantly being in possession of the knowledge of the structure of its seed, with respect to the cotyledons.

Thus far have we advanced without a single obstacle to impede us. In all farther investigation no greater degree of knowledge or application is requisite than what ought to be possessed by every one who would be able to ascertain the genus of a plant. Many of the orders do not depend upon the minute characters of the seed so much as is believed; the structure of the ovary and position of the ovula, are aids which frequently make amends for the absence of fruit; and the nature of the foliage and inflorescence are guides which, though sometimes treacherous, are often as faithful as the fructification itself. But as it is not intended to give the characters of the orders in this place, neither is it necessary to advance farther in an explanation of the manner of determining them; upon that point each order would require a particular note. It may, how-

ever, be confidently believed, that there are no greater impediments in the road to an acquaintance with the natural relations of plants than those that have been already removed; and that although neither the science of botany, nor any other science, is to be taken by storm, yet that the fortress is sure to be reduced by silent and patient approach.

It only remains to explain briefly upon what principles the names of the orders, suborders, &c. are formed. It is usual, in the school of Jussieu, to give to a natural order a name derived from that of the genus which is understood to be the type of the order; as Ranunculaceæ from *Ranunculus*, Rosaceæ from *Rósa*, and so on. But several deviations from this principle had been admitted by Jussieu, in favor of certain groups of plants, long known by other popular names, derived from certain peculiarities; such as Labiate, because their corollas are labiate; Compositæ, because their flowers are what is commonly called compound; Guttifera, on account of the resinous juice in which they abound, and some others. It would, perhaps, have been better, if uniformity in nomenclature had not thus been sacrificed to a dread of innovation; but it is now too late to remedy the evil, if such it be; nor would the advantage of alteration be at this day equivalent to the inconvenience. For the purpose of making it at once apparent, whether, in speaking of a group of plants, reference is had to an order or a suborder, it has of late years been thought convenient to terminate the name of the natural order in *aceæ*, and of the suborder in *ecæ*. Thus, in speaking of the whole mass of which *Ranunculus* is the representative, the word *Ranunculaceæ* is used; but in speaking of the particular division, or suborder, of which *Ranunculus* forms a part, the term *Ranunculæcæ* is employed. This manner of speaking is, however, at present, very partial in its application, and is of little importance, except in a few cases, of which *Ranunculaceæ* is one of the most striking examples. In those orders, the titles of which, necessarily, from their grammatical construction, end in *ecæ*, as *Orchidæcæ*, it is obviously inapplicable, without a total change in a great part of the nomenclature of natural orders, a measure which cannot be too much deprecated.

It may, perhaps, be finally expected, that these remarks should be concluded by a recommendation of some work, from which those who are anxious to become fully acquainted with the principles and distinguishing characters of the Natural System of Botany, may derive the necessary information. Unfortunately, however, such a work has at present no existence. M. Decandolle's *Théorie Élémentaire de la Botanique* explains the principles upon which the orders of plants are constituted; and M. de Jussieu's *Genera Plantarum* contains their characters, as determined in 1759: but the latter is now too obsolete to be very useful to the tyro. In our own language, the only work that can be consulted upon the subject with advantage, is the *Flora Scotica* of Professor Hooker, in which the characters of the natural orders of Scottish plants are concisely indicated by Mr. Lindley. We understand a work upon the subject is in preparation by the latter gentleman, by which this great desideratum in the science of Botany will be supplied. It may be expected to appear in the course of 1829, previously to which, however, the division Botany, in the forthcoming *Encyclopædia of Natural History* will have been published, in which much information may be expected upon this important subject.

I. VASCULARES.

CLASS I. DICOTYLEDONES.

SUBDIVISION I. DICHLAMYDÆ.

This subdivision comprehends all the Dicotyledonous plants, that have both a calyx and corolla, by which they are distinguished from Monochlamydæ, in which the calyx only exists. It is in consequence of this high development of the floral envelopes, that the greater part of flowering trees and shrubs are found in Dichlamydæ, it rarely happening that those with a single floral covering only have any brilliant coloring.

SUBCLASS I. THALAMIFLORÆ.

Petals inserted into the receptacle.

The insertion of the petals and stamens into the receptacle is the great character of this subclass, which, therefore, contains all the polyandrous plants of Linnæus, as the *Calycifloræ* contain the icosandrous genera of the same botanist.

Section 1. *Carpella numerous, or stamens opposite the petals.*

ORDER I. RANUNCULACEÆ.

The greater part of the plants of this order are objects of interest with gardeners, containing, as it does, many of the most elegant or showy of the tribes of hardy plants. It is here that the graceful *Clematis*, the lowly *Anemone*, the glittering *Ranunculus*, and the gaudy *Pæony* are found; differing, indeed, in external appearance, but combined by all the essential characters of the fructification. It is remarkable, however, that the acrid and venomous properties of these plants are nearly as powerful as their beauty is great. They are all caustic, and in many of them the deleterious principle is in dangerous abundance. M. Decandolle remarks, that its nature is extremely singular; it is so volatile, that, in most cases, simple drying in the air or infusion in water is sufficient to destroy it: it is neither acid nor alkaline; but its activity is increased by acids, honey, sugar, wine, or alcohol; and it is, in reality, destructible only by water. The crowfoots of our European pastures, and the *Anemones trilobata* and *triteriata*, of those of South America, are well known poisons of cattle. Blistering plasters are made in Iceland of the leaves of *Ranunculus acris*. The foliage of some species of *Clematis* is supposed to afford the means employed by beggars of producing artificial ulcers. Some of the *Aconites* are diuretic, especially *Napellus* and *Cinnamum*. *Delphinium Consolida* is said to be an ingredient in those French cosmetics which are so destructive of the surface of the skin. The *Helleborus*, famous in classical history for its drastic powers, and the *Nigella*, celebrated in ancient housewifery for its aromatic seeds, which were used for pepper before that article was discovered, are both comprehended in *Ranunculaceæ*. The range of this order, in a geographical point of view, is very extensive. A great number has been discovered in Europe, but they are so abundant in all parts of the world that an order can scarcely be found more universally and equally dispersed. It is singular, that, with the exception of the climbing species of *Clematis* and of *Xanthorhiza*, scarcely an instance occurs in *Ranunculaceæ* of a shrubby stem.

1202 *Pæónia W.*

709 *Xanthorhiza W.*

ORDER II. DILLENIACEÆ.

Fine plants, almost exclusively confined to tropical countries. *Dillenia speciosa*, a native of India, is a most noble tree with large yellow flowers, rivaling those of a *Magnolia*. *Hibbertia volubilis* is a green-house plant well known for the beauty of its blossoms, and their powerfully fetid smell. The medical properties of this order are scarcely known; a decoction of their leaves or bark is astringent, and used for gargles; and the acid juice of the fruit of some of the species of *Dillenia* is used in India, mixed with water, as a pleasant beverage in fevers. The foliage of many of the species is extremely scabrous, whence the dried leaves are used for the same purposes as fish-skin and sand-paper in Europe; those of *Trachytella aspera* are even employed in China for polishing works of metal.

1201 *Curatella W.*
1212 *Tetracera L.*

1206 *Trachytella Dec.*
1214 *Dillenia W.*

1203 *Hibbertia H. K.*
1211 *Colbertia Sal.*

ORDER III. MAGNOLIACEÆ.

No one is ignorant of the grandeur of *Magnolias*, or of the delicious, though sometimes dangerous, fragrance of their blossoms; but it is less generally known, that, from their affinity to the trees that produce the famous Winter's bark and Melambo bark, they possess medicinal qualities of no common power. The bark of all of them is said to have a bitter flavor without any astringency, and combined with a hot aromatic principle. In the United States, the bark of *Magnolia glauca* and *Liriodendron tulipifera*, is employed for the same purposes as Jesuit's bark, and from the fruit of *Magnolia acuminata*, a tincture is prepared which has some reputation for removing attacks of rheumatism. The fruit of *Illicium anisatum*, is the material which flavors the liqueur called Anisette de Bourdeaux. The *Magnolias* are exclusively inhabitants of Asia and America, no species having hitherto been found either in Europe or in Africa.

1215 *Illicium W.*

1216 *Liriodendron W.*

1217 *Magnolia W.*

1218 *Michelia W.*

ORDER IV. ANNONACEÆ.

The plants of this order are closely allied to *Magnoliaceæ*, from which they are principally distinguished by the absence of stipule, and by the structure of their anthers and seeds. The latter consist of a hard mass of albumen, ruminated, as the botanists call it, that is to say, perforated by the substance of the seed-coat, in every direction. They are all trees or shrubs, and chiefly inhabitants of the hottest parts of the tropics, but a few have been discovered straggling into the temperate zones of America. The fruit of the *Annona* is in many species highly esteemed as an article for the desert, especially that of the *Cherimoyer*, which has the reputation of being the finest fruit in the world, next to the *Mangosteen*. The hard fruits of the species of *Uvaria* are highly aromatic; those of one of them furnish the *Piper* athiopicum of the shops. The genus *Asimina* is the only one which contains any hardy species, and these are so delicate as to be seen very rarely in this country. In Brazil, the bark of *Xylopia sericea* is used for cordage; for which it is admirably adapted.

1219 *Uvaria W.*
1220 *Annona P. S.*

1221 *Artabotrys R. Br.*
1222 *Guatteria R. & P.*

1223 *Asimina Ad.*
1224 *Xylopia W.*

ORDER V. MENISPERMEÆ.

The order of *Menispermæ* consists entirely of twining shrubs with minute flowers. They are extremely dissimilar in habit from the orders which are placed near them, and occupy their present station entirely on account of certain minute but important characters in their fructification. With the exception of *Schizandra coccinea* none of them are worth cultivating as plants of ornament. The berries of *Lardizabala biternata* are sold in the markets of Chile, under the name of *Aguilboqui*, *Guilbogui*, or *Coguil-Iochi*, according to different travellers. The bitter, diuretic, and aperient sorts of *Pareira brava*, are produced by a species of *Menispermum*, as is also the famous Columbo root, so much esteemed for its intense bitterness, and for its use in diarrhoea and dysentery. The poisonous drug, called *Cocculus indicus* in the shops, is the seed of *Menispermum Cœculus*. Several Brazilian species of *Cœculus* are said to possess powerful febrifugal properties. No species of *Menispermæ* is found in Europe; they are chiefly natives of tropical America and Asia.

858 *Wendlandia W.*
1972 *Schizandra W.*

2100 *Menispermum D.*
2101 *Cœculus Dec.*

2116 *Cissampelos Dec.*

ORDER VI. BERBERIDEÆ.

With the exception of *Berberis* this order does not contain any genus of much interest; most of the others are low, inconspicuous, herbaceous plants; *Nandina* is an elegant Japanese shrub. The *Berberises* are all shrubs of much beauty and interest, especially the species with pinnated leaves, which are sometimes called *Mahonias*. These are all inhabitants either of Europe, Asia, or North and South America; none have ever been seen in Africa or New South Wales. Many of the finest species from Chile and India yet remain to be introduced. The berries of the *Berberises* are acid and astringent; the latter quality is especially abundant in the stem and bark.

297 *Epimedium W.*
825 *Leontice W.*

826 *Caulophyllum Mich.*
827 *Diphyllea Mich.*

829 *Berberis W.*
830 *Nandina W.*

ORDER VII. PODOPHYLLACEÆ.

Little interesting herbaceous North American plants, nearly related on the one hand to *Nymphaeacæ*, and, on the other, to the herbaceous genera of *Berberidæ*. Their juice is held to be purgative.

1166 *Podophyllum W.*

896 *Jeffersonia Ph.*

ORDER VIII. HYDROPELTIDEÆ.

This order differs from *Nymphaeacæ* chiefly in having a definite number of seeds. It consists of only two genera, each containing a single species. Both are little floating plants of tropical and northern America. Nothing is known of their properties.

1240 *Hydropeltis H. K.*

ORDER IX. NYMPHÆACEÆ.

Like the last, these are all floating plants, and, to gardeners, possessed of great interest, on account of the elegant form and various hues of their flowers. Three species are known as the lilies of our own streams and ponds, and the remainder occupy similar stations in other countries. Some of the Indian species of *Nymphaea* are delightfully fragrant. The holy *Cyamus*, or Pythagorean bean of antiquity, is the produce of the *Nelumbium*, a stately aquatic, which abounds in all the hotter countries of the East, where its roots are frequently used as an article of food. The ditches, about Pekin and other Chinese cities, are literally choked up with its abundance. The pericarpia or beans are oblong, hard, smooth bodies, and possess the power of vegetating after having been dried for even thirty years. The flowers and roots of the common white *Nymphaea* have been long celebrated for their sedative and antiaphrodisiac qualities, which are, however, now considered doubtful. In Sweden, in years of scarcity, the roots of *Nuphar lutea* are pounded into cakes along with the inner bark of *Pinus sylvestris*.

This order has been the cause of much difference among botanists, as to its true station in a natural classification, its structure being of so doubtful a character as to leave room for disputing whether it belongs to Dicotyledones or Monocotyledones. Upon this subject M. Decandolle has the following remarks: "Gærtner declares that the embryo is undivided, and therefore monocotyledonous. In 1802, I remarked in the Bulletin Philomatique, that the embryo both of *Nymphaea* and *Nóphar* is enclosed in a peculiar integument, and that a dicotyledonous structure is apparent when that integument is removed; shortly after, M. Mirbel declared that the embryo of *Nelumbium* has two thick cotyledones; in 1806, M. Turpin gave an accurate description of the fruit of *Nelumbium luteum*, without however removing the doubts about the real structure of the embryo, and two years afterwards his colleague, M. Poiteau, described the seed and germination of the same plant, pointing out that the embryo consisted of two thick cotyledones enclosed within a stipular membrane, but destitute of radícula: this was subsequently confirmed by M. Mirbel after very minute anatomical examination; that observer compared the seed of *Nelumbium* to the seed of *Amygdalus*, and also to that of *Piper* and *Saururus*, and also demonstrated that the structure of the stem was analogous to that of exogenous or dicotyledonous plants. A very different opinion was shortly afterwards held by M. Correa de Serra, an observer of the highest order, who admitted indeed that *Nymphaeaceae* are exogenous, but contended that the parts which had been taken by previous observers for cotyledones were, in fact, a mere expansion of the radicle, and that cotyledones were as entirely absent in *Nelumbium* as in *Cuscuta*. In the meanwhile M. de Jussieu adhered to the old opinion, that *Nymphaeaceae* are monocotyledonous; in which he was supported by the late Professor Louis Claude Richard, a name for ever memorable in the annals of Carpology, who published a new view of their structure, in which he differed materially from all his predecessors; this botanist considered the stipular membrane of Poiteau a simple cotyledon, and the cotyledons of that writer the hypoblastus, or *body of the radícula*; he also refused to admit any evidence derived from the anatomical structure of the stem. In this conflict of opinions, I have determined to station *Nymphaeaceae* among Exogenes, for the following reasons: 1st, because the structure of their stem is that of Exogenes rather than of Endogenes; 2dly, because the two opposite bodies, enclosed within the little bag or stipular membrane, described by Poiteau, appear to be undoubtedly cotyledones, which is confirmed by the presence of a plumula between them in *Nelumbium*; 3dly, because of the structure of their flower, which has a great affinity with that of *Pæonia*, *Magnolia*, and *Papáver*; 4thly, on account of the similarity between their fruit and stigma and that of *Papáver*; 5thly because of their milky juice and convolute leaves, two characters which are not known to exist among Endogenes." Those who are interested in pursuing this curious discussion any farther, will find many remarks and illustrative figures in the English edition of the *Analyse du Fruit*, published by Mr. Lindley in 1819.

Section 2. *Carpella solitary or connate; Placentæ parietal.*

ORDER X. PAPAVERACEÆ.

These plants are better known for their medicinal properties than for their beauty. Some of them are the common pests of corn fields, and with grain have been disseminated over all the world. *Sanguinaria* is a neat little American plant well known for its crimson juice, and the emetic purgative powers of its roots. *Sarcocénna* is a genus of very doubtful affinity; consisting of curious little American marsh plants of difficult culture, and remarkable for the singular pitcher-like form of its leaves. The peculiar power of the poppy is, as is well known, narcotic; a property which pervades all the order, although in a less intense degree in all than in the official *P. somniferum*, from which exclusively the drug opium is obtained. The Mexicans use the expressed oil of the seeds of *Argemón mexicana* for polishing furniture.

1167 *Chelidónium* W. 1171 *Meconopsis* V. g.

ORDER XI. FUMARIACEÆ.

Tender herbs, with finely cut leaves and annual stems, abounding in a watery juice; without any appearance of milkiness. They are reckoned slightly diaphoretic and aperient, but their medical properties are trifling. Formerly they were combined with *Papaveraceae*, from which they are now universally distinguished. The greater part of them are natives of hedges or thickets in the cooler parts of the northern hemisphere; two are natives of the Cape of Good Hope. Many of the species are beautiful ornaments of the flower-garden.

1503 *Cysticápnos* W. en. 1505 *Adlámia* Raf. 1507 *Fumária* P. S.

ORDER XII. CRUCIFERÆ.

The importance of this order to mankind, and the singular nature of its botanical characters, render it expedient to speak very fully upon it: in which the remarks of the learned M. Decandolle, who has paid *Cruciferae* particular attention, will be chiefly followed. The order consists wholly of annual or perennial, often biennial herbs, occasionally assuming a suffruticose habit; then, however, never exceeding the height of three feet. The roots are either thick and perennial, or annual or biennial and slender, almost always perpendicular and undivided. The young roots are tipped with a little sheath, called the coleurhiza, which is produced by the extended ruptured coat of the epidermis when the rootlet first appears. This is a curious character, and deserves attention. The stems are round or somewhat angular, branched, and often, even in the annual species, indurated at the base. The branches proceed from the axillæ of the leaves, but the uppermost ones are abortive in most cases. The racemes are always opposite to the leaves; sometimes the terminal branch is abortive when the raceme appears to be terminal; but this is merely owing to that circumstance. The leaves are simple, generally radical or alternate, rarely opposite. The flowers are either white, yellow, or purple, or in a few *Cape* species bright blue. The fruit is called either a siliqua or silicula, the former being a linear pod containing many seeds, the latter a roundish pod containing one or very few seeds, whence this order, which is the same as the Linnæan class *Tetradynamia*, is divided by Linnæus into two parts, called *Siliculosæ* and *Siliculosæ*. In the seed, the radicle and cotyledons are applied to each other in different ways, from which the sorders of M. Decandolle derive their characters. When the edge of the cotyledons is pressed close to the radícula, so that a cross section would be thus $\bigcirc =$, the cotyledons are said to be incumbent, as in all *Pleurorhizæ*; when the side of the cotyledons is pressed to the radícula thus $\bigcirc ||$, the former are called incumbent, as in *Notorhizæ*. If the cotyledons are incumbent, and at the same time half folded together or conjugate, thus $\bigcirc >$, the suborder *Orthoploceæ* is formed; when the cotyledons are incumbent and spirally twisted, so that a section would resemble this $\bigcirc || ||$, they constitute the suborder *Spirolobæ*; and finally, when the cotyledons are incumbent, and doubled twice in their length, thus $\bigcirc || || ||$, we have *Diplocolobæ*.

The whole order is preeminently European; 166 species are found in the north and middle of Europe, and 178 on the sea-shores of the Mediterranean; 45 are found between Mogadore and Alexandria; 184 in the countries of the East, that is to say, Syria, Asia Minor, Tauria, and Persia; 99 in Siberia; 35 in China, Japan, and India; 16 in New Holland and the South Sea islands; 6 in the Mauritius and adjacent countries; 70 at the Cape; 9 in the Canaries; 2 in Saint Helena; 2 in the West Indies; 41 in South America; 48 in North America; 5 in Kamtchatka and the bordering islands; and finally, 35 are common to several parts of the globe. From this it appears that there are about 100 species in the southern hemisphere, and about 800 in the northern: or, if they are considered with reference to the zones of temperature, 205 are natives of the frigid zone of the northern hemisphere; 30 of the whole of the tropics; 548 of the temperate zone of the northern hemisphere; and 86 of the southern. The forty-first degree of north latitude may be considered the equa-

torial line of Cruciferae, about half being found on one side of it, and half on the other. Their station is very variable; many inhabit open sandy places, some form the vegetation about the limits of the perpetual snows of lofty mountains, and many follow the foot-steps of man through all parts of the world.

The useful qualities of the turnip, the radish, the rape, and the cabbage, and its multifarious varieties, are all well known. The greater part of the order consists of plants possessing high antiscorbutic powers. These appear to depend upon a certain acrid volatile oily principle, the chemical nature of which is imperfectly known. It is particularly abundant in the seeds of mustard and the roots of horseradish, and the leaves of *Lepidium latifolium*, which latter exercise a violent influence upon the organs of digestion. The same sort of acrimony, but in less degree, is found in the herbage of the scurvy-grass and the roots of the radish, which act much more mildly when taken inwardly; thus, when any cruciferous plants are found to be eatable, either from culture or other circumstances, it is to be understood to depend upon a reduction of this acrid principle. The exciting powers of this last, are what render the horse-radish, the scurvy grass, and others, so remarkably useful as antiscorbutics; they are also believed to possess diuretic and diaphoretic properties. It is to be remarked, that Cruciferae are always eatable when their texture is succulent and watery, as in the roots of the radish and the turnip, and the leaves of the cabbage tribe. A further diminution of the acrid principle is produced by blanching. Cruciferae are said to possess a greater share of azote than any other tribe of plants; as is apparent in their fetid smell when fermented. The embryo of all the order abounds in oil, whence many species are employed with much advantage for expressing, either for eating or for feeding lamps. Some of the species are extremely beautiful and fragrant, as the Stocks, the Gillyflowers, the Hesperides, the Candytufts, and many others. The Hutchinsias, Drabas, Cardamines, &c. are among the most interesting of alpine plants

ORDER XIII. FLACOURTIANÆ.

A very small order formerly comprised in Tilliaceæ. It is remarkable on account of the structure of its fruit, to the inner lining of which the seeds are attached upon a branched placenta. Nothing is known of the properties of the Flacourtiæ. The berries of Flacourtia Ramóntchi are eaten in Madagascar. The order consists entirely of small tropical trees or bushes.

2102 Flacourtia *W.*

ORDER XIV. CAPPARIDÆ.

These are nearly related to Cruciferae, of the properties of which they partake. Many are very pretty plants, especially Cleóme rusca, and the various species of Crataeva. The common caper is an elegant bush, remarkable for its large white flowers and long purple stamens. The species are found occasionally in various parts of the world. The different kinds of Capparidæ are reputed to be stimulating, antiscorbatic, and aperient. The bark of the root of the common caper passes for a diuretic medicine. Several species of Cleóme have an acrid taste, which has been compared by travellers to that of mustard. The root of Cleóme dodecandra is employed as a vermifuge in the United States; and the leaves produce an inflammation of the skin, whence they are used in Cochín-china as a sinapism. *Dec.*

1162 Capparidæ *W.*1086 Crataeva *W.*1448 Cleóme *W.*

ORDER XV. VIOLARIÆ.

This is one of the most favorite orders with gardeners; consisting, as it chiefly does, of the Violet genus, from which most of the others are recent dismemberments. The greater part are hardy herbaceous plants, some of which are remarkable for their perfume, others for their brilliant colors, and all for their neatness. They are natives of the temperate or cold zones of both hemispheres, often growing at great elevations above the sea. Among them is a tribe called Alsodineæ, consisting of suffrutescent tropical plants; but none of them have been introduced into the gardens of this country. The attention of collectors should be directed to procuring the shrubby Violaceæ of Brazil, some of which possess great interest. The medical properties of the order are found principally in their roots, which appear to possess, in all cases, emetic properties, in a greater or less degree. One of the Ipacacuahas is the root of a Brazilian violet. M. Decaudolle has the following observations upon the affinities of the Violaria:—They are very nearly akin, he observes, to the Polygalæ and Droseraceæ, and especially to the Passifloræ. From the first they are distinguished by their unilocular fruit, leaves furnished with stipules and two-celled anthers; from Droseraceæ by their solitary style, lengthened embryo and stipulate leaves, the venation of which is involute, not circinate. From Passifloræ they differ in their fruit being capsular, not berried; in their albumen being compact and shining, not pitted; in their stamens being hypogynous, not perigynous; in their anthers being attached along their whole length, not fixed by their middle; finally, in their stigmas being one and not three. The genus Calyptrotrion approaches Passifloræ in its twining stem, and Hymenanthéra borders upon Polygalæ on account of its monospermous pericarpium with solitary pendulous seeds.

541 Ionidium *Vent.*540 Viola *W.*539 Sauvagéia *Jacq.*

ORDER XVI. POLYGALEÆ.

Most of the plants of this order are interesting, and deserving the attention of the gardener, some for their neatness, some for their beauty, and some for their use in medicine. They are natives of most countries, and are either low herbaceous plants, occasionally less than an inch in height (small specimens of Polygala purpurea), or shrubs varying from a dwarf, rigid, spiny habit, to a tall, graceful, drooping appearance. Polygalæ are remarkable for the union of their stamens into a single body, their one-celled anthers opening with a pore, and their irregular flowers, one of which is often keel-shaped, and beautifully crested or bearded. The leaves have generally a bitter astringent taste, which is much more abundant in the roots, combined with an acrid and somewhat resinous flavour: these properties are particularly sensible in P. sénega, which is reputed a sudorific, diuretic, sialagogue, cathartic, or mild emetic, according to the manner in which it is administered. The Yelholi of South America, the root of a species of Monnina, has the same properties as P. sénega, and is particularly used as a remedy for dysentery. The well known Rattany, or Ratanhia root, of Chile, is the produce of a plant of this order, and possesses powerful tonic and astringent qualities. According to the analysis of a French chemist, it contains gallic acid, but neither tannin nor resin.

1508 Polygala *W.*1509 Muráltia *Neck.*1510 Múndia *Kunth.*1511 Securidáca. *L.*

ORDER XVII. DROSERACEÆ.

The order of sun-dews is a small group of plants, natives of marshes or inundated grounds in all the temperate parts of the world. The species are very remarkable for the abundance of glandular hairs with which all the parts of the foliage are covered. Only two species are in any degree frutescent. The young leaves are always rolled up in the circinate manner, so remarkable in ferns. Their medicinal properties appear to be trifling: the leaves have the power of curdling milk.

702 Drosera *W.*1009 Dionæa *W.*

ORDER XVIII. BIXINÆ.

The plants of this order are few in number, and not remarkable either for beauty or use. The Bixa orellana is chiefly known for producing the seed called in the shops Arnotta (*Rocón*, Fr.), and used for coloring cheese; the properties of the Arnotta are slightly purgative and stomachic. They are all bushes or small trees, and mostly tropical. Azaras, Chilian shrubs with fragrant flowers, are not yet known in the gardens of Europe.

1178 Bixa *W.*1179 Prockia *L.*

ORDER XIX. CISTINÆ.

The common rock roses of our gardens give an accurate idea of this order, which contains little else. They are all very ornamental, and particularly well calculated for covering rockwork. The species of Cistus and Helianthemum have been multiplied by Dunal in an extravagant manner, as has been well demonstrated by Mr. Bentham. They are natives of most parts of the world in dry elevated places. The gum called Ladanium is the produce of some kinds of Cistus; it exhales a fragrant perfume when burnt, and possesses slightly tonic and stomachic properties.

1089 Hudsónia *W.*1197 Cistus *J.*1198 Helianthemum *J.*222 Lechea *W.*

Section 3. *Ovarium solitary. Placenta central.*

ORDER XX. CARYOPHYLLÆ.

These consist of herbs or low undershrubs, inhabiting the mountains and pastures of all parts of the world. In Europe and Siberia they are particularly abundant, and least so in Africa and South America. Many are common weeds, as most of the *Cerástiums*, *Spérgulas*, and others. Several of the *Silènes* are very ornamental, and among the *Arenáries* are to be found some dwarf species of considerable elegance. But it is in *Dianthus* that the pride of the order consists: this genus is almost unrivalled for the brilliancy of its colors, the neatness of its foliage, and the perfume of its flowers. From the finest of its species the title of the order has been derived. The virtues of *Caryophyllæ* are slight. *Saponária officinális*, and one or two others, have been praised for possessing antisyphilitic properties; the root of *Silène virginiana* is reputed anthelmintic; and the *Arenária peploides*, being fermented, is used by the Icelanders for food.

920 <i>Muehringia W.</i>	220 <i>Holósteum W.</i>	688 <i>Alsine W.</i>	

ORDER XXI. LINÆÆ.

Separated by M. Decandolle from *Caryophyllæ*, from which it is well distinguished by its fruit having several cells, or in the language of the botanist just named, being formed by the cohesion of several carpella. Most of the species are pretty plants, bearing yellow, blue, or white flowers. They are of immense importance in the world, on account of the tenacity of their fibres when made into flax. The seeds of common flax are between mucilaginous and oily; the leaves of *Linum cathárticum* and *L. selaginoides*, the latter a native of Peru, are purgative.

701 *Linum W.*321 *Radiola Sm.*

ORDER XXII. FRANKENIACÆÆ.

Distinguished from *Caryophyllæ* by the fruit not having a central separate placenta, but bearing the seeds on the inner margin of the valves. The species are natives of arid situations in Europe, Africa, and South America. They have not much beauty, and no known medical properties. Besides the genus here recorded, there are two others mentioned by M. Decandolle.

835 *Frankénia W.*

ORDER XXIII. MALVACÆÆ.

Before this order was dismembered of *Bombacææ* and *Byttneriacææ*, it contained most of the grandest flowers in nature. Even now, the splendour of the various species of *Málva*, *Althæa*, to which the hollyhock belongs, and *Hibiscus*, renders it one of the most remarkable groups of plants. With the exception of the numerous genus *Sida*, nearly all *Malvacææ* are objects worthy of the gardener's care, particularly those which are hardy. In stoves or greenhouses, the softness of their branches and leaves render them peculiarly liable to the attacks of the red spider, mealy bug, and scale, from which few collections are free; a circumstance which makes them less generally esteemed than the surpassing beauty of many of them merits. The greater part of the order is clothed with stellate pubescence, and a reniform one-celled anther is a character common to the whole. These two peculiarities, together with the alternate stipulate leaves, distinguish *Malvacææ* from all the rest of *Dichlamydeæ*. All the species abound in a nutritive mucilage; a quality which renders the young heads of the *Ochro*, or *Hibiscus esculéntus*, an object of great value within the tropics, as an ingredient in soups. In Brazil, the *Abútion esculéntum* serves the same purposes. The emollient properties of *Althæa officinális*, or *Guimauve* of the French, are well known to physicians, as a remedy for catarrhs and pulmonary complaints. A decoction of the leaves of *Sphærlícea disiplatina* is used for similar objects in Brazil. A species of *Pavónia* is employed in the same country as a diuretic in the form of a decoction. The straight shoots of *Sida micrántha* are employed as rocket-sticks at Rio Janeiro. The chewed leaves of *Sida carpinifolia* allay the inflammation occasioned by the stings of wasps. The tough fibres of many *Malvacææ* are manufactured into cordage. Their petals are astringent; whence those of *Hibiscus Rósa sinénsis* are used in China to blacken the eyelashes and the leather of shoes. The fibrous threads in which the seeds of *Gossypium* are enveloped furnish the valuable cotton, an article of immense importance to the world; these threads when examined by the microscope, will be seen to be finely toothed, which explains the cause of their adhering together with greater facility than those of *Bombax* and several *Apocineæ*, which are destitute of teeth, and which cannot be spun into thread without an admixture of cotton.

1471 <i>Málope W.</i>	1476 <i>Maláchra W.</i>	1487 <i>Sida W.</i>	1482 <i>Redoutéa Vent.</i>

1473 <i>Kitaibéla W.</i>	1486 <i>Periptera Dec.</i>		

ORDER XXIV. BOMBACÆÆ.

Distinguished from the last by the imbricate axtivation of the calyx, and the arrangement of the stamens in five sets, or, in Linnæan language, brotherhoods. The species are mostly fine trees with large showy flowers, and natives of the tropics. Some of them are among the largest trees in the world; *Adansónia*, the *Baobab* of Senegal, has been seen with a diameter of twenty-five feet, and specimens of *Bámbax Ceiba*, and *Eriodéndron anfractósum*, are not uncommon an hundred feet in height. The wood of all the species is light and soft, as in *Malvacææ*, from which this order probably does not differ in its medicinal properties.

1458 <i>Ochróma W.</i>	1490 <i>Carolínea W.</i>	1492 <i>Bómbax W.</i>
1466 <i>Helicteres W.</i>	1491 <i>Adansónia W.</i>	1493 <i>Myródia W.</i>

ORDER XXV. BYTTNERIACÆÆ.

Much the same kind of plants as those of the two last orders, from which they were not formerly distinguished; and from which they scarcely differ, except in their bilocular anthers. Many of the *Stercóríals* are fine umbrageous trees, the seeds of which are large and eatable; especially those of the famous *Kola*, which possess the property, being chewed, of rendering bad water pleasant to the palate. The seeds of the *Chicha*, another and very noble species of the genus, are highly esteemed in Brazil for the desert. *Astrapæa*, and several other genera related to it, are among the most beautiful in the world. The flowers of a species of *Pentapétes*, called by the Indians, *Machucunha*, give out a mucilaginous refrigerant juice, which is employed in gonorrhœa. *Guazúma ulmifolia* has its fruit filled with a pleasant mucilage, which is sweet and very agreeable; an extract of the bark of the same plant is used in Martinique to clarify sugar; its old bark is

employed in the form of a strong decoction, as a sudorific. *Walthéria* Douradinha contains a great deal of mucilage, and is employed by the Brazilians as an antisyphilitic.

Tribe 1. STERCULIACEÆ.

2036 *Stercúlia W.* 2037 *Heritiéra W.*

Tribe 2. BYTTNERIÆ.

1607 *Theobróma W.* 1608 *Bubróma W.* 704 *Rulingia R. Br.* 527 *Ayénia W.*

1468 *Pentapétes W.* 1457 *Melhánia J.* 1470 *Pterospérnum W.*

ORDER XXVI. TREMANDREÆ.

A very small order containing only seven species, all small bushes, natives of New Holland, and remarkable for the peculiar neatness of their appearance. In habit, they may be compared to heaths, with which they agree in the anthers bursting by a pore at the end. Nothing is known of their properties.

879 *Tetrathéca Sm.*

ORDER XXVII. TILIACEÆ.

Trees, shrubs, or herbs, in general not remarkable for their beauty, the greater part of the last being the commonest weeds of the tropics. The Lime, from which the order derives its name, is a genus of fine trees with fragrant flowers, and *Sparmánia* and *Enteléa* are handsome broad-leaved greenhouse arborescent plants. The inner bark of *Tilia* is tough and separable, and supplies the material whence the Russia mats used by gardeners and others are prepared. *Córchorus olitórius* is cultivated in Egypt as a kitchen-garden vegetable; the fibres of the bark of *Córchorus capsularis* are twisted into fishing lines; and the roasted nuts of the Lime tree are reported to bear some resemblance to chocolate.

1087 *Triumphétta W.* 1181 *Apeiba W.* 1184 *Muntíngia W.* 1186 *Tília W.*
1100 *Heliocárpus W.* 1182 *Sparmánia W.* 1185 *Gréwia W.* 1187 *Córchorus W.*
1180 *Sloánia W.* 1183 *Enteléa R. Br.*

ORDER XXVIII. ELÆOCARPEÆ.

These differ from *Tiliaceæ* in nothing except their lobed petals and anthers opening by two pores at the apex. The flowers of some of the species of *Elæocárpus* are fragrant, the fruit eatable, and the hard rugose stones manufactured into necklaces.

1192 *Elæocárpus W.*

ORDER XXIX. SAPINDACEÆ.

One of the distinctive peculiarities of this order consists in the petals having an additional lobe in the inside, or a tuft of hairs instead. Nearly all the plants have compound leaves, and bunches of white flowers; a few of them are twining herbs, but the greater part are trees or shrubs, all natives of the warmer parts of the world, and in a great proportion, of the East. The only genus which will bear the climate of England is *Kolreutéria*, a fine shrub or small tree, with panicles of white or pale yellow flowers. *Nephélium* and *Dimocárpus* are both genera bearing excellent fruit. The rind of the berry of *Sapindus saponária* is of a soapy quality, as the name of the plant indicates. The pulp of *Melíococca*, the arillus of *Blighia sápidá*, and the kernel of *Berthollétea* and *Pékea* are all excellent eating.

926 *Sapindus W.* 832 *Ornitrophe W.* 887 *Kolreutéria W.* 925 *Cardiospérnum W.*
1971 *Nephélium W.* 884 *Melíococca W.* 923 *Paulínia W.* 897 *Dodonæa W.*
883 *Dimocárpus W.* 885 *Blighia H. K.* 924 *Seriána W.* 1991 *Amiróla Pers.*
831 *Cossignia Juss.* 886 *Metáiba Aubl.*

ORDER XXX. HIPPOCASTANEÆ.

The only genus is *Æsculus*, from which some botanists have divided the smooth-fruited species under the name of *Pávia*. The order is much valued for the grandeur of the foliage and flowers of most of the species, which are all hardy trees. Their bitter fruit has sometimes been used as a sternutatory; it contains a large quantity of potash, and an abundance of starch. The bark is astringent, bitter, and febrifugal, and has been recommended as a substitute for *Cinchóna*.

866 *Æsculus W.*

ORDER XXXI. HIPPOCRATICEÆ.

Little is known of this order. The species are tropical arborescent or climbing shrubs, with opposite simple leaves, and small inconspicuous flowers. The genus *Tonsélla*, of which there is none in cultivation, contains some species known in Sierra Leone as bearing poisonous fruit.

83 *Hippocrátea L.*

ORDER XXXII. MARCGRAAVIACEÆ.

Very curious half-climbing shrubs, all natives of hot countries. Some of them bear among the flowers, which are large and showy, singular hollow bodies, like the pitchers of *Sarracénia*. The order has been well illustrated by Professor Hooker, in the 160th article of his *Exotic Flora*.

1163 *Marcgraávia W.*

ORDER XXXIII. ACERINEÆ.

Valuable trees, native of the woods of Europe, Siberia, and North America. Their flowers are in all cases inconspicuous; the breadth and rich color of their leaves constituting their beauty. All the larger species abound in a very saccharine sap, from which sugar is prepared in North America; it is chiefly made from *A'cer saccharinum* and *Negúndium*, but may be obtained from many others.

2143 *A'cer W.*2144 *Negúndium Dec.*

ORDER XXXIV. MALPIGHIACEÆ.

Undulated unguiculate spreading petals form one of the most obvious characters of this order, the species of which are all tropical, and are either trees or shrubs, often climbers. Many of the *Malpighias* are well known

For the prurient hairs produced on the surface of their leaves; their fruit is eatable, their timber of a deep red color, and their bark a febrifuge. Their showy pink or yellow flowers, and firm neat foliage, render all this order worthy of cultivation, except *Aspicárpa*, which is a weed.

1054 <i>Malpighia W.</i>	1056 <i>Hirca W.</i>	1007 <i>Gærtnera W.</i>
1055 <i>Banisteria W.</i>	29 <i>Aspicárpa Rich.</i>	

ORDER XXXV. HYPERICINEÆ.

The whole of these abound in a resinous Juice, and are in most cases glandular in some degree. Their leaves are all dotted, and which is very remarkable, the dots are often black, even upon the yellow petals. These latter have a singular obliquity, which is not indicated by their outline, but by the arrangement of their veins. The Juice just noticed as abundant in this order is yellow, viscid, rather bitter, often purgative or antihelmintic; and so very analogous to Gamboge, that the Juice of *Hypericum baccatum*, and some other Guiana species, has received the name of American Gamboge. Most Hypericineæ are bitter, and slightly astringent, whence they have been used as febrifuges. A small part of the order is tropical; but in its most genuine form it consists of herbaceous or undershrubby plants, delighting in the shade of groves and thickets in the cooler parts of Europe and Asia. Nearly all the flowers are yellow; those of *H. cochinchinense* are dull red.

1617 <i>Hypericum W.</i>	1618 <i>Ascyrum W.</i>	694 <i>Parnassia W.</i>
--------------------------	------------------------	-------------------------

ORDER XXXVI. GUTTIFERÆ.

Trees or shrubs found in the hottest parts of the world, and well known by their thick entire opposite leaves and resinous Juice. In the countries where they grow they are of great importance. One, the *Garcinia mangostana*, bears a fruit, the equal of which is supposed not to exist. The well known Gamboge is the inspissated Juice of *Garcinia Gambogia*, and, perhaps, other species; the Juice of others is found an efficacious vermifuge, and also a remedy for the chiggers, one of the worst pests of equinoctial America. The bark and fruit of many *Garcinias* are astringent. The unripe fruits of *Grias cauliflora* are pickled. The flowers of all the order being showy, the foliage good, and the properties interesting, every species deserves cultivation.

1079 <i>Garcinia W.</i>	1190 <i>Mammia W.</i>	2151 <i>Clusia W.</i>
1085 <i>Canella W.</i>	1616 <i>Xanthochymus Rozb.</i>	1188 <i>Grias W.</i>
1189 <i>Calophyllum W.</i>		

ORDER XXXVII. VINIFERÆ.

The vine is the type and representative of this order. *Cissus* and *Ampelopsis* differ little from it in botanical characters, and not at all in habit. The common grape is the only species that bears really good fruit; the American kinds, with large fleshy berries, being spoiled by a disagreeable foxy flavor, which is not found to be removed by cultivation.

501 <i>Vitis P. S.</i>	502 <i>Ampelopsis W.</i>	305 <i>Cissus W.</i>	454 <i>Leça W.</i>
------------------------	--------------------------	----------------------	--------------------

ORDER XXXVIII. GERANIACEÆ.

The *Geraniums* are well known to all gardeners for their beauty, and the facility with which hybrid varieties are produced among them. *Geranium* and *Erodium* are chiefly natives of the northern hemisphere; and *Pelargonium* of the southern. Different as they appear from *Vinifera* in most respects, there are some points in which a curious resemblance may be found between the two orders. The young stems of both are articulated and separable at the articulations; and the lower leaves are opposite, while the upper ones are alternate. In *Geraniaceæ* no tendrils are produced, but the peduncles are opposite to the leaves, as in *Vitis*, and occupy the place of tendrils. M. Decandolle observes, that of the true *Geraniaceæ*, some are slightly acid, especially those of which the leaves and bark are succulent; several exhale a resinous smell which is sometimes agreeable, but occasionally so powerful as to be unpleasant. The resinous principle is so abundant in *Geranium spinosum*, that its stem burns like a torch, and exhales an agreeable perfume. The most common property of European *Geraniums* is to be astringent, which is chemically determined by their Juice being blackened by sulphate of iron; this is particularly remarkable in *G. Robertianum* and *sanguineum*, which are both accounted vulnerary, and in *G. moschatum*, *pratense*, and others, in which it is united to a slight aromatic principle, whence they have been recommended for various purposes, and among others for removing calculous disorders. The astringent property of the *geraniums* is also present in *G. maculatum*, which grows in much abundance about Philadelphia; the root of this plant, boiled in milk, is used for the cholera in children. Barton is of opinion, that it would be a good substitute for gum kino in nephritis and obstinate diarrhoeas.

1460 <i>Erodium W.</i>	1461 <i>Pelargonium W.</i>	1463 <i>Geranium W.</i>	1465 <i>Monsónia W.</i>
------------------------	----------------------------	-------------------------	-------------------------

ORDER XXXIX. OXALIDEÆ.

Formerly confounded with the last order. It is the opinion of modern botanists, that the species are more nearly allied to *Rutaceæ* or *Zygophylleæ*, and that their character and peculiar habit is quite sufficient to distinguish them. The beauty of the genus *Oxalis* is very great, and the readiness with which the species may be cultivated and caused to flower, would have been expected to make them universal favorites; they are not however, much seen in cultivation. Their properties are well known: all of them have a slightly acid taste, whence some have occasionally been employed as salad; their acidity is very agreeable and depends upon the presence of a small quantity of oxalate of potassa. In some of the species of equinoctial America oxalic acid exists in great abundance. Several species are employed in Brazil as a remedy for certain fevers of that country.

1064 <i>Biophytum Dec.</i>	1065 <i>Oxalis W.</i>	1058 <i>Averrhoa W.</i>
----------------------------	-----------------------	-------------------------

ORDER XL. TROPEOLEÆ.

These are climbing or trailing herbs with handsome solitary axillary flowers, and fleshy stems and leaves. They are distinguished from *Geraniaceæ* by their stamens being separate, and not agreeing in number with the petals; by their axillary flowers, and fleshy indehiscent fruit. It is very curious, that this is the only order in which the peculiar acrid flavor of *Cruciferae* is found to exist. *Tropeolum pentaphyllum*, with probably other species, is a powerful antiscorbutic. All are natives of shady places in various parts of South America. The roots of some are fleshy and eatable.

875 <i>Tropeolum W.</i>

ORDER XLI. BALSAMINEÆ.

The flower of this order has been remarked by a learned botanist to be that of *Fumariaceæ*, the capsule of *Oxalis*, the embryo of *Linum*, and the habit peculiar. The well known elastic spring with which the seeds are ejected, constitutes a principal character of the order. All the species are annuals, with the exception of *Impatiens fruticosa*; they delight in moist hot situations, generally within the tropics; and are remarkable for the singularity and varied colors of their flowers.

538 <i>Impatiens W.</i>

ORDER XLII. ZYGOPHYLLEÆ.

The hardness of the wood of the shrubby species of this order is most remarkable, if the softness of the stems of the herbaceous ones is remembered. To this the extreme difficulty of propagating *Guaiacum* is to

be attributed. *Zygophyllum Fabágo* is employed as an anthelmintic, but it is in the Guatacum that the great medicinal virtues of the order are found: all the genus is extremely exciting; the wood and bark of *Guaiacum officinále* and *sánctum* have a rather bitter acrid flavor, and are principally used as sudorifics, diaphoretics, or alteratives; they have been found to contain a particular substance differing both from gum and resin, which has been called guayacine. Many of the species bear beautiful flowers, especially the *Tribulus*, which with their brilliant yellow *Cistus*-like blossoms, enliven many a barren rock in the tropics. None are found in the colder latitudes of the world.

994 *Zygophyllum W.* 995 *Fagónia W.* 996 *Tribulus W.* 993 *Guaiacum W.*

ORDER XLIII. MELIACEÆ.

The nearest affinity of this order is probably with *Sapindacæ*. It is particularly distinguished by the stamens being united into a tube bearing the anthers. The leaves are usually pinnated, and most of the species, which are all either trees or shrubs, are natives of tropical forests. *Mélia* bears bunches of fine lilac colored flowers, but few of the genera are interesting on account of their inflorescence. The qualities of the different species are little known. *Canella álba* is aromatic, and is used in equinoctial America as a spice. The bark of *Guárea trichilioides* is said by Aublet to be purgative and emetic. The pulpy fruit of *Mélia Azedarách* is said to be poisonous; both this part and the inner bark have been used as anthelmintics either in substance or in decoction. It is asserted by Michaux, that the pulp that surrounds the kernel is considered in Peking a specific in scrophulous cases. The oil expressed from the seeds of the same plant is said to have strong antispasmodic powers.

888 *Guárea W.* 988 *Mélia W.* 991 *Ekebérgia W.*
987 *Trichília W.* 989 *Quivisia Cav.* 992 *Heynea Rozb.*

ORDER XLIV. CEDRELEÆ.

Some of the finest trees of the tropical regions of the globe are comprehended in this order, as the well known mahogany, and the New Holland cedar, which is a species of *Cedréla*. Their winged seeds distinguish them from *Meliacæ*. The bark of *Cedréla Géna* is employed in the East Indies as a febrifuge, as is also that of the mahogany in the West. But the most powerful remedy for fevers in the whole order is the *Soymdia* of the West Indies, which is the produce of *Swieténia febrifuga*; its taste is bitter and nauseous, and its virtues are extolled as equalling those of *Cinchóna*.

990 *Swieténia W.* 531 *Cedréla W.*

ORDER XLV. AURANTIACEÆ.

These are also known under the name of *Hesperideæ*. They consist of trees or shrubs of the greatest beauty and utility. The well-known orange and lemon are the representatives of the order, the characters of which are so well defined that there is no material deviation from the type afforded by those species. The thick leaves, articulated with their petiole, and abounding in transparent reservoirs of odoriferous oil, are the most obvious peculiarities. The flowers are fragrant, and the fruit in all cases fleshy, and generally eatable. The wood is particularly close-grained. The volatile oil contained in the reservoirs of the leaves and fruit possesses powerful tonic and stimulating properties. M. Decandolle thus explains the singular structure of the fruit of the orange. In the opinion of this learned botanist it consists, first, of a thick, valveless, indehiscent indusium or coat, which is most likely to be considered a continuous torus. Secondly, of several carpella, verticillate around an imaginary axis, often separable without laceration; membranous, and either containing seeds only, or filled with pulp, lying in innumerable little bags proceeding from the inner coats of the cells.

500 *Triphásia Lour.* 1004 *Glycósmais Corr.* 1005 *Murraña W.* 1196 *Ægle Corr.*
1003 *Limónia W.* 1615 *Citrus W.* 1006 *Coóquia W.* 2149 *Ferónia Corr.*

ORDER XLVI. TERNSTROMIACEÆ.

A very small order, consisting wholly of trees or shrubs, bearing handsome white or yellowish flowers. They are nearly related to *Camelliæ*, from which they do not differ at all in habit. Nothing is known of their properties. Noronha states that a species of *Saurauja* found in Java has a subacid fruit, in flavor resembling the Tomato, and that it is eaten by the Javanese under the name of *Koleho*.

1083 *Eórya Th.* 1494 *Gordónia W.* 1495 *Stuártia W.*

ORDER XLVII. CAMELLIÆ.

Camellias are too well known in our gardens to render it necessary to say much upon their peculiarities. The *Camellia* is one of the most beautiful, and the tea one of the most useful, plants in the world. Both are natives either of China, Japan, or Nepal. The tea is well known for the stimulating influence of its decoction upon the nerves, which is attributed by Cullen to the presence of a narcotic principle. The seeds of *Camellia oleifera* yield a fine oil. None of the species bear fragrant flowers. Their nearest affinity is with *Ternströmiacæ*, from which they probably ought not to be separated.

1496 *Camellia Ker*

ORDER XLVIII. OLACINÆÆ.

Smooth trees or shrubs, with simple stalked exstipulate alternate entire leaves, and little axillary flowers. Botanists doubt whether what is called a calyx is not rather an involucreum, in which case the corolla would become a calyx, and the station of the order among *Monochlamydeæ*, rather than in this place.

890 *Ximénia W.*

ORDER XLIX. RUTACEÆ.

An interesting and extensive, but rather heterogeneous, group of plants, natives of all countries and all situations. The species are either fetid northern herbaceous plants, as the garden rue, or neat heath-like southern shrubs, with an aromatic odor, as the Cape *Diósma*s; broad or long-leaved Australasian shrubs, with a stellate pubescence, as *Phebálium*, or tropical trees with panicles of pallid minute flowers, as the *Cuspárias* and *Xanthóxylyms*. The order contains nearly 300 species, of which but a small proportion is in our gardens. The medicinal properties of many genera are considerable. *Rúta* and *Péganum* are emmenagogue, anthelmintic, and sudorific. *Diósma* abounds in a volatile oil of an agreeable smell, but acrid flavor; several of its species are reputed antispasmodics. The *Xanthóxylyms* are said to possess acrid, stimulating, or tonic qualities; and *Cláva Hérculis* and *fraxincum* are said, in America, to be powerful sudorifics and diaphoretics. According to Barton, they possess a remarkable power of exciting copious salivation, not only when applied to the mouth, but even when taken internally; they have both been found powerful remedies in paralysis of the muscles of the mouth. *Xanthóxylym caribæum* is regarded in Guiana as a detersive vulnerary and febrifuge. The famous febrifugal *Angostura* bark is the produce of *Cuspária febrifuga*.

Tribe I. RUTEÆ.

ORDER L. CORIARIÆ.

Five species constitute the whole of this order, distributed in South Europe, New Zealand, Peru, and Mexico. They possess no beauty, and are only interesting on account of their problematical station in a botanical arrangement. The leaves of *C. myrtifolia* are astringent, and are employed in dying black. Its berries are very poisonous. On one occasion, during the Spanish war fifteen French soldiers were taken ill after eating them, and three died from their powerful narcotic effects.

2091 *Coriária W.*

Section 4. Fruit (gynobasic) inserted into a fleshy receptacle, with which the style is continuous.

ORDER LI. OCHNACEÆ.

Beautiful yellow-flowered tropical shrubs or trees with lucid leaves. The roots and leaves of *Walkera serrata*, a Cingalese plant, are bitter; a decoction of them, either in water or milk, is used in Malabar as tonic, stomachic, and antiemetic. The bark of *Gomphia hexasperma* is found useful in healing sores produced in cattle in Brazil by the stings of insects.

1001 <i>Gómphia W.</i>	1191 <i>O'chna W.</i>
------------------------	-----------------------

ORDER LII. SIMARUBACEÆ.

Thirteen plants, found in equinoctial America, constitute this order. They are trees or shrubs, with an intensely bitter bark, a milky juice, and pinnated leaves. The *Quassia* is well known as the most pure and intense bitter hitherto discovered; the same property exists, in a milder degree, in the rest of the order. *Quassia amara* is a very ornamental plant, but rare, at present, in collections.

1002 *Quássia W.*

SUBCLASS II. CALYCIFLOREÆ.

Petals separate, inserted into the calyx.

ORDER LIII. CELASTRINEÆ.

This order differs from the succeeding, in having the stamens alternate with the petals; the sepals imbricated in aestivation; and the ovary wholly superior. It consists entirely of shrubs or small trees, with simple, rarely compound, alternate or opposite leaves, and inconspicuous flowers of a greenish or white color. Several are favorite ornaments of our shrubberies, as the *Staphylæa*, the *Celastrus*, and the *Euonymus*; the latter of which is valued on account of its beautiful-colored fruit. The fruit of *Euonymus europæus* is a brisk purgative, as is also the inner bark, and in strong doses powerfully emetic. The famous Paraguay tea is the foliage of a species of *Ylex*. The bark of *Prinos verticillatus* possesses such active, astringent, bitter, tonic, and febrifugal qualities, that it is used in North America, with success, as a substitute for *Cinchóna*. A decoction of the twigs of *Mañtenus boáris* is used to bathe the swellings produced by the poisonous shade of the tree *Lithi*.

Tribe 1. STAPHYLEACEÆ.

Tribe 3. AQUIFOLIACEÆ.

682 <i>Cassíne W.</i>	605 <i>Bumálda Th.</i>	828 <i>Prínos W.</i>
301 <i>Hartógia W.</i>	314 <i>Mygínda W.</i>	543 <i>Plectrónia W.</i>
300 <i>Curtisía W.</i>	315 <i>Ylex W.</i>	514 <i>Schrebcúra Retz.</i>

ORDER LIV. RHAMNEÆ.

In habit, this altogether agrees with the last, from which the medical properties of the species are not widely different. Throughout the order, as far as it has been examined, there is a remarkable agreement between the fruit and the inner bark, especially in *Rhámnus cathárticus*, *frangula*, and others, in which they both are purgative and emetic. Some, as the *Jujuba*, and the African *Lote*, nevertheless, yield a wholesome and agreeable fruit; and the berries, of the greater number, yield, under the chemist's hands, green or yellow dyes of much importance in manufactures. The leaves of *Rhámnus thezans* are substituted for tea by the poorer sort among the Chinese. The bark of *Ceanóthus carólus* is esteemed in Mexico as a good febrifuge.

506 <i>Zizyphus W.</i>	503 <i>Rhámnus W.</i>	542 <i>Phýlica W.</i>	532 <i>Hovénia Th.</i>
505 <i>Paliúrus Gert.</i>	510 <i>Ceanóthus W.</i>	2146 <i>Gouánia W.</i>	2060 <i>Schæffériá W.</i>
504 <i>Enóphia Mich.</i>	512 <i>Pomadérris W.</i>		

ORDER LV. BRUNIACEÆ.

Small heath-like shrubs, all natives of the Cape of Good Hope, and extremely ornamental, both in flower and foliage. Their properties are unknown.

533 <i>Brúnia W.</i>	511 <i>Stáavia W.</i>
----------------------	-----------------------

ORDER LVI. SAMYDEÆ.

Tropical shrubs or small trees, with entire, stipulate, alternate leaves, covered with pellucid dots, and axillary flowers of little show. Some of the species of *Samyda* are pretty, but very rare. Their properties are unknown. M. Decandolle remarks, that in their fruit they approach *Bixineæ* and *Flacourtiacæ*; but on account of the position of their stamens must be arranged in the vicinity of *Rhamnææ* and *Rosacææ*.

1034 *Samyda W.*

ORDER LVII. HOMALINEÆ.

Evergreen handsome shrubs, with alternate leaves and deciduous stipulæ; they are readily known by their parietal placentæ, an unusual character among the orders that surround them. *Blackwëllia fagifolia* has fine bunches of starchy white fragrant flowers. *Aristolëtia* is an evergreen half hardy shrub, with eatable berries. Little is known of their medical properties; the root of *Homálim Racóbea* is used in Guiana as a cure for gonorrhœa.

1108 *Blackwëllia Juss.*873 *Astránthus L.*1084 *Aristolëtia W.*

ORDER LVIII. TEREBINTHACEÆ.

This order is, notwithstanding the labors of several botanists, in a very confused state; from want of sufficient knowledge of many of the genera, which have been hitherto imperfectly described, it is difficult either to determine the value of the characters assigned to the tribes, or the dignity of the tribes themselves. All the species are shrubs or trees, with alternate exstipulate leaves, and inconspicuous flowers, and abound in a balsamiferous resin, which is chiefly present in the leaves and bark, and from which the denomination of the order has been derived. Notwithstanding the minuteness of their flowers, many of the species are valuable as ornamental plants, on account of the beauty of their foliage, others for the sake of their utility in arts or medicine, and others for their fruit. The walnut, the Cashew nut, and the Pistachio are valuable for their nuts, which are well known articles of the markets of Europe. The *Spóndias* and *Mángo* are equally famous in the tropics. The well-known balsam of Tolu is the produce of the *Toluifera*; the balsam of Mecca, of the *Amýris gileadensis*; and balm of Acouchi, of the *Veicia acuchini*; gum comes from *Amýris elemifera* and *Veicia leptophylla*; mastic from *Pistácia atlántica* and *lentiscus*; and Venetian turpentine from *Pistácia terebinthus*. *Schinus Mólle* produces a resin which in Peru is used as a dentifrice, as myrrh is with us. Some of the best varnishes are prepared from the exudation of *Amýris guianensis*. *Rhus vérnix*, copallina, and others, the finest kinds of incense are also afforded by plants of this order, such as the wood and resin of the different species of *Veicia*, of *Amýris balsamifera*, and of *Canárium commúne*, the *Coumia*, which is used in Guiana for such purposes, and finally, the *Boswellia thurifera*, which is the true frankincense of Indian temples. But among the fragrant and wholesome plants of which the order chiefly consists, lie concealed others in which acrid and poisonous qualities no less abound. Such are several pieces of *Rhus*, the juice of which produces blisters upon the skin, and the *Amýris toxicifera*, the juice of which is accounted poisonous. To conclude this long list of the uses and dangers of *Terebinthaceæ*, the bark of *Erúcea* is used as an astringent in dysenteries, that of *Rhus glábra* as a febrifuge and as a mordant for red colors, and that of *Rhus coriária* as a powerful means of tanning skins of animals. It is curious to remark how strongly *Terebinthaceæ* are connected with *Amentaceæ* through *Júglans*.

ORDER LIX. LEGUMINOSÆ.

The family to which the various kinds of pulse belong is one of the most familiar to the world, and at the same time one of the most useful to mankind. Their papilionaceous flowers characterise a large number, and their pods and pinnate leaves the remainder, with a few exceptions, which it is not necessary to particularise. As objects of ornament, many are possessed of unrivalled beauty, for example, among hardy flowering trees, the *Robinia* and the *Labúrnum*; among shrubs, for decorating the borders of the flower-garden, the various tribes of *Cýtissus*, *Caragána*, *Colúttá*, *Amórpha*, and others; among hardy climbers, the far-famed *Glycine* of China, and its sister of North America, with the species of the herbaceous genera *Vicia* and *Láthyrus*; and, lastly, among hardy herbaceous plants, the numerous species of *Lupinus* and *Astrágalus*. Great, however, as is the beauty of the *Leguminosæ* which can brave the inclemencies of the seasons of Northern Europe, it must give way before the splendor and elegance of their brethren of the tropics. The flowers of the *Erythrina*, or Coral tree, are of the deepest crimson, and borne in profusion upon some of the loftiest trees of the forest. The *Bauhinias*, with their snake-like stems and twin leaves, hang in festoons of flowers from branch to branch of other trees, and are only rivalled by the less vigorous and elegant, but more richly colored blossoms of the *Carpopógons*. But all these, with their broad heavy foliage and gaudy colors, are far surpassed by the rugged trunks, trembling airy foliage, and golden flowers of the *Mimósa*, which cast a charm over even the most sterile deserts of burning Africa. While the forests of hot countries are thus indebted to species of this order for their timber, the meadows and pastures of the same latitudes are enamelled with the flowers of myriads of *Hedýsarums*, and animated by the wonderful motion of sensitive plants. As in our own country, the gayest part of our scenery is in many places indebted to the yellow flowers of our furze and broom, so in other countries the same effect is produced by other genera of *Leguminosæ*; by *Lipária*, *Borbónia*, and *Aspálathus*, at the Cape of Good Hope, and by the *Pultenæas*, *Daviesias*, *Acútes*, and multitudes of similar genera in New Holland. The wood of the order is very hard and durable, with a yellow tinge, sometimes changing into green, as in the *Labúrnum* of Europe, and in the better known Brazil wood of commerce, produced by *Cæsálpinia*. The following useful remarks upon the properties of the order are made by M. Decandolle:—

“The family of leguminous plants, though established upon characters of primary importance, offers, nevertheless, so large a number of species and such singular botanical anomalies, that it is easy to foresee that its properties will exhibit little uniformity. Still more exceptions may be anticipated if one reflects, that the chemical principle which is found most abundantly in every part of leguminous plants, and to which we must attribute their principal properties, is the extractive. It is probable that this principle, either from its own nature, or from its peculiar power of uniting with different matters, or perhaps instead of being a simple principle, it is rather a compound of different matters; it is probable, I say, that the extractive principle exhibits

much less uniformity in its results than any other. It is, without doubt, to the presence of the extractive principle, in considerable quantities, that many leguminous plants owe their purgative properties, which are common to several extracts, and which many chemists attribute to the acetate of potash, which they are almost universally found to contain. Thus the leaves and foliaceous pods of *Cassia senna* *Lin.*, of *Cassia lanceolata* *Forsk.*, of *Cassia emarginata* of the Antilles, of the *Cassia marylandica* employed in the United States, of *Colutea arborescens*, of *Spartium purgans*, and perhaps also of *Coronilla emerus*, act as brisk purgatives, and often cause wind and pain in the bowels. The juice of *Coronilla varia* excites vomiting, and may even become poisonous when taken in too large quantities. It is, perhaps, from a different cause that the pulp which is contained in the husks of leguminous plants operates upon the human body; it purges gently without causing the least pain, and ought to be considered as laxative rather than purgative. Such is the character of the juicy pulp that exists in the *Cassia fistula* *Lin.*, in the *Tamarindus indica* *Lin.*, in the *Ceratonia siliqua* *Lin.*, and probably in the *Mimosa nuda* and the *M. fagifolia*, which are eaten in small quantities in the Antilles, but which, taken more copiously, would have the same effect as our Carobs. There are some fruits of Leguminosae, for example, the *Sophora* and the *Gleditschia*, with tumid pods, in which is found a juice which surrounds, it is true, the seeds, as in the plants just mentioned, but which differs from them altogether in its very astringent and nauseous flavor; the nature and properties of this juice deserve to be examined by chemists, and would undoubtedly throw some light upon the nature of Leguminosae. I am induced to think, that the astringent juice of the *Sophora* is a secretion of the pericarp, whilst the sweet and purgative juice of the *Cassia* would be a secretion of the external part of the seed; but this hypothesis requires to be verified: what leads me to this opinion, is the flavor commonly found in husks: in the Carobs, for example, the husk is astringent, and the pulp sweet and laxative. But let us return to the properties which may be attributed to the extractive principle. It is undoubtedly from some one of these modifications that the singular property of the *Piscidia* and many *Galégas* is derived, which are employed in America to stupefy fish, which are taken by this means as readily as with *Nuxvomica*. The decoction of the root of *Galéga virginiana* is considered in America as a powerful vermifuge. It is, perhaps, indeed, to the very same cause that the rubefacient powers of the fresh leaves of some Leguminosae are to be ascribed, which act readily upon the skin if applied as plasters; as, for example, in *Ornithopus scorpioides* among ourselves, and *Hyperanthera moringa* elsewhere. It appears to me, that it is to the greater or less considerable mixture of the extractive principle with the fecula contained in the seed, that the different properties of the pulse of leguminous plants may be attributed. If found in small quantities, the seed may serve as food for man and animals, as we see in French beans, peas, lentils, chick peas, beans, and many others, &c. If found in a more considerable quantity, it will render them purgative or emetic, as in the *Cytisus laburnum*, the *Anagyris foetida*, and even in most of the *Coronillas*. It is remarkable that the botanical characters of Leguminosae should so strictly agree with the properties of their seeds: the latter may be divided into two sections; namely, first, those of which the cotyledons are thick and filled with fecula, and destitute of cortical pores, and which, moreover, in germination do not undergo any change, but nourish the young plant by means of that supply of food which they already contain; secondly, those of which the cotyledons are thin, with very little fecula, and furnished with cortical pores, and which change at once into leaves at the time of germination for the purpose of elaborating food for the young plant. All the seeds of the first section are employed as food in different countries; none of those of the second section are ever so employed; the *Cajan*, which has long been classed among the *Cytisi*, was apparently an exception to this general rule; but observation has proved the contrary. Bearing in mind its known properties, I formerly paid particular attention to its structure, and I have shown in a note, which accompanies my catalogue of the Montpellier garden, that the *Cajan* forms a particular genus much more nearly allied to the French bean than to the *Cytisi*, and that it, in fact, belongs to the first of the sections which I have just described. The seeds of Leguminosae present also many other anomalies more difficult to reduce to any fixed laws: thus some are found which contain a rather large portion of fixed oil; such as the seed of the *Arachis hypogæa*, lately introduced into European agriculture, and that of *Guilandina moringa* which produces oil of ben; there are some, of which the flavor and smell are rather powerful; as the seed of *Dipterix* or *Coumarouina odorata* *Aubl.*, which, under the name of *Toquin* bean, is used for perfuming snuff; there are others which, like the chick pea, have rather a bitter taste and exciting properties, and are on that account administered for the jaundice. There are others again, like those of the *Andira*, which are so bitter as to be used in Java and Brazil as tonic, alexiteric, and vermifuge. In a word, are not the aperient and diuretic properties which are observable in the herbage and the roots of many leguminous plants, such as broom, beans, *Ononis*, *Guilandina ringa* and *moringa*, *Anthyllis cretica*, &c. to be attributed to a modification of this extractive principle? There are, in another view, roots which are furnished with tubercles, that is to say, with reservoirs of fecula which furnish mankind with wholesome food, as we see in the *Lathyrus tuberosus*, which is eaten in Holland, the *Dolichos tuberosus*, and the *D. bulbosus*, which the Indians use as food. The roots of the liquorice have a sweet and mucilaginous taste, which is well known by every body, and which, united to an acrid and rather exciting principle, causes it to be employed as a pectoral; the analysis of this root, published by M. Robiquet, proves that independently of its woody skeleton, the same kind of amylaceous fecula is found as in the tuberous roots of which we have just been speaking; it is thence seen that the acrid flavor of decoctions of liquorice depends on the small quantity of resinous oil which it contains, and that its sweet properties are by no means analogous to common sugar, since it is insoluble in cold water, soluble in warm water or in alcohol, not capable of fermentation, and does not yield to the action of nitric acid any of the known products of sugar. It may here be added, that the sugary flavor of liquorice, and its other properties, are not confined to this genus; they are found equally in the roots of *Trifolium alpinum*, vulgarly called *Mountain liquorice*; in those of the *Abrus precatorius*, from which a pectoral draught is prepared in Hindoostan, called *Velti*, and in others. The barks of some trees of the leguminous class, are remarkable for their bitterness, and are used as febrifuges; the different kinds of *Geoffroya* possess this bitter and febrifugal quality in a remarkable degree; in India, the bark of the *Echynomene grandiflora* and of the *Casualpina bonducella* are employed for the same purpose. The barks of many leguminous plants are also remarkable for their astringent qualities, caused by the quantity of tannin which they are found to contain; this is observable in the *Acacia Catechu*, and in the *Acacia arabica*, which is used for tanning leather, and elsewhere. It is well known that almost all coloring matter proceeds from the extractive principle; and as it appears that this principle abounds in Leguminosae, we ought to find in them a considerable number of the colors which are used by dyers: to this family, in fact, belong the principal blue colors, known by the name of indigo, extracted from every kind of *Indigofera* and from some *Galégas*; and the red colors, which are yielded by all the species of *Casualpina* and of *Hæmatoxylin*. We may add the red juice, which is drawn from the *Pterocarpus draco* and *Santalium*, under the name of sandal and of dragon's blood; from *Erythrina monosperma*, under the name of gum lac; and also from *Dalbergia monetaria*. These juices appear to differ in many particulars, but their history and analysis are at present so far from being known, that it is impossible to form a true estimate of the nature of their differences. But anomalies of this nature are far from being confined to the plants just mentioned. Among the exotic drugs employed in the arts they are very common: such, for example, are the balsam of *Capivi*, produced by the *Copaifera*; the balsam of Peru, which, Mutis says, is obtained from *Myroxylon*; the *Cachou*, which has been found to be almost pure tannin, and which is supposed to be produced by *Acacia Catechu*; of the same character is that remarkable resin that is yielded by *Hymenoc. Courbaril*; gum Arabic, produced by the bark and roots of *Acacia senegalensis*, *nilotica*, *arabica*, and others; gum tragacanth obtained from *Astragalus creticus*, *gummifera*, and *vérus*; and finally, *manna*, secreted by *Hudfsarum albiq.*

The arrangement of this tribe of plants has been found to be attended with much difficulty. By Linnæus, and the writers who succeeded him, the number of genera was much smaller than those admitted by botanists of the present age; many additions have been made in consequence of the discovery of New Holland, and a large number of subdivisions in old genera have been from time to time introduced by one writer or another. To combine these scattered improvements under one uniform system has lately been attempted by the learned botanist, from whom the foregoing extract has been taken. This was not executed at the time when those parts of the present work, in which leguminous plants are found, were written; for which reason the names

of the suborders will not be found in the body of the work. M. Decandolle's method, however, being here adopted, it will be useful to explain the principles upon which it is founded. He divides Leguminosæ into two grand divisions, the first of which consists of plants, the radicle of whose seed is curved back upon the edge of the cotyledons, and the second of those whose radicle and cotyledons are straight: the former are CURVEMBRIÆ, the latter RECTEMBRIÆ. In the *Curvembriæ*, certain diversities in the structure of the calyx and corolla again divide into two principal forms, one of which, comprehending all the genera with papilionaceous flowers, is called Papilionaceæ, and the other, consisting of a very small number of species, with one or two petals or more, and an obscurely lobed calyx, is called Swartziæ. The last is not subdivided, but the Papilionaceæ resolve themselves into the two great tribes pointed out by M. Decandolle, namely, those with fleshy cotyledons and eatable pulse, *Sarcotobæ*, and those with foliaceous cotyledons and seeds which are not eatable, *Phyllotobæ*. Each of these is divisible by three, upon slight differences in the fructification. In *Rectembriæ* two suborders, Mimoseæ and Cæsalpineæ, are formed upon variations in the æstivation of the calyx and corolla; in the former, it is valvate, in the latter, imbricated; the first constitute a single tribe, the latter divide into three, distinguished by less momentous peculiarities of structure. Having premised thus much, the following tabular explanation will be intelligible:

I. CURVEMBRIÆ.

PAPILIONACEÆ.

a. Phyllotobæ.

- | | | |
|----------|---------------------|--|
| Tribe 1. | <i>Sophoreæ</i> . | Pod continuous. Stamens distinct. |
| Tribe 2. | <i>Loteæ</i> . | Pod continuous. Stamens united by the filaments. |
| Tribe 3. | <i>Hedysarææ</i> . | Pod with transverse articulations. Stamens mostly united by the filaments. |
| Tribe 4. | <i>Viciææ</i> . | Pod polyspermous, dehiscent. Leaves cirrhous, the first alternate. |
| Tribe 5. | <i>Phaseolææ</i> . | Pod polyspermous, dehiscent. Leaves not cirrhous, the first opposite. |
| Tribe 6. | <i>Dalbergiææ</i> . | Pod one or two-seeded, indehiscent. Leaves not cirrhous. |
| Tribe 7. | <i>Swartziææ</i> . | |

2. SWARTZIÆ.

ORDER LX. ROSACEÆ.

With the exception of Chrysobalanæ and Sanguisorbæ, this order is so uniform in its appearance, that Rósa, the type from which all the other genera are to be considered variations, when justly understood, will be found to contain every form of structure which is essential to the order. Having stated this, it will be at once obvious, that if the other genera have such close affinity to Rósa, they must also bear a great analogy in beauty. And this is, indeed, the fact. Amygdalus and Prúnus among trees, and Potentilla, Géum, and others, among herbaceous genera, rival the rose in their blossoms, and, in many particulars, surpass that most lovely of all flowers in foliage and general appearance. But it is not for charms alone of smell, or blossom, or foliage, that this order has fixed itself so high in the estimation of mankind. It has also the rare merit of comprehending all the most important of the fruits of the temperate regions of the world. Thus the apple and the pear belong to Pýrus, the plum and the apricot to Prúnus, the peach and the nectarine to Amygdalus; Eriobótrya produces the loquat, Méspilus the medlar, and finally, the quince is borne by the Cydonia. The medical powers of many plants of this order are not less active than their fruit is excellent. The principal of these is the well-known Prussic acid, which exists in abundance in the leaves and kernels of many genera, especially of Prúnus and Amygdalus: it is the basis of Laurel water, which, when taken in small doses, acts either as a violent purgative or as an emetic; and, in stronger doses, is said to destroy irritability without exciting inflammation; these properties, however, although thus dangerous in the distilled water of the laurel and other similar plants, can scarcely be said to exist in any important quantity in the plants in a state of nature. The kernel of the bitter almond, for example, in which the Prussic acid is more abundant than usual, is used for many culinary and other purposes without any bad effect. There are, however, cases in which it is said to be dangerous to eat the fresh leaves or kernels; as in the Prúnus virginiana, the leaves and fruit of which are reputed in the United States to be poisonous to certain animals. Besides the Prussic acid, there are several other principles which abound in the order. All Drupacæ yield a gum which is nearly allied to gum Arabic, and which affords a strong evidence of the affinity that exists between Rosacæ and Leguminosæ. A great deal of astringency is found in many species, whence different parts have been occasionally employed as febrifuges, and as remedies for hæmorrhage, diarrhæa, and dysentery. The root of the Tormentilla is used for tanning in the Ferro Isles; and that of the Capollim cherry in Mexico. The bark of Prúnus virginiana is used as a febrifuge in the United States; Potentilla réptans has been praised for the same properties. The root of Géum urbánum has been found, by Milandi and Moretti, to contain one eleventh of its weight of tannin; it has been used both in America and Europe as a substitute for Jesuit's bark. The leaves of Drýas octopétala in the north of Europe, of Rúbus árticus in Norway, of Prúnus spinósa and ávium, and of Rósa rubiginósa have been manufactured into a sort of substitute for tea. The bark of the root of Gillénia trifoliáta is remarkable in having, in addition to the astringency already mentioned, an emetic property, on which account it is employed in North America as Ipecacuanha. It is said, that a similar power exists in other Spiræas.

It must not be omitted, that the order Rosacæ nearly answers to the Icosandria of Linnæus.

1131 Méspilus *Lindl.*
1133 Pýrus *Sm.*
1134 Cydonia *Juss.*

ORDER LXI. SALICARIÆ.

Most of these are very showy plants, in particular the genera *Lýthrum* and *Lagerstrœmia*, which are the representatives of the order. They are chiefly natives of temperate climates, on mountains and among bushes. *Glaux* and *Péplis* are common shore plants in England. *Heimia* is remarkable for its yellow flowers. Little is known of the properties of *Salicariæ*; they are mostly astringent; the common *Salicária* is used in inveterate diarrhœas; a species of *Lýthrum* is used in Mexico as a vulnerary and astringent, and *Lawsónia*, which is used by the Turkish women to stain their nails, is also supposed to possess similar properties. There is a plant of this order called *Hanchinol* in Mexico, which is said to possess much more remarkable powers than any of the preceding; its expressed juice, taken in doses of four ounces, excites violent perspiration and secretion of urine, and is said to cure venereal disorders in an incredibly short space of time.

877 <i>Grislea W.</i>	1094 <i>Lýthrum W.</i>	302 <i>Ammánia W.</i>	898 <i>Lawsónia W.</i>

1195 <i>Lagerstrœmia W.</i>	1096 <i>Heimia Lk.</i>	836 <i>Péplis W.</i>	

ORDER LXII. MELASTOMACEÆ.

All these are remarkable as handsome tropical shrubs or trees, with large purple or white flowers, and leaves with several costæ, or nerves as they are incorrectly termed. The genera admitted in the body of the work are those received by the greater part of previous writers; they have been much increased, and apparently with great propriety, by Mr. D. Don. The species are generally ill treated in collections, where they are not unfrequently to be found under the form of sickly stunted plants, instead of noble broad-leaved spreading shrubs, with masses of brilliant flowers. To be grown well they require much heat, much moisture during the summer, and much pit-room and head-room. The fruit of true *Melastomas* is a fleshy insipid juicy berry, which is for the most part eatable, and is often so deep a black as to dye the teeth and mouths of those who eat it. They are nearly related to *Myrtaceæ*, from which they differ in the want of essential oil, and of the dot-like reservoirs of the leaves which contain it. The juice of the leaves of *M. succôsa* and *alata* is used as a lotion for recent wounds by the inhabitants of Guiana.

899 <i>Osbœckia W.</i>	1029 <i>Melástoma W.</i>	1075 <i>Blákea W.</i>
900 <i>Rhœxia W.</i>	1030 <i>Petalóna W.</i>	

ORDER LXIII. MYRTACEÆ.

Dotted leaves, with marginal ribs, and an inferior ovarium and single style, are the great features of *Myrtaceæ*. They are all fine evergreen shrubs or trees, generally bearing white flowers, and in the first section producing fleshy fruit. It is there that the Allspice, the Clove, the Rose-apple, and the Guava find their station, by the side of the common myrtle and pomegranate of Europe. The section with capsular fruit comprehends, with the exception of the gigantic *Eucalyptus*, almost wholly, handsome hard-wooded New Holland or South Sea shrubs, with white or crimson flowers and stamens; yellow flowers are very uncommon. The volatile oil contained in the little reservoirs of the bark, the leaves, and the floral envelopes, gives these plants the fragrance which has caused them to be celebrated by poets of all ages. It is very aromatic, a little acrid, and slightly tonic and stimulant, whether it is under the form of Cajeputi oil, the produce of *Melaleuca leucadendron*, or of oil of cloves or of myrtle. In the clove this oil is so abundant as to constitute nearly a fifth of the whole weight of the calyxes that produce it. There is also a considerable proportion of astringent principle in these plants; in the bark of the pomegranate it is very obvious; and in *Myrtus régni* and *lúma* of Chile, *Eugénia malaccénsis*, it is so abundant as to render a decoction of those plants of great use in cases of dysentery. *Eucalyptus resinifera* produces an astringent resinous substance resembling gum Kino. The leaves of the Chilean myrtles, *Leptospermum scoparium*, and some other species, have been used as substitutes for tea.

Tribe I. BACCATÆ.

1116 <i>Fabricia W.</i>	1610 <i>Melaleuca H. K.</i>	1613 <i>Beaufórtia Br.</i>

Tribe 3. LECYTHIDÆ.

1125 <i>Stravádium Juss.</i>	1497 <i>Barringtónia W.</i>	1498 <i>Gustávia W.</i>
------------------------------	-----------------------------	-------------------------

ORDER LXIV. COMBRETACEÆ.

Combrétum and *Quisquális* are among the most splendid of the climbing plants of the tropics, adorning the trees from which they depend with garlands of white and crimson, and yellow. The bark of *Búcida Bóceras* is used with success in Guiana for tanning leather. The juice of *Terminália vérmix* is employed by the Chinese as a varnish; it is, however, caustic, and its exhalation dangerous; benzoin is the produce of *Terminália Benzóin*. The kernel of several species is eaten as a nut, and the expressed oil has the remarkable quality of not becoming rancid.

544 <i>Conocárpus W.</i>	1027 <i>Getónia Rozb.</i>	2140 <i>Terminália W.</i>
916 <i>Combrétum W.</i>	1028 <i>Quisquális W.</i>	

ORDER LXV. PASSIFLOREÆ.

The beauty of *Passiflóras* is well known; they are remarkable for the singular arrangement of the stamens and pistillum, upon a column surrounded by several lines of circumvallation, formed by as many rows of barren thread-like colored stamens, which are popularly called the rays. The fruit of several species of passion-flower is filled with a pleasant acidulated pulp, on which account they are eaten as dessert fruit. It is not known that they possess any medicinal properties. The station of the order is not settled; it is undoubtedly very near *Cucurbitaceæ*.

1459 <i>Passiflóra W.</i>	2075 <i>Modécca Lam.</i>
---------------------------	--------------------------

ORDER LXVI. CUCURBITACEÆ.

Here is the station of the gourd, the melon, and the cucumber, succulent climbing vegetables, the fruit of which administers to us many of our comforts and necessities. The importance of the gourd in hot countries is of the highest degree, where, from the nature of the climate, few of those culinary vegetables that are so abundant in the north can be made to succeed. Among these tribes of climbing annuals, the papaw tree is a remarkable deviation from the ordinary character of the vegetation. Its fruit, however, and flowers are in all respects those of *Cucurbitaceæ*. The fruit is mostly sweet, watery, refreshing, and pleasant to the palate; but the *coloquintida* gourd, the spitting cucumber, and the *Trichosánthes amára*, are all possessed of violent bitter, drastic, purgative qualities, which are, indeed, to be found, in a slight degree, even in the mildest of the eatable gourd. M. Decandolle observes, that as the violent action of the *Colocynth* resin is much softened by the mixture with it of gum, it is probable that the difference in the fruits of the order depends upon the different proportions between these two substances. The seeds of the gourd, like those of the

passion-flower, possess none of the properties of the pulp; they are sweet and nutty, and readily form an emulsion. The roots of the bryony are purgative, but also contain a wholesome fecula. It is said that the roots of a species of bryony are eaten in Abyssinia, after being merely boiled. There are some Cucurbitaceæ, the roots of which are intensely bitter; those of one of this description are used in Peru, to remove the pains attendant upon inveterate venereal disorders.

551 Gronóvia <i>W.</i>	2019 Trichosánthes <i>W.</i>	2022 Cúcumis <i>W.</i>	2024 Bryónia <i>W.</i>
1940 Angúria <i>W.</i>	2020 Momórdica <i>W.</i>	2023 Sicyos <i>W.</i>	2025 Cárcia <i>W.</i>
1976 Lúfia <i>Cav.</i>	2021 Cucúrbita <i>W.</i>		

ORDER LXVII. LOASEÆ.

Nothing is known of the qualities of this order. It consists of succulent cut-leaved plants, generally covered with asperities or rigid stinging hairs, and yellow or white flowers. They are all natives of America, and handsome annuals. A very few of them are climbers.

1113 Bartónia <i>Ph.</i>	1194 Mentzélia <i>W.</i>	1619 Loása <i>L.</i>
--------------------------	--------------------------	----------------------

ORDER LXVIII. HALORAGÆ.

Obscure weeds, chiefly distinguished from Onagrarie, by their naked and solitary ovula. They are natives of moist places or ponds, in various parts of Europe and North America. Some of the species of Halorágis are tropical. They are not known to possess any medicinal properties.

23 Hippóris <i>W.</i>	932 Halorágis <i>W.</i>	1987 Myriophýllum <i>W.</i>	209 Ludwígia <i>W.</i>
27 Callitriche <i>W.</i>	1908 Serpicula <i>W.</i>	258 Isnárda <i>W.</i>	

ORDER LXIX. ONAGRARIÆ.

A very well defined order, generally known by its pollen cohering, by a sort of filamentous substance, an inferior polyspermous ovarium, a tetrasepalous tetrapetalous flower, with a definite number of stamens, and a single style. From this form there are some anomalous variations, such as *Circæa* and *Lopéczia*, which are, however, easily reconciled to the usual structure of the order. Most of the genera are pre-eminently beautiful; as *Epilóbium*, *Gnethéra*, and *Fúchsia*, which are old favorites among gardeners. The properties of Onagrarie are little known, and probably very weak. The leaves of *Jussiaea peruviana* are used as an emollient poultice, the seed of *Trápa nátnas* as an eatable nut, and the root of *Gnethéra biennis* as a sort of salad.

71 Circæa <i>W.</i>	903 Epilóbium <i>W.</i>	1026 Jussiaea <i>W.</i>
18 Iopéczia <i>Cav.</i>	904 Fúchsia <i>W.</i>	901 Gnethéra <i>W.</i>
902 Gaúra <i>W.</i>	308 Trápa <i>W.</i>	2064 Montinia <i>W.</i>

ORDER LXX. FICOIDEÆ.

These are all plants with a greater or less degree of succulence; the *Mesembryánthemums* and *Hymenógyne* are well-known dry-stove plants, many of which are beautiful in the highest degree. Of the former of these two, the flowers are of all colors, many of the most vivid hues, and remarkable for expanding only beneath bright sunshine; this phenomenon, indeed, is common to the whole order. *Tetragónia expansa*, *Sesóvium portulacæstrum*, and *Mesembryánthemum edèle*, are excellent substitutes for summer spinach. A large quantity of saline matter is contained in all of them; in *Reaumúria vermiculata*, a substance is secreted, which has been found by chemical analysis to consist of muriate of soda and nitrate of potash. The whole order grows in very dry or saline places, in the temperate regions of the world. Four fifths of the whole are natives of the Cape of Good Hope. The leaves of the different species of *Mesembryánthemum*, offer the most remarkable instances of figure known in the vegetable world.

1090 Nitrária <i>W.</i>	1143 Sesóvium <i>W.</i>	1145 Tetragónia <i>W.</i>	1147 Hymenógyne <i>Haw.</i>
1107 Glinus <i>W.</i>	1144 Aizóon <i>W.</i>	1146 Mesembryánthemum <i>L.</i>	1210 Reaumúria <i>W.</i>

ORDER LXXI. PORTULACÆÆ.

With the exception of *Turnéra*, *Támarix*, *Talinum*, and a few species of *Claytónia*, the whole of this order consists of insignificant weedy plants, of no beauty, and little use. *Claytónia perfoliata* and common purslane, which are occasionally used as salads, being the only species of a useful kind. They are chiefly herbaceous plants, frequenting dry barren situations, or the sea-shore of all parts of the world; all are insipid and inodorous, and destitute, as far as is known, of medicinal properties. Some of the kinds of *Támarix* have an astringent tonic bark, and yield, when burnt, a large proportion of sulphate of soda. *Turnéra* resembles a *Cistus*.

224 Móntia <i>W.</i>	1092 Talinum <i>Haw.</i>	871 Limeum <i>W.</i>	690 Corrigíola <i>W.</i>
537 Claytónia <i>W.</i>	1093 Anacampséros <i>L.</i>	692 Portulacária <i>W.</i>	686 Turnéra <i>W.</i>
689 Teléphiium <i>W.</i>	1036 Triánthema <i>W.</i>	1037 Scleránthus <i>W.</i>	685 Támarix <i>W.</i>
1091 Portuláca <i>W.</i>			

ORDER LXXII. CACTI.

All succulent plants destitute for the most part of leaves, the place of which is supplied by fleshy stems of the most grotesque figure; some angular, and attaining the height of thirty feet, others roundish, covered with stiff spines, like the hedgehog, and not exceeding the stature of a few inches. Their flowers are in many cases large and remarkably specious, varying from pure white to rich scarlet and purple, through all the intermediate gradations of colors. The species are chiefly natives of the hottest and driest parts of the tropics, and are cultivable with little care, in pots filled with rubbish, in a dry-stove. Their fruit is fleshy and watery, and generally insipid, but it is eaten in their native countries for the sake of its refreshing moisture and coolness. Two species of *Opóntia* are hardy in Great Britain. The characters of this order and the next are very similar, although their habit is so widely different. Cacti are sometimes called *Nopaleæ*.

1111 Cactus <i>W.</i>	1112 Rhipsalis <i>Gart.</i>
-----------------------	-----------------------------

ORDER LXXIII. GROSSULACÆÆ.

Distinguished from the last by the definite number of their stamens and woody leafy stems. The equality and excellence of the gooseberry and currant are known to every one. None of the other species equal these, although the fruit of several possesses considerable excellence. The berry of most of these is sweet, watery, and acid, but that of *Ribes nigrum*, and a few more, is tonic and stimulant, which appears to have some connection with the presence of glands upon the leaves of these species.

550 Ribes <i>W.</i>

ORDER LXXIV. SEMPERVIVÆÆ.

Still another order of succulent plants, but with a habit very different from that of those which have gone before. The species are often characterised by the rosulate or densely imbricated arrangement of their leaves, but this is not by any means a universal character. They are natives, for the most part, of dry barren places in Europe, North Africa, and the Cape of Good Hope, and are cultivable with ease in pots of dry rubbish. Many of them have extremely beautiful flowers, especially those of the genera *Sempervivum* and *Crásula*, which are either white, yellow, or deep rose color. Their leaves are used medicinally as refrigerant and abstergent; they are also, in a slight degree, astringent, and in *Sedum acre* so acid, that, taken internally,

they operate violently both as purgatives and emetics. The leaves of *Sédum téléphium* are occasionally eaten as a vegetable, but they are always found to leave behind a slight and unpleasant taste of burning.

1061 <i>Sédum W.</i>	927 <i>Vérea W.</i>	874 <i>Séptas W.</i>	699 <i>Crássula W.</i>
1110 <i>Sempervivum W.</i>	698 <i>Róchea Dec.</i>	1062 <i>Penthórum W.</i>	320 <i>Tillæ'a W.</i>
1060 <i>Cotylédon W.</i>	928 <i>Bryophýllum Sal.</i>		

ORDER LXXV. SAXIFRAGÆ.

The whole of these plants constitute the glory and delight of the cultivator of alpine plants. This is to be attributed to the neatness and perpetual verdure of their leaves, and the exquisite simplicity and elegance of their flowers, rather than to any striking attractions, of which they are wholly destitute: their blossoms being generally white or pale pink, occasionally becoming brownish-purple. All the genuine species are humble herbaceous plants, affecting mountainous situations, but occasionally found in marshes by the sides of springs, and even upon dry walls. All are natives of cold regions, or of the most temperate mountainous situations of hot ones. They are slightly astringent; some of them, as *Heuchéra americana*, eminently so. Infusions of the leaves have been reckoned lithontriptic, and the powdered root of the last-named plant is used with success in cancerous disorders. *Hydránga*, which is shrubby, is not a legitimate inhabitant of the order.

1041 <i>Saxifraga W.</i>	1043 <i>Mitella W.</i>	930 <i>Adóxa W.</i>	1040 <i>Chrysosplénium W.</i>
1442 <i>Tiarélla W.</i>	606 <i>Heuchéra W.</i>	361 <i>Gálax W.</i>	1039 <i>Hydránga W.</i>

ORDER LXXVI. PHILADELPHÆÆ.

This consists at present of a single genus, which was formerly referred to *Myrtacææ*, but which has lately been separated with much acuteness by Mr. Don. The species are hardy ornamental shrubs, natives of North America, with white flowers; in some cases fragrant. Nothing is known of their properties.

1114 *Philadélphus W.*

ORDER LXXVII. CUNONIACÆÆ.

These were formerly included in *Saxifragææ*, from which Mr. Brown first distinguished them. They are shrubs of the southern hemisphere, mostly with pinnated leaves and white flowers. *Callicoma* and *Bauéra*, which have simple leaves, are elegant green-house shrubs. The bark of a species of *Weinmánnia* is employed in Peru for tanning leather, and is said to be also used for adulterating the quinquina. Nothing is known of the properties of the remainder.

------------------------	-----------------------------	--------------------------	--------------------------

ORDER LXXVIII. ARALIACÆÆ.

Araliacææ are a slight divergence from the well-known *Umbelliferaæ*, with which they nearly agree in habit, except in being frutescent, and from which they are obviously distinguished by their 5-celled fruit. Their flowers have no beauty, but the foliage of many is extremely fine, especially of the species of *Actinophýllum*; that of our common ivy must not be omitted. Their medicinal properties are much the same as those of *Umbelliferaæ*, except the fruit, which differs in virtues as it does in botanical structure. Their bark exudes an aromatic gum resin, as in *Aralia umbellifera*. Their roots are tonic, with, in some cases, the flavor of parsnep. The famous ginseng, which is produced by a *Pánax*, is reputed to have powerful tonic, restorative, and even aphrodisiacal qualities; but it is probable that these have been greatly exaggerated.

607 <i>Cussónia L.</i>	697 <i>Actinophýllum R. & P.</i>	1109 <i>Gastónia Juss.</i>
696 <i>Arália W.</i>	549 <i>Hédéra W.</i>	2166 <i>Pánax W.</i>

ORDER LXXIX. UMBELLIFERÆÆ.

One of the least attractive groups of plants, and at the same time one of the most important to the world. They are not more useful as food than they are dangerous as poison; while in their native ditches they are often suspicious lurid weeds, but under the influence of cultivation they lay aside their venom, and become wholesome food for man. They are generally recognised by their hollow stems and cut leaves, with what botanists call a sheathing petiole; that is to say, with a petiole, the base of which wraps round the stem. Their flowers are mostly white or greenish, rarely, as in *Astrantia*, some species of *Caucalis*, and others, of a pink color. The inflorescence is umbellate, and their fruit consists of two ribbed portions, improperly called seeds, which are held together by a common axis, and a thickened discus. All are natives of damp ditches or way-sides, in cool parts of the world; in the tropics they are either extremely rare or wholly unknown, and when present, have generally a character unlike that of our European species. The simplicity of their structure, and uniformity of their appearance, has rendered their classification a matter of very great difficulty. It has been attempted in modern days by Lagasca, Sprengel, and Koch, all of whom have added something to our knowledge; but much still remains to be done. The arrangement of Professor Sprengel, objectionable as it is many points, is here adopted as the most perfect, upon the whole, of any yet published. The culinary and agricultural importance of many species is well known; and the parsnep and carrot form a large part of the staple winter store of the inhabitants of Europe, as the *Arracachas* do of those of South America; and the *Prangos* of Thibet is supposed to be the most important and productive of any in the whole world, as a forage plant. The medicinal properties of *Umbelliferaæ* are not more powerful than they are at variance with each other. While the seeds of some are aromatic, and stimulating in the highest degree, the fresh roots and leaves of others are not less narcotic. This has been supposed to arise from the difference in the state of the sap in different parts of the plant; and it has been thought that the narcotic principle is only to be found in the ascending sap, while the aromatic stimulant properties are found in the juices, which are fully elaborated and matured. It has been already observed, that their dangerous properties are often removed by cultivation; the common celery is a familiar instance of this; but the most remarkable, that of *Ceananthe pimpinelloides*, a most dangerous species when wild, which is cultivated about Angers for the sake of its roots, which are there called *Jouanettes*, and about Saumur, where they are known by the name of *Mémons*. The roots of some *Umbelliferaæ* contain a large proportion of sugar; those of the carrot, when dried, more than an eighth; those of the parsnep just an eighth; and those of the chervil about eight parts in 100. *Galbanum*, *Opopanax*, and *Assafoetida*, are all the produce of different species of *Umbelliferaæ*.

ORDER LXXX. RHIZOPHOREÆ.

The mangroves are plants of arborescent stature, which are remarkable, in tropical countries, for growing upon the shores of the sea, even as far as low water. The seeds have the singular property of germinating, while enclosed within the capsule, and adhering to their parent, and pushing forth a long thread-like radicle, which lengthens till it reaches the soil, where it takes root, and forms a new individual. The bark of *Rhizophora gymnorhiza*, which is very astringent, is used in India for dying black.

1078 *Rhizophora W.*

ORDER LXXXI. HAMAMELIDEÆ.

Hardy American deciduous shrubs, with the appearance of *Amentaceæ*, to which they are undoubtedly closely allied notwithstanding their situation here, which must be considered quite artificial. Nothing is known of their medicinal qualities.

1200 *Fothergilla W.*

312 *Hamamelis W.*

ORDER LXXXII. CAPRIFOLIACEÆ.

This is an eminently beautiful order, consisting either of twining or erect shrubs with clusters of trumpet-shaped fragrant flowers, or of fine bushes having cymes of white blossoms. The honeysuckle is the representative of the former, the dogwood of the latter. Here too is found the modest and delicate *Linnaea*, which, however inferior its attractions for the vulgar eye may be to those of its more ostentatious neighbours, yields to none of them in elegance or interest for the botanist. All the genera have a more or less astringent bark; that of *Lonicera corymbosa* is used in Chile for dying black; that of *Cornus florida* in North America in intermittent fevers, as is also the bark of *Cornus sericea*, which, according to Barton, is scarcely inferior to *Quina*. The Elders are the link between honeysuckles and umbelliferous plants, to the latter of which they are allied by their stinking divided foliage and half herbaceous habit; their flowers are sudorific and soporific in a high degree, their leaves and inner bark are emetics and drastic purgatives. *Triosteum perfoliatum* is intermediate between this order and *Rubiaceæ*, with the former of which it agrees in its purgative, and with the latter in its emetic qualities, which resemble those of *ipecaeuha*. All *Caprifoliaceæ* love shady cool places in both hemispheres; but few have been found in such as endure a very severe climate.

476 <i>Symphória Ph.</i>	292 <i>Linnaea W.</i>	680 <i>Sambúcus W.</i>

ORDER LXXXIII. LORANTHÆÆ.

None of these are cultivable; they are all genuine parasites rooting beneath the bark of the trees on which they grow, and deriving from their juices the whole of their nutriment. The *Viscum* has little or no beauty, but the *Loranthi* are among the most lovely of plants, hanging in clusters of rich scarlet flowers from the branches of trees in the tropics, which they often clothe with a beauty not their own. The mistletoe of the Druids is supposed to have been the *Loranthus europæus*, the common *Viscum* never being seen upon the oak, while the *Loranthus* inhabits no other tree. If this be so, the latter must have once existed in this kingdom although now extinct. It has been suggested, that all vestiges of their religion were exterminated by the Druids, which will account for the *Loranthus* having disappeared wherever that religion formerly held its sway.

2654 *Viscum W.*

ORDER LXXXIV. RUBIACEÆ.

Opposite entire leaves with intervening stipulæ, a monopetalous superior corolla, with a definite number of stamens and a bilocular ovary, are the great characteristics of *Rubiaceæ*; an order of such extent that it embraces a very large proportion of the whole of phænogamous plants, including within its limits humble weeds and lofty trees, plants with important medicinal qualities and flowers of varied dyes, and herbs of neither value nor beauty as far as has yet been ascertained. The sections into which the order has been divided are merely artificial, with the exception of *Stellatæ*, which are the representatives of the order in northern regions. Among these the *Rúbia*, or madder, is the most important on account of its dye; *Galium* also possesses some qualities of minor consequence, which have been already indicated in the body of this work. Among the other sections, the plants of beauty or value are innumerable: of the former description, the genera *Lyra*, *Bouvárdia*, *Catesbæa*, *Portlándia*, *Coutárea*, *Gardéna*, *Mussaúnda*, *Haméilia*, *Cephaélis*, *Cephalanthus*, and many others, are notable examples; to the latter, every genus has a contribution of one kind or another. The root of *Oldenlándia umbelláta* is employed in India for staining nankin; that of *Morinda umbelláta* in the Moluccas, and of *Morinda citrifolia* in India, is used for dying red and brown. The potent febrifugal properties of the *Cinchóna* need not be insisted on; it is less generally known that the bark of *Pimekúeya pubens*, *Macrocórnium corymbósum*, *Guettárdia coccinea*, and *Portlándia grandiflora*, possesses similar, but weaker powers. The bark and roots of *Antirhóa* are used, in the Isle of Bourbon, to stop hæmorrhage; and that of *Morinda Róyoc* is used for ink. Astringent properties of a very marked character are found in the juice of *Náuclea Gámbir* of Hunter, and the *Uncária Gámbir* of Roxburgh, both which are often improperly confounded with *Gum kino*, which is the produce of a very different plant. Some of the species formerly comprehended under the genus *Cinchóna*, but since separated by the name of *Exostémma*, possess strong emetic powers. The same qualities exist in *Psychóttria emética* *Cephaélis*, *Ipecaeuha*,

and *Psychotria herbacea*, which are often used as *ipecauanha*. The seed of the *Coffea* furnishes the valuable beverage which is so much esteemed in Europe and the East, under the name of coffee.

ORDER LXXXV. *OPERCULARINEÆ.*

Exotic weeds, nearly related to *Rubiaceæ*. Their properties are unknown. M de Jussieu has remarked that their affinity to *Valerianæ* is supported by the curious circumstance, that birds devour the young shoots of the *Opercularias* as they do those of the *Corn-salads*.

250 *Opercularia W.*251 *Cryptospermum P. S.*ORDER LXXXVI. *VALERIANEÆ.*

Small herbaceous plants, more interesting for the sake of their symmetry and neatness, than on account of any particular attractions: they may be considered a connecting link between *Rubiaceæ* and *Dipsacææ*. Many of the *Valerians*, and all the *Patrinias*, are pretty plants. The *Valerianellas* are useful esculents, known under the name of *corn-salads*. Their medicinal properties are of a decisive character. The roots of *Valeriana officinalis*, *Phu*, and others, are bitter, tonic, aromatic, antispasmodic, and vermifugal; they are occasionally used as febrifuges. The odour of *Valerian* is not generally agreeable, but the *Orientalis* collect with care, on the mountains of Austria, the roots of *Valeriana celtica*, with which they perfume their baths; and the natives of India, at this day, employ the *Valeriana jatamansi*, the spikenard of old times, as a perfume, and against hysterics and epilepsies.

20 *Centranthus Mich.*
72 *Fedia Dec.*78 *Valeriana W.*
79 *Patrinia W.*80 *Valerianella Dec.*ORDER LXXXVII. *DIPSACEÆ.*

Very nearly akin to *Compositæ*, of which they have nearly the habit. All are herbaceous plants with flowers growing in heads. Some of the *Scabiösas* are very handsome, and popular border flowers. The whole tribe is cultivated with great facility. Some of the species of *Scabiösa* have been employed as diaphoretic and antisyphilitic, but are now neglected.

70 *Morina W.*
262 *Dipsacus W.*263 *Cephalaria Sch.*
264 *Scabiösa W.*265 *Knaütia W.*ORDER LXXXVIII. *CALYCEREÆ.*

Obscure weedy South American plants, differing from *Compositæ*, chiefly in the position of their ovula.

1842 *Acicarpa Juss.*ORDER LXXXIX. *COMPOSITÆ.*

A most extensive and natural order, highly characterized by the cohesion of their antheræ, and the arrangement of their florets in involucreted heads, or calathidia, as they are now called. Most of them may be said to be ornamental plants, and yet but a very few hold that station in the opinion of the public. It is difficult to account for this circumstance, nor is this the place to enter upon such an investigation; certain, however, it is, that with the exception of *Dahlia*, the varieties of *Chrysanthemum sinense*, and a few *Caléndulas* and *Arctótises*, and perhaps *Tagètes*, scarcely a single *Composita* now finds a place in a fashionable flower garden. The prevailing color of the flower in the order is yellow; red, purple, or scarlet, being comparatively uncommon. The species inhabit every part of the world, and in all, perhaps, in nearly equal proportions:—in Europe and the north of the world they are chiefly herbaceous; but within the tropics, they are more frequently frutescent. Their medical properties are very important; *Tussilágo farrara*, *Chamomile*, *Arnica*, *Solidágo Virgaurea*, *Matricaria Parthenium*, *Stévia febrifuga*, and *Eupatórium perfoliatum*, are instances of the presence of tonic and febrifugal properties; *Tanacétum* and *Santolina* are anthelmintic; *Matricaria* and the *Achilleas emmenagogue*; some *Eupatóriums*, *Achilleas*, *Artemisias*, and *Caléndulas*, are sudorific; certain *Liátrises* are diuretic, and *Erigeron philadelphicus* is both sudorific and diuretic. *Pátrnica* and *Arnica* are sternutatory, and *Spilánthes*, *Siegesbeckia orientalis*, *Arthemis pyrethrum*, and others, powerfully excite salivation; finally, many *Achilleas*, *Chamomile*, *Tanacétum*, and *Eupatóriums*, are tonic and antispasmodic. Others seem to possess all these properties combined, and are reckoned among the best alexiterics, as the *Ayapana* of Brazil, and the *Guaco* of Peru. Every one knows the excellent and refreshing flavor communicated to vinegar by Tarragon: the same effects are produced in the Alps by *Achillea nana*, *Artemisia glacialis*, *rupéstris*, and *spicata*. Some species of *Achillea*, *Bellis*, and *Artemisia* have been used as substitutes for tea. The seeds of many *Compositæ*, as *Mádia* and *Verbesina*, yield a copious oil; and the fleshy roots of *Heliánthus tuberosus*, a wholesome food for man. The juice of *Lactuca virósa* is highly narcotic, and has been even employed with extraordinary advantage as a substitute for opium. It is not necessary to mention the utility of the leaves of the lettuce, the endive, the succory, the cardoon, or the roots of *Scorzópera* and *Salsafis*, as culinary productions; they must be familiar to all our readers; as also the fleshy receptacle of the artichoke and some other plants. The flowers of *Echinops strigósus* are used as a kind of tinder; those

of the artichoke, the cardoon, and others, have the power of curdling milk. The arrangement of Compositæ is attended with extreme difficulty; the greatest progress that has yet been made in reducing them to order has been with M. Cassini, by whom they are called Synantheræ; but unfortunately, the remarks of that learned botanist are so scattered and unconnected, that the public has hitherto been able to derive little benefit from his labors. His general arrangement is here adopted, but for the reasons now given, his genera have not been enquired after, as, until they shall have been more completely systematized, the adoption of them would necessarily be full of errors, which would only add to the confusion that already too extensively exists. Those who wish to make themselves masters of this very interesting and difficult branch of systematic botany, should consult the Opuscules phytologiques of M. Cassini, and Mr. Brown's elaborate essay on the structure of Compositæ, in the Transactions of the Linnean Society.

ORDER XC. CAMPANULACEÆ.

These differ from the last in not having the flowers in heads, in their usually distinct antheræ, which are, however, syngenesious in *Lobelia*, in their polyspermous fruit, and also in exuding a milky juice. All the genera are pretty, and some highly ornamental. They are mostly herbaceous, and by far the greater number are extra-tropical, abounding especially in the woods and coppices of the North. The roots of *Campánula Rapunculús* are used as a vegetable under the name of Lampron. The juice of some of the *Lobélias* is highly caustic and inflammatory; when taken internally, producing vomiting and even death: nevertheless, the root of *Lobelia siphilitica*, in small doses, acts as a diaphoretic, in greater quantity as diuretic or purgative, and, if taken in considerable quantities, as an emetic. An infusion of *Lobelia inflata* is used in North America as a remedy for leucorrhœa; and the root of *Lobelia cardinalis* is employed in the same country as a vermifuge.

464 <i>Lobelia W.</i>	466 <i>Trachelium W.</i>	467 <i>Roëla W.</i>	834 <i>Canarina W.</i>
483 <i>Campánula W.</i>	546 <i>Lightfootia L'Her.</i>	545 <i>Cyphia W.</i>	547 <i>Jasione W.</i>
465 <i>Phyteuma W.</i>	895 <i>Michauxia W.</i>		

ORDER XCI. GOODENOVIÆ.

New Holland and South Sea herbs or undershrubs, very nearly akin to the last, from which they differ more in artificial characters than in habit. All of them are pretty, and deserving culture. Nothing is known of their properties.

468 <i>Goodenia R. Br.</i>	470 <i>Dampiera R. Br.</i>	473 <i>Scævola R. Br.</i>
469 <i>Euthales R. Br.</i>	472 <i>Velleia Sm.</i>	

ORDER XCII. STYLIDÆ.

Like the last, the properties of this very small but curious order are, if any, undiscovered. All are inhabitants of New Holland, and either herbs or half-herbaceous shrubs. They have pink flowers, ornamented with glittering glands; their stamens are united into a column, which is terminated by a sessile stigma, and which is irritable in so high a degree, that, if touched with a pin, it instantly starts from its place with great elasticity.

1932 *Stylidium R. Br.*

ORDER XCIII. GESNERIÆ.

Fine tropical herbs, with broad, fleshy, downy leaves, and purple or scarlet flowers. They all require stove heat, and decayed vegetable soil; in their native country, which is chiefly equinoctial America, they are found growing in the woods, where the earth is little more than a bed of rotten leaves and bark.

1290 <i>Gesneria W.</i>	1291 <i>Gloxinia W.</i>
-------------------------	-------------------------

ORDER XCIV. ERICEÆ.

These are distinguished from the neighbouring orders by their polyspermous fruit, aristate anthers, and dry shrubby habit. Every genus is eminently beautiful, and worthy of the most assiduous cultivation. The first tribe is a native of hill-sides and open plains, chiefly of the extra-tropical regions of the earth. Some are famous for their beauty, some for their fragrance, and many for their foliage. The heaths are the glory of the Cape, the *Arbutuses* of Europe, the *Andrómedas* of America, and *Cléthra* of the Canaries. The second tribe is distinguished from the rest by its inferior berry, and is not less valuable for its fruit than conspicuous for its beauty. The species are principally North American. *Monotropeæ* stand in their systematic station as they grow in their native woods, lowly herbs among thickets of bushes and trees. *Rhodoracææ*, once considered a distinct order, are chiefly North American; their flowers are less tubular than those of true *Ericææ*; but their habit is not materially different; here the *Azæla* the *Kálmia*, and the *Rhododéndron*, the pride of European gardens, as they are of their native woods, find their station. The utility of the fruit of *Vaccinium* is well known; its bark is reckoned tonic, stimulant, and astringent, and their fruit slightly styptic. The berries of *Arbutus úva-úrsi* are considered lithontriptic; its leaves have also been employed successfully in infusions in obstinate cases of gonorrhœa. Extract of *Chimáphila umbellata*, in the form of pills, in doses of five scruples a day, has been found successful in cases of dropsy. Some of the species are possessed of narcotic qualities; this is the case with *Lédum*, *Rhododéndron chrysanthum*, and especially *Azæla pónica*; honey obtained from the juice of which is said by Xenophon, to have caused the death of many soldiers in the famous retreat of the ten thousand. An infusion of *Rhododéndron máximum* is used in America in cases of chronic rheumatism, and that of *Rhododéndron ponicum* in Asia, against gout and rheumatism.

SUBCLASS III. COROLLIFLORÆ.

Petals cohering in the form of a hypogynous corolla, which is not attached to the calyx.

To this subclass are to be referred all genera which have a monopetalous corolla, with the stamens inserted into it, and a superior ovary.

ORDER XCV. MYRSINÆÆ.

Showy shrubs, with evergreen undivided leaves, and cymes of white or red flowers. *Theophrásta* is a very rare stove plant, with a simple stem, and undulated spiny toothed leaves. The *Ardisias* are common in collections. None are natives of Europe, but are found in the hot parts of Asia, Africa, and America. Nothing is known of their properties.

408 <i>Theophrásta L.</i>	435 <i>Ardisia W.</i>	443 <i>Bæobótrys Vahl.</i>
409 <i>Clavija Fl. per.</i>	2160 <i>Myrsine R. Br.</i>	

ORDER XCVI. SAPOTEEÆ.

These are also shrubs, which are mostly evergreen, and natives of the warmer regions of the world. Some of the Bumélias are found in the southern states of N. America, but none of the order exists in Europe. They are chiefly valuable for their fruit, which, in many cases, contributes richly to the dessert. *Mimusops elengi*, *Imbricaria malabarica*, *Sideroxylon spinosum*, are all of this description; the star apples of the West Indies, the produce of several species of *Chrysophyllum*, and particularly of *C. cainito*, are esteemed delicious; and the Medlars, Lucumas, and Sapotillas of equinoctial America, all the fruit of different kinds of *A'chras*, are among the most valuable productions of the western world. The seeds of all the order are oily: those of *A'chras sapota* are accounted diuretic and aperient. Their oil is not fluid, but so concrete as to have the appearance and consistence of butter, whence the name of butter-tree has been applied to different species both in Africa and India. The most famous of this description is the Indian mava, mahva, or madhuca, the *Bássia butyracea* of botanists; the seeds of which are so oleaginous, that a single tree has been known to produce three quintals of oil; the dried flowers of the same tree are mixed by some Indians with their food, and a kind of spirit is distilled from them by others. The juice of all the sapotas is milky, but not acrid and poisonous like that of most other lactescens orders, but, on the contrary, yielding a wholesome beverage or food. Here is supposed to belong the famous Palo de Vaca, or Cowtree of South America, the trees of which are regularly milked by the inhabitants of the districts in which it grows. According to Brown, the bark of some of the *A'chras* is so astringent and febrifugal as to be substituted for quinquina.

424 Chrysophyllum <i>W.</i>	427 A'chras <i>W.</i>	881 Mimusops <i>W.</i>	1074 Bássia <i>W.</i>
425 Sideroxylon <i>W.</i>	433 Sersalsia <i>R. Br.</i>		

ORDER XCVII. SYMPLICACEÆ.

Shrubs with serrated leaves, turning yellow in drying, and small white flowers which are sometimes fragrant. The leaves of most of them are astringent; those of *Alstónia* tinge the saliva greenish yellow, of *Symplocos tinctoria* are used in America under the name of Sweet-leaf, for dying yellow.

1614 *Symplocos L.*

ORDER XCVIII. EBENACEÆ.

Some of these are hardy trees or shrubs, with deciduous leaves and white flowers, natives of woods, mountains, and banks of streams in North America and Europe; others are tropical evergreens. Among the former, the best known are the Snow-drop tree, or Halési, with pendent shewy white blossoms; and the different species of *Styrax*: of the latter, many of the *Diospyruses'* produce are eatable fruit; as, for example, the Mabolo of the Philippine Islands, which is as big as a peach, and the Kaki of Japan, which resembles an apricot. All these fruits are remarkable for their extreme austerly before maturity, and the necessity of letting them decay, like our medlars, before they are fit for table. These are also distinguished for the excessive hardness of their wood, and for the black colour it sometimes acquires when old, as the Ebony. The bark of *Diospyros virginiana* is used in North America in intermittent fevers.

1035 Royéna <i>W.</i>	2159 Diospyros <i>W.</i>	1081 Halésia <i>W.</i>
2086 Mába <i>J.</i>	1025 Styrax <i>W.</i>	1105? Visnea <i>W.</i>

ORDER XCIX. OLEINÆ.

The olives are known by their monopetalous corolla, with a valvular æstivation, two stamens alternate with the segments, a bilocular ovary with no discus at the base, and pendulous collateral ovula. They were formerly combined with the jasmynes. They have all simple opposite leaves; their flowers are either white, yellow, or purple, and frequently fragrant. The *Phillyréas* are among our finest evergreens, and the *Lilac* or *Syringa* perhaps at the head of hardy deciduous bushes. The ash is an anomalous genus which hardly belongs to the order. The seed of the olive contains so large a proportion of fixed oil, that it has long been one of the most important objects of cultivation in the South of Europe. The bark and leaves of many *Oleinæ* are bitter and astringent; these properties are particularly apparent in the ash, which has often been employed successfully as a febrifuge. From the exudation of many species of that genus, the mild purgative called manna is formed; it is most commonly found upon the *O'rnus*. M. Decandolle remarks, that in proof of the natural affinity of the plants here combined, and of the propriety of separating the jasmynes from them, it has been found that all the olives as now restricted, will bud or graft upon one another, but not on the jasmynes. Thus the lilac will graft on the ash, the *Chionánthus*, and the *Fontanésia*, and even upon *Phillyréa latifolia*, and the olive will take upon the *Phillyréa*, and even on the ash.

33 Phillyréa	36 Ligustrum <i>W.</i>	66 Fontanésia <i>W.</i>	2157 Fráxinus <i>W.</i>
35 Notelæa <i>E. P.</i>	37 Syringa <i>W.</i>		

ORDER C. JASMINEÆ.

Fragrance is the predominant property of the jasmine, and has made it for ages the favourite of poets and of the people; this arises from the presence of an oil which can be extracted so as to retain its perfume. In medicinal qualities, the jasmynes do not differ materially from the last; they are neatly distinguished by botanists by the direction of their ovula which are erect in *Jasmineæ*, and pendulous in *Oleinæ*.

38 Nyctánthes <i>W.</i>	39 Jasinum <i>W.</i>
-------------------------	----------------------

ORDER CI. APOCYNEÆ.

We now turn from the contemplation of plants endued with mild and agreeable properties and fragrant flowers, and often bearing food for man, to others which are among the most dangerous and fatal poisons; whose juices, milky indeed, like the Cowtree, are not a wholesome and delicious beverage like those of *Sapotææ*, but on the contrary acrid, caustic, or bitter. They are readily known by the twisted direction of the segments of the corolla, which have been compared to the rays of a Catherine's wheel, whence they were called by *Linnaeus*, *Contortæ*. By far the greatest part of the order consists of tropical trees and shrubs: a few *Apocynums*, *Ansonias*, and *Vincas*, are natives of the colder zones of the earth. Many are elegant climbers, as the different species of *Echites* and *Melodinus*. The splendid *Oleánder* belongs to *Nérium*; the different species of *Plumieria*, *Camerária*, *Strophánthus*, and *Arduina* are stove plants of the greatest beauty. The medicinal action of these plants is highly powerful. The *Strychnos*, or nux vomica tree, is remarkable for its bitterness and acrid deleterious effects, which are indicated not only when introduced into the stomach, but still more violently when absorbed into the system by inoculation. In general, the *Apocynææ* are acrid, stimulating, and astringent; these principles, when in excess, act so powerfully on the nerves as to produce stupefaction. The root of *Ophióxylon* is very bitter and purgative; under the name of snake-root it is used in India as an antidote to the bites of serpents. The bark of *Cérbera Mánghas* is purgative; of *Echites* antidiarrhetic, and the *Wrightia* of the same name, astringent and febrifugal; the leaves of the *Vinca* are so astringent, that they have been used successfully in tanning; those of *Nérium oleánder* are said to abound in free gallic acid. The inspissated juice of a species of *Cérbera*, known in Mexico under the name of *Ycotli*, is a fatal poison.

419 <i>Amsónia Mich.</i>			

ORDER CII. ASCLEPIADEÆ.

These differ from the last only in having the stamens united into a sort of fleshy crown, and the pollen coherent in masses of a waxy substance like that of Orchidææ; their properties, habit and geographical range, are much the same. *Periplœca* is a singular instance of an asclepiadeous plant being a hardy shrub, every other frutescent species of the order being natives of countries where frost is unknown. *Hoſa* comprehends climbing plants, with waxy, clustered, odoriferous flowers distilling honey. *Pergularia* is valued for its fragrance, *Ceropégia* for its singularity, and *Asclépias* for beauty and hardiness. But the most extraordinary genera of the order are *Stapélia*, *Piaránthus*, and *Huérnia*, in which the place of leaves is supplied by fleshy short stems of various forms, and whose flowers are not less singular for their curious and complex organization, than they are remarkable for their strange coloring and spotting, and offensive for their odor. The root of *Gymnéma vomitória*, *Asclépias curassávia*, *Calótropis prócera*, and some others, is employed in different countries for ipecacuanha. An infusion of the root of *Asclépias decumbens* has the singular property of exciting general perspiration; whence it is successfully used in Virginia for pleurisy. It is very singular that, in a tribe of plants so generally poisonous as these are, the young shoots of some species should be an article of food: of this nature are *Pergularia edulis*, *Periplœca esculénta*, *Apócynum indicum*, and several more.

580 <i>Dæmia R. Br.</i>			

ORDER CIII. GENTIANÆÆ.

An order in some degree intermediate between Polemoniaceæ and Scrophularinææ, from both which it is distinguished both by habit and fruit; some of the genera border closely upon Apocynææ. The species are natives of cool or mountainous regions or pools in all parts of the world. The Gentians are mostly dwarf herbaceous plants, with deep blue flowers; the latter color, and different shades of orange, being the prevailing hues. They are all pretty, and many beautiful in the highest degree; but, with a few exceptions, they are impatient of cultivation. The medicinal properties of the root of *Gentiana lítea*, *rúbra*, and *purpúrea*, are eminently tonic, stomachic, and febrifugal; their bitterness is second only to *Quássia*. Similar, but more feeble virtues, are found in most of the order, especially in *Villarsia ovata*, *Gentiana peruviána*, *Chirayita*, *Fraséra Walteri*, &c. *Spigelia anthelmíca* is used as a vermifuge; and the root of *Spigelia marylandica* infused in water as anthelmintic, and in wine as febrifuge. *Potálma amara* is used in Guiana as an emetic. A kind of spirit is distilled in Switzerland from the roots of *Gentiana*, macerated in water.

364 <i>Chironia L.</i>	894 <i>Chlora W.</i>	378 <i>Lisíanthus W.</i>	363 <i>Villarsia R. Br.</i>

ORDER CIV. BIGNONIACEÆ.

The showy trumpet-shaped flowers and broad leaves of these plants, render them objects of general admiration. The greatest number is found in the equinoctial regions, a few only passing beyond those limits to the north. *Bignonia rádicans* is a hardy climbing plant, of exceeding beauty; and the *Jacarândas* are resplendent with flowers of blue or purple, and leaves which emulate the elegance of the *Acácia*. Nothing important is known of their qualities. Their wood is said to resist the attack of worms.

64 <i>Catálpa Juss.</i>	1294 <i>Bignónia W.</i>	1295 <i>Jacarânda Juss.</i>
-------------------------	-------------------------	-----------------------------

ORDER CV. COBÆACEÆ.

A climbing genus with large purple flowers, recently separated from the Bignónias by Mr. Dou. Nothing is known of its medicinal properties.

388 *Cobæa Cav.*

ORDER CVI. POLEMONIACEÆ.

Herbaceous plants with showy blue, red, or white flowers, and often with pinnated leaves. They are natives of cool or mountainous parts in Europe and America. Nothing is known of their properties.

369 <i>Phlox W.</i>	70 <i>Polemónium W.</i>	389 <i>Cántua W.</i>	390 <i>Hoitzia Cav.</i>
---------------------	-------------------------	----------------------	-------------------------

ORDER CVII. CONVULVULACEÆ.

Nearly the whole of these are twining plants, with showy flowers expanding beneath the influence of bright sunshine. A few are shrubs, but the greater part are herbaceous, and very many annual. They are frequently, also, weeds, which, from their creeping roots, are difficult to extirpate. All parts of the world produce them, from the cold regions of the north to the burning soil of the equator. *Cúscuta* is a singular parasite, wholly destitute of leaves. The root of many is filled with a milky acrid juice, which is very purgative. Scammony, jalap, and some other drugs, are the produce of *Convulvulacææ*. The root of *Convulvulus fóridus* and *scopárius*, and *Ipomæa quanaélit*, is stimulatory; that of *Convulvulus batatas*, which is the sweet potato of America and Southern Europe; and *Convulvulus edulis* are wholesome articles of food.

Hydroleææ are little known, pretty, herbaceous plants, mostly with blue flowers, native both of cold and tropical countries; *Diapénsia lappúnea* being an inhabitant of Lapland mountains, and *Hydroleæa spinósa* of West Indian marshes. Their botanical characters are very nearly the same as those of *Polemoniaceææ*. The roots of *Hydroleæa spinósa* are reputed bitter, and slightly purgative.

Tribe 2. HYDROLÆÆ.

601 <i>Hydroleæa W.</i>	358 <i>Diapénsia W.</i>	359 <i>Pyxidanthéra M.</i>
-------------------------	-------------------------	----------------------------

ORDER CVIII. BORAGINÆÆ.

True Boraginææ are chiefly herbaceous plants, with alternate exstipulate leaves, the surface of which is covered over with minute asperities, and with flowers arranged in one-sided spikes or racemes, occasionally solitary. Each flower has also four distinct little nuts or seeds, as they are commonly called. Some *Echiums*

and a few more are shrubs. They are found abundantly in Europe, Siberia, and the North of Africa, less commonly in India, and the equinoctial parts of the world; in some quantity in North America, and in tolerable abundance in New Holland. Within the tropics the order is principally represented by *Heliotrópiums* and *Tournefórtias*; in colder latitudes by *Anchúsas*, *Cynoglóssums*, herbaceous *Echiums*, and the like. Some are mere weeds, quite unworthy of culture; others are eminently beautiful, as many *Echiums*, *Onósmas*, *Onosmódiums*, *Symphytums*, and others. In general they are mucilaginous and emollient, qualities which are especially abundant in the root of *Symphytum* and *Cynoglóssum*. Pure nitre has been found in several plants of the order. A red color is given out by *Anchúsa tinctoria*, *Lithospérmum tinctorium*, and *Onósmas echioides*, which is used in dyeing. Several plants are employed on the same account in America. The *Hydrophyllæ* are often considered as distinct, on account of their capsular fruit and cartilaginous albumen. One or two of these are pretty plants, but most of them mere weeds.

Tribe I. ASPERIFOLIÆ.

316 <i>Coldénia W.</i>	330 <i>Lithospérmum W.</i>	336 <i>Cynoglóssum W.</i>	342 <i>Asperúgo W.</i>

Tribe 2. HYDROPHYLLÆ.

372 <i>Hydrophyllum W.</i>	373 <i>Phacéilia Mich.</i>	386 <i>Nemóphila Nutt.</i>	432 <i>Ellisia W.</i>
----------------------------	----------------------------	----------------------------	-----------------------

ORDER CIX. CORDIACEÆ.

Trees formerly referred to the last order, from which their habit, plaited cotyledons, and dichotomous style divide them. Little is known of their properties, except that the flesh of their fruit is emollient and mucilaginous. The nuts of *Cordia Sebesténa* are employed sometimes as laxatives.

428 <i>Córdia W.</i>	429 <i>Varrónia W.</i>	430 <i>Ehrétia W.</i>	431 <i>Bourrécia Gert.</i>
----------------------	------------------------	-----------------------	----------------------------

ORDER CX. SOLANÆÆ.

The baneful nightshade represents this order, which participates very generally in its qualities, although they are frequently hidden beneath a fairer form, and often much mitigated. Many of the *Solanums* are very handsome. The *Verbásiums*, *Datúras*, and *Solándras* are all plants of great beauty, although the former, on account of their frequency, are despised in gardens. *Cápsicum* are famous for their pungent fruit and seeds; *Brunsfélias* for their fragrance, and *Nicotianas*, or *Tobacco*, for their fetor. The leaves indeed of the whole order are disagreeably scented. The usual effect of *Solanæ* is narcotic; but it is thought that this has been exaggerated, on account of the intense and deleterious properties of *A'tropa belladóna*. These, according to the observations of *Vauquelin*, depend upon the presence of a bitter nauseous matter which is soluble in spirits of wine, forming with tannin an insoluble compound, and giving out ammonia when decomposed by fire. Notwithstanding the narcotic power of the roots of the *Mandrake*, the *Belladóna*, and others, those of the potato are found to contain an abundant fecula, which is among the most valuable food of man. The leaves of many *Solanæ* are exciting and narcotic, but in very unequal degree, as in *Tobacco*, *Phýsalis*, *Henbane*, &c.; those of the *Nightshade* excite vertigo, convulsions, and vomiting. The juice of *Stramónium* is given in North America, in doses of from twenty to thirty grains, in cases of epilepsy. The fruit of *Phýsalis Alkekéngi* is a veterinary diuretic; that of *P. éduilis* is used in tarts; that of *Solanum Lycopersicum*, and *Melongo*, is served at table in various forms, under the name of *Tomatoes* and *Aubergines*.

380 <i>Niándra J.</i>			

ORDER CXI. OROBANCHEÆ.

Leafless parasites on roots, with brown or colorless scaly stems and flowers.

1335 <i>Orobánche W.</i>	1339 <i>Lathraea W.</i>
--------------------------	-------------------------

ORDER CXII. SCROPHULARINÆÆ.

A great part of *Linnaeus's* *Didymna Angiospermia* is found here, capsular fruit and didynamous stamens being among the most obvious characteristics of the order. The species are generally herbs with opposite leaves, very rarely shrubs; and natives of mountains, valleys, ditches, woods, and waysides, in all parts of the world. The *Personatæ* have the palate so prominent as to close up the orifice of the corolla. *Ringentes* have the palate open. Some are highly ornamental, as *Digitális*, *Pedicularis*, *Calceolária*, &c., others are mere weeds, as is the case with a large proportion of them. Most of them have a weak unpleasant smell, a bitterish taste, and acrid and suspicious properties; but this odor is sweet and aromatic in the *Ambúlia* of *Lamarck*; the taste is refreshing in *Minulus léuteus*, which is a culinary plant in Peru, and the ordinary acrid properties become emollient in some *Antirrhinums*. The *Rhinanthaceæ* are remarkable for their astringent tonic bark and leaves. The leaves and roots of *Scrophularia aquática*, *Griatiola officinális* and *peruviána*, and *Calceolária*, act as purgatives, or in strong doses produce vomiting; these properties exist, in a high degree, in *Digitális purpúra*. The leaves of this plant, reduced to powder, excite vomiting and vertigo, excite urine and saliva, and lower the pulse: in too strong doses they cause death; in moderate doses they are useful in scrophula, dropsy, asthma, &c.

Tribe 1. PERSONATÆ (OF RHINANTHACEÆ).

Tribe 3. MELAMPYRACEÆ.

1315 Melampýrum *W.*

ORDER CXIII. LABIATÆ.

A portion of *Diandria* Monogynia, and the whole of *Didynamia* Gymnospermia of Linnæus, make up Labiate, which are characterized by their didynamous stamens, four little nuts or naked seeds, single style, and irregular corolla. They are mostly natives of extra-tropical countries, although under the form of *Hýptis*, *Anisomèles*, *Leucas*, *O'cymum*, &c., and they are found in the hottest zones of the world. Many are extremely odoriferous in the leaves, some bear handsome flowers, but by far the greater part are no better than weeds. They are all remarkable for their tonic, cordial, and stomachic virtues: they contain both a bitter and an aromatic principle, in different proportions. The bitterness which is given out in decoctions, resides in a gum-resinous secretion, abounding in some *Teucriums*, which are particularly employed as stomachics, and sometimes as febrifuges: those which abound in essential oil, and which are consequently aromatic, are used as stimulants. From the different degree of combination of these principles in different plants, they have obtained various uses; such as savory, thyme, marjoram, for seasoning of food; sage, balm, ground ivy for tea; marum, marjoram, lavender, and thyme, for sternutatories; others, such as lavender, mint, balm, and rosemary, for perfumes. It is a remarkable fact, that the essential oil of all contains camphor, which exists in such quantity in sage and lavender, that it has been supposed that the separating of it might become an object of commerce.

ORDER CXIV. PEDALINÆ.

Herbaceous plants, formerly included in *Bignoniaceæ*, from which they are distinguished by the small number of seeds in each cell of the fruit. Natives of the tropics, with showy trumpet-shaped flowers. The seeds of *Sésamum* abound in oil, which is easily expressed, for which the common species is extensively cultivated in hot countries.

1296 <i>Sésamum W.</i>	1300 <i>Martýnia W.</i>	1331 <i>Pedálium W.</i>
------------------------	-------------------------	-------------------------

ORDER CXV. MYOPORINÆÆ.

South Sea and New Holland shrubs, with scarcely any hair. The leaves are simple, alternate, or opposite, with no stipule. The flowers, scarlet, white, or blue, axillary without bractæ. These are very near *Verbenaceæ*. *Stenochilus* is the handsomest genus of the order; the *Avicénnias* are shore plants, growing in the place of the mangroves, and shooting their long roots to a great distance among the mud, sometimes to the length of six feet along the surface before they fix themselves. Their medicinal properties, if any, are unknown.

1323 <i>Avicénnia L.</i>	1332 <i>Myopórum Forst.</i>	1333 <i>Stenochilus R. Br.</i>	1334 <i>Böntia R. Br.</i>
--------------------------	-----------------------------	--------------------------------	---------------------------

ORDER CXVI. VERBENACEÆ.

A mixture of weeds and showy herbs, of humble creeping plants and of lofty timber trees. Some of the *Vitex* and *Clerodéndrums* are handsome shrubs: *Aloýsia* is esteemed for the fragrance of its flowers, and *Holmskiöldia* for the refulgent scarlet of its enlarged calyxes. *Téctona* produces the famous Indian teakwood. No properties of consequence have been attributed, by medical men, to any plant of the order, those formerly ascribed to the vervain and chaste-tree being now disregarded. The species are natives of waysides in Europe, and of woods and barren plains in the tropics.

1322 <i>Verbéna L.</i>	274 <i>Égiphila W.</i>	1313 <i>Aloýsia Fl. per.</i>	1325 <i>Clerodéndrum B. P.</i>

272 <i>Callicárpa W.</i>	1318 <i>Cornútia W.</i>	1324 <i>Caldásia W.</i>	1330 <i>Duránta W.</i>
65 <i>Ghinia W.</i>			

ORDER CXVII. ACANTHIACEÆ.

These are known by the elastic dehiscence of their capsules, and the hooked processes of the seeds. They are almost entirely tropical herbs or shrubs, with the pubescence, if any, simple or capitate, but never stellate. Their leaves are opposite, occasionally arranged in fours, simple and undivided, or very seldom lobed. The flowers are either in imbricated heads or open racemes, always enclosed in their bractæ; and are white, blue, yellow, scarlet, or purple. Some of the species are very showy, but few of them are cultivated commonly; a large proportion are mere weeds. The *Thunbérrias* are fine climbers, and the *Acánthus mollis*, the foliage of which gave rise to the classical acanthus of architecture, is, perhaps, except *Morina persica*, one of the most interesting of hardy herbaceous plants. It is also one of the few species to which any medical properties are ascribed, being used sometimes as an emollient by reason of its mucilage. *Justicia biflora* is employed in Egypt as a poultice, *J. Ecbolium* as a diuretic, and *J. pectoralis* as a vulnerary.

45 <i>Elytrária M.</i>	49 <i>Eránthemum P. B.</i>	1304 <i>Ruéliia J.</i>	1306 <i>Apheláundra R. Br.</i>

48 <i>Dicliptera W.</i>			

ORDER CXVIII. LENTIBULARIÆ.

Very pretty interesting aquatics, which are scarcely susceptible of cultivation, except in a few cases. The *Pinguiculas* are either European or North American, inhabiting elevated patches in bogs: the *Utriculárias* are floaters, found in most countries in marshes and little rills: their flowers, are white, yellow, or blue.

52 <i>Pinguicula W.</i>	53 <i>Utriculária W.</i>
-------------------------	--------------------------

ORDER CXIX. PRIMULACEÆ.

Beautiful dwarf herbs, inhabiting the mountains and meadows of all parts of the world, but especially in the northern hemisphere. Nothing can be more lovely than the little delicate alpine Primulas, Androsaces, Arétias, and Sotlaúellas, with their little modest blossoms, sometimes rivaling the whiteness of the surrounding snow, sometimes emulating the intense blue of the empyrcan, as if the one had borrowed its hues from heaven, and the other from the spotless mantle of the earth. Hottónia is a naiaid of the stream, inhabiting several parts of England, in ponds and ditches, which are enlivened for many a month with its rosy flowers, peeping from among the sedge and under grass, by which it is environed. All the genera are familiar to gardeners, except Centúnculus and Schwénckia, of which the former is singular in the order, as being an obscure minute weed, and the latter has inelegant green flowers, curious to the botanist but ungrateful to the florist. The prominent botanical character is the one-celled fruit, with a central placenta, and the stamens opposite the petals. The properties of Primulaceæ are feeble and of little consequence; they appear to be slightly astringent and bitter; the root of Cýclamen is acrid, and only eaten by wild boars; the flowers of the primrose and cowslip are fragrant, and mildly sudorific and soporific. Cortúsa Matthiola has been used in nervous disorders.

350 Primula <i>W.</i>	352 Soldanólla <i>W.</i>	356 Lysimáchia <i>W.</i>	277 Centúnculus <i>W.</i>
349 Androsáce <i>W.</i>	353 Dodecátheon <i>W.</i>	392 Lubinia <i>Comm.</i>	42 Schwénckia <i>W.</i>
348 Arétia <i>W.</i>	354 Cýclamen <i>W.</i>	357 Anagállis <i>W.</i>	471 Samólus <i>W.</i>
351 Cortúsa <i>W.</i>	355 Hottónia <i>W.</i>	360 Córís <i>W.</i>	862 Trientális

ORDER CXX. GLOBULARINÆ.

Pretty alpine plants with blue flowers. The leaves of Globularia Alypum are very bitter and powerfully purgative, giving at the same time a tone to the stomach and intestines.

260 Globulária *W.*

ORDER CXXI. PLUMBAGINEÆ.

These are properly placed at the limit between Monochlamydeæ and Dichlamydeæ, to either of which they are referable in the minds of some botanists, although it appears, upon the whole, to be most convenient to station them where they are now arranged. They are low shrubs or herbaceous plants, with shewy red or blue flowers of an arid texture, inhabiting salt marshes and subalpine tracts, in the temperate latitudes of both the northern and southern hemispheres. All the Státices and Armérias are fine plants worth cultivating. The root of Státice Limónium is astringent and tonic; of the Plumbágos, the root and whole plant are acrid and caustic, and employed as vesicatories.

324 Plumbágo <i>W.</i>	705 Arméria <i>W. en.</i>	706 Státice <i>W. en.</i>
------------------------	---------------------------	---------------------------

SUBDIVISION II. MONOCHLAMYDEÆ.

Perianthium simple.

The absence of corolla characterizes this subdivision of dicotyledonous vegetation; but as the term corolla is subject to frequent misunderstanding, it should be borne in mind, that whenever there is only one floral envelope, that envelope is to be considered calyx, whether green, as in most cases, or colored, as in the Marvel of Peru.

ORDER CXXII. PLANTAGINEÆ.

Little inconspicuous herbs found in waste places all over the world. The leaves are stellate, and occasionally ternate; the pubescence is jointed; the flowers are brownish, and arrayed in dense spikes. Their leaves are rather bitter and astringent; their seeds mucilaginous and rather acrid; those of Plantágo arenária are imported in large quantities from the south of France, for the purpose of forming an infusion in which mustins are washed. P. média is sometimes cultivated by farmers under the name of ribgrass.

278 Plantágo <i>W.</i>	1967 Littorélla <i>W.</i>
------------------------	---------------------------

ORDER CXXIII. NYCTAGINEÆ.

With the exception of Mirábilis, in which the colored calyx has a shewy effect, all the order consists of weeds, growing often among the loose sand on the sea coast of the tropics and western hemisphere; none are found in Europe. The Abrónias are curious, neat, and often fragrant. The root of Mirábilis Jalápa was formerly considered the jalap, which is now known to be an error; it is however purgative, although in a less degree. Boerhaávia tuberósa is also a reputed purgative.

19 Boerhaávia <i>W.</i>	81 Calyménia <i>R. P.</i>	322 Mirábilis <i>W.</i>	523 Abrónia <i>Juss.</i>	864 Pisónia <i>W.</i>
-------------------------	---------------------------	-------------------------	--------------------------	-----------------------

ORDER CXXIV. AMARANTHACEÆ.

Upon this order Dr. von Martius has the following remarks: Leaves, especially when young, of a lax soft texture, abounding in saccharine, mucilaginous, and fibrous particles, and therefore fit for food. The seeds are farinaceous, consisting chiefly of starch and mucus. Their virtues are nutritive, emollient, demulcent; the root of Gomphréna officinális is tonic and stimulant. The species are either gregarious or solitary; mostly diffuse and villous, and existing in dry stony exposed places, or erect and reclining on other vegetables, with little pubescence, when found on the skirts of ancient forests; a few are found in saline coast places. Finally, they are more common in low land, little elevated above the surface of the sea, than in mountainous regions. They are met with in both hemispheres; rarely under the equator, but increasing both northwards and southwards as we recede from them; they are confined to no countries in particular, but are found to affect all regions of the world. Among an abundance of weeds, we distinguish a few fine plants deserving cultivation, as the Globe Amaránthus, the Cockscombs, and a few species of Amaránthus, one of which, under the name of Love-lies-bleeding, is commonly reared for the sake of its long, tail-like, pendent masses of crimson flowers. Amaránthus oleráceus, and a few others, are occasionally cultivated as potherbs.

ORDER CXXV. ILLECEBREÆ.

Weeds distinguished from Amaranthaceæ by their membranous stipules. They are found in dry barren places, for which they are better fitted than for a garden, unless as objects of curiosity.

555 Illecébrum <i>Juss.</i>	569 Mollia <i>W.</i>	82 Loéflingia <i>W.</i>	226 Minuártia <i>W.</i>
557 Paronýchia <i>Juss.</i>	614 Herniária <i>W.</i>	221 Polycáron <i>W.</i>	227 Quéria <i>W.</i>
559 Anýchia <i>Mich.</i>			

ORDER CXXVI. CHENOPODEÆ.

The habit of this order is a better distinction from Amaranthaceæ, than any artificial character which it is easy to point out. While Amaranthaceæ have a dry perianthium with a dense inflorescence, Chenopodeæ on the contrary have a fleshy perianthium and a very effuse inflorescence. In the former, the stamens are usually

inserted under the ovarium; in the latter into the calyx, but this mark is not constant. None of them, unless *Phytolacca* is excepted, can be esteemed plants of ornament; on the contrary, they have a weedy unwhitening appearance, which is not improved by the fetid smell of some of them. But, although their appearance is less attractive than that of the *Amaranths*, their use to man is far more considerable. Their qualities are very various; *Camphorosma* has the smell of camphor; *Petivéria* stinks like onions; *Phytolacca* roots, leaves, and berries, are violent purgatives and emetics; the latter are esteemed in North America nearly equal to *Guaiacum*, and are employed in chronic rheumatism, and in rheumatic pains following venereal diseases; an extract of the berries has been employed in scrophula and cancerous ulcers; and the young shoots of the plant are eaten in the United States as asparagus. Some of the *Chenopodiums*, as *Ambrosioides*, *Bötrys*, &c., possess antispasmodic and tonic properties; the leaves of *Spinacia*, and of many *Chenopodiums*, are eaten as spinach; as are those of *Basella* in China and India. *Salsola* and *Salicornia* are often employed as pickles. Beet roots are equally valuable as a culinary and agricultural production, and the leaves are an excellent vegetable when boiled. But the most remarkable feature in the properties of the order is the abundant production of soda, which is obtained from many of the species, as from all the *Salólas*, *Salicornias*, *Anabasis*, many species of *Atriplex*, several salt marsh *Chenopodiums*, and others. The seeds of *Chenopodium anthelminticum* are used as a vermifuge, those of *Atriplex hortensis* excite vomiting, frequently attended with acute pain; those of *Chenopodium quinóla* are said to be used as rice. To conclude this list of remarkable properties in one of the most vile of all assemblages of plants, the roots of beet yield an abundance of sugar.

612 <i>Béta</i> <i>W.</i>			

ORDER CXXVII. POLYGONEE.

Herbaceous or suffrutescent fleshy-leaved plants, chiefly natives of the northern hemisphere; a few *Polygonum* and *Coccolóbas* are found to the south, the former in barren places, the latter on sea shores. A great part of the order consists of worthless weeds. Some of the *Polygonums*, and all the *Eriogonums*, are handsome plants; the *Rhéum* are famous in medicine. The root of *Rhéum* is tonic and purgative; most of the *Rúmxes* and *Polygonums* are also tonics. The juice of the *Coccolóbas* is very astringent. The young leaves and shoots of several species of *Rúmxes* and *Rhéum* are eaten either raw or baked, under the name of sorrel, French sorrel, and tart rhubarb. For the sake of its seeds, *Polygonum Fagopyrum* is cultivated by farmers under the name of buck-wheat; the seeds of *P. aviculare* are very emetic and purgative. The fleshy calyx of the *Coccolóbas* is colored; and, the fruit growing in clusters, the genus has received the name of the sea-side grape.

228 <i>Koenigia</i> <i>W.</i>	857 <i>Oxýria Dec.</i>	937 <i>Eriogonum</i> <i>W.</i>	1106 <i>Calligonum</i> <i>W.</i>

836 <i>Rúmxes</i> <i>W.</i>	922 <i>Coccolóba</i> <i>W.</i>	1052 <i>Brunnichia</i> <i>W.</i>	

ORDER CXXVIII. BEGONIACEE.

The acid qualities, sheathing stipules, and alternate leaves of these tropical herbs approximate them to *Polygonace*, notwithstanding the very different structure of their fructification. Most of the species are pretty, some very handsome; all requiring great heat and humidity to be grown in perfection.

1989 *Begónia* *W.*

ORDER CXXIX. LAURINEE.

Noble trees or shrubs with handsome foliage and inconspicuous flowers. They are chiefly natives of hot countries, where they constitute some of the most valuable of the productions known under the name of spice. By botanists they are readily recognized by the singular circumstance of their anthers having each four cells, the valves of which are hinged as it were to the upper edge of each cell, and do not open longitudinally like those of most other plants. It is well known that the cinnamon is the produce of the *Laurus cinnamómum*, and that its properties are eminently aromatic, warm, and stomachic. The same peculiarities, but in a less degree, exist also in *Laurus cassia*, *L. malabáthrica*, and *L. culilában*, which are all occasionally substituted for true cinnamon; they are found in the leaves of *Laurus parvifolia*, in the bark of the species which produces the *Picubium* bean; in that of *L. cupularis*, which is the *Isle of France* cinnamon; of *L. quixos*, which yields the *Peruvian* cinnamon; in *L. Benzoin*, which was used as spice in the United States during the American war; and finally, in the common bay tree of our plantations. *Laurus sassafras* yields the *sassafras* chips of the shops, but its bark is much more powerful. The fruit of many *Laurinee* are extremely aromatic; that of *Laurus Persca* is an agreeable West Indian fruit, called the *alligator pear*. *Camphor* is the produce of *Laurus cámphora*, and of another or two; this substance is found indeed in small quantities in the roots of almost all the order; one of the cinnamons is even named *Capuru Carundu*, which signifies camphorated cinnamon.

934 <i>Laurus</i> <i>W.</i>	935 <i>Cassýtha</i> <i>W.</i>	1942 <i>Hernándia</i> <i>W.</i>	1077 <i>Agathophýllum</i> <i>W.</i>
-----------------------------	-------------------------------	---------------------------------	-------------------------------------

ORDER CXXX. MYRISTICEE.

Closely allied to the last, especially in sensible properties. The arillus of *Myristica* is the mace of the shops, and its nut, the famous nutmeg. It is well known that this abounds with oil; in *Viróla sebifera* the oily secretion is so copious, that it is readily separated by immersion in boiling water under the form of fat.

2120 *Myristica* *W.*

ORDER CXXXI. PROTEACEE.

Favorite shrubs with gardeners, both on account of the neatness of their foliage and the beauty of their flowers. With very few exceptions, they are confined to the southern promontory of Africa, and to New Holland, where they adorn large tracts of country. They are shrubby or arborescent plants with an arid habit. The leaves are simple, evergreen, narrow, entire or serrated. The flowers generally grow in clusters, and are green, yellow, or red, sometimes in true *Proteas* surrounded by colored bractee with dark hairy margins. Their stamens are four, with distinct anthers, which rarely adhere together. The pollen is triangular; the stigma undivided and usually oblique. Their fruit is of various kinds, either a solitary nut or a sort of cone consisting of many nuts immersed among the indurated remains of abortive flowers. Of their properties, little is known. Some of the *Rhópals* afford tolerable timber; the bark of *Protea speciosa* and *grandiflora* is astringent and useful in diarrhoeas. The seeds of *Embóthrium tinctorium* yield a powder which is employed for dyeing pink. The *Proteas* of the Cape, and the *Banksias* and *Dryándras* of New Holland, are the finest plants of the order.

252 <i>Aútax R. Br.</i>	237 <i>Spatálla R. Br.</i>	243 <i>Xylomelum R. Br.</i>	249 <i>Brabejum W.</i>
2053 <i>Leucadéndron R. Br.</i>	238 <i>Persoónia R. Br.</i>	244 <i>Telopéa R. Br.</i>	

ORDER CXXXII. THYMELÆÆ.

Nearly all shrubby plants, found in all parts of the world, but most abundantly in the south of Africa. The flowers are white, yellow, or red, most commonly in clusters, and often fragrant; the foliage is entire, either smooth or silvery, and generally very neat. Their wood is particularly soft; their inner bark easily separable and in *Daphne Lagetta*, pulls out by the division of the vertical fibres into a sort of network resembling lace. Their bark is extremely acrid, acting as a vesicatory when applied to the skin, and if chewed, producing extreme heat and torture in the mouth; a decoction of it has been used with some success in venereal diseases. The seeds of these plants are poisonous to man, but birds eat them with impunity. The fibres of *Dirca* and *Lagëtta* are used for cordage; those of *Daphne gnidium* and *Passerina tinctoria* are employed in the south of Europe for staining wool yellow, which is converted into green by the addition of *Isatis*.

249 <i>Struthiola W.</i>	911 <i>Dirca W.</i>	914 <i>Passerina L.</i>	1032 <i>Dâis W.</i>
909 <i>Lagëtta J.</i>	912 <i>Gnidia W.</i>		

ORDER CXXXIII. SANTALACÆÆ.

Trees or dwarf herbs, with inconspicuous or unattractive flowers. They are chiefly natives of the Cape, New Holland, and India, a few only being found in Europe and North America. Their virtues are few. The wood of *Santalum album* has a sweet aromatic flavor, and a slightly bitter taste: it is chiefly known as a perfume, although it is said to possess mild sudorific properties. The leaves of *Myoschilos* are purgative, of *Ostrya japonica* eatable as salad; *Thesium* is slightly astringent.

307 <i>Santalum W.</i>	908 <i>Memécylon W.</i>	9051 <i>Ostrya W.</i>	2161 <i>Nýssa W.</i>
569 <i>Thesium W.</i>	1033 <i>Bucida W.</i>	2141 <i>Fusânus L.</i>	2162 <i>Hamiltonia W.</i>

ORDER CXXXIV. ELÆAGNÆÆ.

Hardy shrubs or small trees, with deciduous leaves, covered, as well as the bark, with minute silvery scales: their flowers are inconspicuous, but sometimes agreeably fragrant. They occupy but little space; a few inhabiting China and Japan, and the remainder Europe, North America, and Guiana. The berries of *Hippophae rhamnoides*, which are slightly acid, are used as a kind of sauce by the Swedes.

259 <i>Elæagnus W.</i>	2057 <i>Shepherdia Nutt.</i>	2058 <i>Hippophae W.</i>
------------------------	------------------------------	--------------------------

ORDER CXXXV. ARISTOLOCHIÆÆ.

Here we are on the limits of Monocotyledones and Dicotyledones. The species are herbaceous or half shrubby plants, with simple, often reniform, leaves; and mottled grotesque flowers, usually brownish purple. Their roots are all bitter, and possessed of tonic and stimulating properties; but the degree in which they exist in different species is not at present ascertained. The *Aristolochias* have been in former days praised as emmenagogues, and many are still used in South America as a remedy for the bite of serpents. *A'sarum europæum* is a purgative and emetic when fresh, but its powers are much diminished by drying; its dried leaves are occasionally used by the country people in some parts of England as a sternutatory.

1072 <i>A'sarum W.</i>	1934 <i>Aristolochia W.</i>
------------------------	-----------------------------

ORDER CXXXVI. EUPHORBIAÆÆ.

Weeds and lofty trees, of such varied appearance and property, that it is scarcely possible to frame a brief character by which they can be expressed. Their vegetation in cold countries is mostly herbaceous, in hot countries frutescent or arborescent; their juice is milky, and their flowers mostly inconspicuous. It is for their medicinal properties that they are chiefly known, and these are as various as their aspect; mostly, however, dangerous, and always to be suspected. In a few of them, the smell and taste are aromatic; but in most, there is either no smell or it is nauseous, and the taste constantly acrid and pungent. Some possess also an acrid limpid fluid, which is given out by the leaves when touched. Many of them act strongly upon the kidneys, as several species of *Phyllanthus*, the leaves of *Mercurialis annua*, and the root of *Ricinus communis*. Many are said to be powerful medicines in cases of dropsy. The bark of several *Crôtos*, the wood of *Crôtum Tiglium* and *Bûxus*, the leaves of the same, and also of *Cicca disticha*, several *Euphorbias*, and others, are recorded as sudorifics, and useful against syphilis; as emetics, we find the roots of the *Euphorbias*, the juice of *Cómnia*, *A'nda*, *Mercurialis perennis*, &c. A great number are purgative, especially the leaves of *Bûxus* and *Mercurialis*, the juice of *Euphorbia*, *Cómnia*, *Hûra*, the seeds of *Ricinus*, *Crôtum Tiglium*, *A'nda*, and *Játropha*. The effects of some others are so dangerous, particularly *Hippoméne*, that it is not advisable to administer them even in very small doses; even in many *Euphorbias* it is difficult to draw a line between the quantity in which they are poisonous, and that in which they are harmless or useful. The nature of their poison is mostly acrid, occasionally, however, mixed with something narcotic, as is apparent from the effect of those which are used for poisoning or rather stupifying fish. The purgative oil in which the seeds of many are found to abound, has been determined to reside wholly in the albumen; hence the embryo of some, as *Omphalea diandra*, is eaten as nuts. Boiling or roasting has also the effect of dissipating their noxious effects; thus *Játropha Manihot*, than which there scarcely exists a more dangerous poison, affords a food when submitted to fire, called cassava, the flour of which is often used in London as a luxury for making puddings, than which few are reputed to be more wholesome. But the most curious of all the products of *Euphorbiacæ* is the *Cacutheou*, that singular substance which, although the produce of dangerous acrid trees, possesses nothing whatever which has been found capable of acting upon the human system in whatever way applied, which is unalterable either in air, in water, or in spirits, although it softens at a high temperature. It is chiefly produced by *Siphonia elástica*, but also exists in the juice of very many others, as *Excacaria Agallocha*, *Hippoméne Mancinella*, *Hûra crépitans*, *Sâpium acuparium*, *Plukenetia volubilis*, the *Játrophas*, *Mâbea*, *Omphalæas*, and many others. *Tournesole*, another curious chemical preparation, is the juice of *Crôtum tinctorium*, but is also found in several others. Many other properties belong to this order, which it would be too long to detail in this place. The curious reader will find ample information in the medical division of *M. Adrian de Jussieu's* monograph of the order, from which most of the foregoing remarks are taken.

---------------------------	--------------------------	-------------------------------

ORDER CXXXVII. RESEDACEÆ.

Weeds of no interest, except the *Réseda odoráta* for its delicious fragrance. *R. lutícola*, a common annual in waste places, yields a yellow color fit for dyeing.

1102 <i>Réseda W.</i>	2099 <i>Datisca W.</i>
-----------------------	------------------------

ORDER CXXXVIII. CALYCANTHEÆ.

Handsome grateful deciduous shrubs, with deliciously fragrant flowers, natives of North America and Japan. They are not known to possess any medicinal virtues, but their odour insures them a place in every garden, notwithstanding the uninviting look of the blossoms themselves.

1157 <i>Calycánthus L.</i>	1158 <i>Chimonánthus Lindl.</i>
----------------------------	---------------------------------

ORDER CXXXIX. ATHEROSPERMEÆ.

Allied to the last in sensible and botanical qualities: they are shrubs, natives of America and New Holland, of which little is known either to gardeners or botanists.

2103 <i>Peúmus Pers.</i>

ORDER CXL. EMPETREÆ.

Dwarf heath-like shrubs, with obscure flowers and berries, natives of Europe and North America.

2045 <i>Empétrum L.</i>

ORDER CXLI. URTICEÆ.

Few are the objects in this order deserving the care of the cultivator; it is rather extraordinary, however, that those few are abundantly so. Among worthless weeds and shabby half herbaceous shrubs, some of which are covered with rough points, and others defended by stinging hairs, we find the fig, the mulberry, the hemp, the hop, and the bread-fruit, all objects of the first consequence to the world. Here also is placed the half fabulous *Upas*, with which lying travellers and credulous naturalists have long deluded Europe. The *Upas* tree is now known to be the *Antifáris toxicáris*, the inspissated juice of which is indeed a frightful poison, but the baneful effects of whose branches are purely imaginary. Similar, though inferior, qualities have been found to exist in *Ficus toxicáris*, and some of the *Artocárpus*. The root of the black mulberry is bitter, acrid, and purgative; of *Dorsténia brasiliénsis*, emetic; of *D. contrayérba*, bitter, aromatic, hot, and stimulant. A decoction, and the dried leaves, of hemp, is eminently narcotic, and forms the basis of the well known intoxicating Turkish drug called *Bang* or *Haschisch*. The tenuous nature of the fibres of the hemp is also found in other plants of the order, especially *Urtica cannabina*, the hop, the bread-fruit tree, the common stinging-nettle, and others.

ORDER CXLII. AMENTACEÆ.

Here is the group in which all the timber trees of Europe, and most of those of all cold countries, are stationed. Every genus consists of plants important to the wants of man. The alder, the birch, the willow, the poplar, the oak, the chestnut, the hornbeam, and the plane, are all collected in this place, to which they have been brought by the coincidence of similar fructification existing in all of them. This similarity depends upon their producing flowers of one sex only, the males of which are always arrayed in catkins, of which the flowers are destitute of calyx or corolla, in the place of which is produced a single scale. Their bark is furnished with an astringent principle, which has rendered them valuable either for staining black, as in the alder and the oak gall; or for tanning, as in the oak; or as febrifuges, as the alder, the birch, the oak, most of the willows, and also *Pópulus tremuloides*, which is well known in North America as a tonic and stomachic febrifuge. The substance called *tacamahaca* was formerly supposed to be produced by some of the poplars, but it is now believed to be obtained from a very different plant, *Fagara octáandra*. The fruit of many *Amentacæ* contains a considerable proportion of fecula, which renders it fit for the food of man and other animals, as the acorns of the oak, the mast of birch, the nut of *Castánea* and *Córylus*, &c.

2087 <i>Pópulus W.</i>			

ORDER CXLIII. ULMACEÆ.

Many of the observations upon the last order are also applicable to this, which differs rather in certain technical characters, than in any arrangement of nature. The elm is its representative, from which the others only slightly differ.

616 <i>Planéra Mich.</i>	615 <i>U ínus L.</i>	2145 <i>Céltis W.</i>
--------------------------	----------------------	-----------------------

ORDER CXLIV. CASUARINEÆ.

These are nearly related to *Conifera*, than which they are dwarfer, and of far less importance. By various writers they have been tossed about between *Amentacæ* and *Conifera*, and have at last settled in a place by themselves. The leaves of *Comptónia asplenifolia* are employed in the United States against diarrhoea. The berries of *Myrica cerifera* yield, on boiling, an abundance of wax which is manufactured into candles; the nuts of *Ephédra distáchya* are eatable; the wood of some of the *Casuarinas* is remarkably hard and durable.

1936 <i>Casuarina W.</i>	1941 <i>Comptónia W.</i>	2056 <i>Nagóia Gaertn.</i>
2115 <i>Ephédra W.</i>	2055 <i>Myrica W.</i>	

ORDER CXLV. CONFEREÆ.

These bear the same relation in point of consequence to resinous trees, that *Amentacæ* bear to those that are not resinous. They are well known as lofty timber, yielding valuable wood and abundance of resin.

Among them is now numbered the loftiest tree in the world, a species of pine found by Mr. Douglas in California, which grows 220 feet high, with a circumference of 60 feet. Pitch, turpentine, Venice turpentine, are produced by various species. Gum Sandarach, by *Thúja quadrivalvis*; a matter like olibanum, by *Juniperus lycia*; a sort of liquid storax, by *Altingia excelsa*. The *Juniperuses* in which the resin is "incompletely oxygenized," are more fragrant, and also stimulating in a greater degree; as the savin for example. The berries of many of these plants possess similar qualities. Their seeds are all oily; those of *Pinus Pinea*, *Cembra*, and *Lambertiána*, and *Salisbúria adiantifolia*, are eatable as nuts. The fleshy fruit of the ivy, which is poisonous, is an exception to the general innoxious character of the order. *Coniferae* are mostly inhabitants of the northern parts of the world, where they form immense forests, and supply with their dense persistent leaves the place occupied by the evergreen trees of warmer climates. A few are found in the southern hemisphere.

2012 <i>Pinus W.</i>	2017 <i>Cuprèssus W.</i>	2112 <i>Araucária J.</i>	1670 <i>Exocárpus Lab.</i>
2013 <i>Abies Salisb.</i>	2018 <i>Thuja W.</i>	2010 <i>Bélis Salisb.</i>	2016 <i>Podocárpus L'her.</i>
2014 <i>Lárix Salisb.</i>	2113 <i>Juniperus W.</i>	2011 <i>A'gathis Salisb.</i>	2114 <i>Táxus W.</i>
2015 <i>Schubértia Mirb.</i>			

ORDER CXLVI. CHLORANTHÆ.

Obscure Asiatic weeds of no known use, and wholly destitute of interest for gardens.

25 *Chloránthus W.*

ORDER CXLVII. PIPERACEÆ.

The peppers are far more valuable in commerce than interesting in cultivation, their flowers being in all cases very insignificant, and their leaves so uniform in appearance, as to create but little variety. Nearly the whole indeed of the herbaceous species or *Peperómias*, as they are sometimes called, are mere weeds. The berry of the pepper is well known to be hot, aromatic, pungent, and stimulating; not only in the common peppers of the shops, but also in *P. cubéba*, *carpúnga*, and *heterophýllum*. The *Piper aoiásum* yields a strong smell of anise; a decoction of its berries is used in Spanish America for washing ulcers. The *Piper Bétel* and *Siribóba* afford the Malays a powerfully acrid and exciting preparation, which, they suppose, invigorates and enables them to withstand the debilitating influence of their climate. In the South Sea Islands, an inebriating beverage is procured by the mixture of the leaves and stems of *P. loëbrians* with water. No pepper has yet been found beyond the limits of the tropics. *Saurúrus* is the representative of the order in extra-tropical countries.

77 *Piper W.*

872 *Saurúrus W.*

ORDER CXLVIII. CYCADEÆ.

The true station of this very curious order is extremely unknown. Although placed here in conformity with the common practice, it is to be supposed that its true station is in the immediate vicinity of ferns, with which the species agree in veneration, and in many curious particulars. All are natives of countries beyond the reach of frosts, chiefly of the Cape of Good Hope and equinoctial America. With a low trunk which rarely exceeds the height of a few inches, they have the fronds and appearance of pigmy palms, and the inflorescence of gigantic *Equisetums*. The trunk of *Cýcas* contains a great quantity of fecula, which is manufactured into a kind of spurious sago; and a similar substance, it has lately been ascertained, may be obtained from the stem of *Cýcas*. (*Gard. Mag.*, vol. iv.)

2107 *Cýcas W.*

2108 *Zámia W.*

CLASS II. MONOCOTYLEDONES.

The physiological peculiarities of this class of plants have been already explained in the general remarks which precede this arrangement of natural orders. To what is there stated, little remains to be added, except that in these northern regions, every thing included in it is herbaceous, and that in hotter latitudes, few deserve the name of either bush or tree, except the palms, and a few *Aroideæ* and *Asphodeleæ*.

SECTION I. STAMENS EPIGYNOUS.

ORDER CXLIX. HYDROCHARIDÆ.

Floating white-flowered plants, of which *Stratiótes* is the most majestic. They possess no known properties, but have the singular character in *Monocotyledones* of being in some cases lactescent. The species are natives of various parts of the world.

308 *Trápa W.*

859 *Damasónium W.*

2089 *Hydrocháris W.*

2096 *Stratiótes W.*

ORDER CL. ORCHIDÆ.

Of all tribes of plants, this is the most singular, the most fragrant, and the most difficult of culture. The flowers are often remarkable for their grotesque configuration, which has been likened to heads and bodies of animals, and for the strange character of their stems, which are sometimes attenuated into a degree of gracefulness scarcely equalled even among grasses, and sometimes contracted into a clumsy goutiness of figure such as is known no where else. The species are found inhabiting the mountains and meadows of the cooler parts of the globe, or adhering by their tortuous roots to the branches of the loftiest trees of the tropical forest, to which their blossoms often lend a beauty not their own. Vulgarly, this last description of plants is called parasitic; they are, however, not so, deriving no support from the juices of the plants on which they grow; but on the contrary, are epiphytes, merely adhering to other plants for support, and vegetating amidst the rich black soil which collects at the foot of all trees growing in a hot humid climate. It is very singular that the pollen of these plants has no parallel, except among the very different and distinct order of *Asclepiadææ*. The only medical properties of the order exist in the roots of some of the *Orchides*, from which the nutritious substance called salop is prepared. The *Vanilla* of the shops is the pod of the genus called *Vanilla*. From the boiled stems of some of the Brazilian species a tenacious glue is obtained, which is employed in many useful purposes.

Tribe 8. CYPRIPEDEÆ.

1931 *Cypripédiium W.*

ORDER CLI. SCITAMINEÆ.

These are distinguished from the last by their pollen not cohering in masses, their seeds not being winged, and their plurilocular ovarium. Their sensible qualities are also widely different. The species are natives only of the tropical parts of the world, where they form stemless or caulescent herbaceous plants, with long broad leaves, and flowers of white, yellow, or red, often possessing great fragrance, and generally much beauty. Their sensible qualities reside either in the root or the seeds. The former is the part used of the Ginger, the Galangale, the Costus, Turmeric, Zedoary, and others, all of which are more or less aromatic. The root of turmeric is also well known as affording a yellow dye, a property which it possesses in common with some others. The seeds of Cardamom are well known for their aromatic stimulating powers.

6 <i>Hedýchium W.</i>	9 <i>Hellénia R. Br.</i>	12 <i>Kämpféria W.</i>	15 <i>Glóbbá Rosc.</i>
7 <i>Roscóea Sm.</i>	10 <i>Zingiber Rosc.</i>	13 <i>Amómum Rosc.</i>	16 <i>Mantisia Sims</i>
8 <i>Alpinia W.</i>	11 <i>Cóstus Rosc.</i>	14 <i>Cureóma W.</i>	

ORDER CLII. CANNEÆ.

Differing from the preceding, in the absence of aromatic principles, in the petaloid nature of the filament, and the single cell of their anther, they wholly resemble them in external appearance and geographical distribution. The Cannas are well known for their beautiful flowers, and the Maránta arundinácea is celebrated for the abundance of nutritive facula which is prepared from it, and imported to Europe under the name of arrow-root.

1 <i>Cánna W.</i>	4 <i>Thália W.</i>	3 <i>Calathéa Meyer.</i>
2 <i>Maránta W.</i>	5 <i>Phrynium W.</i>	

ORDER CLIII. MUSACEÆ.

A noble order of plants, resembling the two last in appearance, but of far more gigantic stature, different geographical distribution, and sensible qualities. All the species, without exception, are among the grandest in the vegetable world, whether the breadth and beauty of their foliage, or the surpassing grandeur of their flowers, be considered. They are not, like Scitamineæ and Canneæ, confined to the tropics, but approach in many points towards the cooler latitudes of either hemisphere. While the *Strelitzias*, resplendent with orange and scarlet and white, are peculiar to the Cape of Good Hope, the plantain is laden with its enormous masses of wholesome pleasant fruit, in the mild climate of Madeira; the *Heliconias* and *Uránias* appear in the sultriest forests of Madagascar and Guiana. The fruit of the *Músa* is, as just stated, pleasant and wholesome; and the leaves of the same plant form a valuable thatching for cottages; and the fibres of a particular species are manufactured into a fine hemp, from which the most delicate muslins of India are prepared.

570 <i>Helicónia W.</i>	571 <i>Strelitzia H. K.</i>	721 <i>Músa W.</i>	722 <i>Uránia W.</i>
-------------------------	-----------------------------	--------------------	----------------------

ORDER CLIV. HÆMODORACEÆ.

The name of this order, derived from *αἷμα*, blood, indicates its most striking peculiarity; the roots of several species of *Hæmodórum*, *Wachendortia*, and *Heritiera* yielding a brilliant crimson dye. The species have equitant leaves, and six stamens, with anthers turned towards the ovarium; in which last character they differ from the closely allied order of Irideæ. They are found, with very few exceptions, in the Cape of Good Hope and New Holland.

108 <i>Xiphidíum W.</i>	111 <i>Hæmodórum Sm.</i>	718 <i>Lophola B. M.</i>	720 <i>Anigózanthos Lab.</i>
110 <i>Wachendórfia Ker</i>	113 <i>Dilatris Ker</i>	719 <i>Argofásia Juss.</i>	

ORDER CLV. IRIDEÆ.

The peculiarity of this order exists in the superior six-cleft perianthium, three stamens opposite the outer segments, and the anthers so inserted that the line of their bursting is towards the outside of their flower. Occasionally, they are still called by the old appellation of *Ensate*. Most of the species are extremely beautiful; and as they are generally very easily cultivated, they have become universal favorites in gardens. Many of the species are found by the side of streams, or in rich pastures in Europe, Siberia, and America; others adorn the most barren deserts of the same countries, with their perishable flowers; a third set, consisting for the most part of *Sisyrinchium* and its allies, are found in cool parts of the islands in the South Seas; and, lastly, a large proportion of the order contributes to the herbage of Southern Africa, that indescribable charm which has captivated all observers. Their medicinal virtues are trifling. *Iris florentina* and *germánica* have roots, which, when dry, smell like violets, and are slightly stimulant, acting as sternutatories or purgatives, according as they are employed. The stigmas of the *Crocus* form the well-known saffron, which differs from the general character of the order, in being aromatic, and possessing a valuable coloring matter, which has the singular property of entirely disappearing under the influence of the sun's rays.

93 <i>Crocus Ker</i>	95 <i>Ixia Ker</i>	97 <i>Geissorhiza Ker</i>	99 <i>Sparáxis Ker</i>
94 <i>Witénia Ker</i>	96 <i>Trichonéma Ker</i>	98 <i>Hesperántha Ker</i>	100 <i>Tritónia Ker</i>

ORDER CLVI. AMARYLLIDÆÆ.

Here we have another group of vegetation so lovely as to have excited admiration from the days of Solomon, who called them the lilies of the field, down to our own period. Their roots are all bulbous. In stature they seldom exceed a foot or two: in *Doryánthes*, and some species of *Crinum* alone, much surpassing such a size; in foliage they possess a uniformity of figure which is very singular; in color they vary from white and yellow to deep scarlet and azure blue; in fragrance they vie with the violet and the primrose. Some of the species are natives of thickets in the cooler provinces of Europe and Asia; others are found deep rooted in the burning shores of islands where scarcely a blade of grass interposes itself between them and the torrid rays of a scorching sun; many spring up in the gloomy, damp, and sultry woods of equinoctial America; and another set intermingles with the *Ixias* and *Gladíoluses* of Southern Africa. Several of the *Narcissi*, independent of their beauty, possess emetic qualities; from the viscid juice of *Hæmánthus toxicárius*, the Hottentots procure a poison wherewith to smear their arrows.

711 <i>Narcíssus W.</i>	731 <i>Hæmánthus W.</i>	737 <i>Brunsvígia Heist.</i>	743 <i>Zephyránthes' Herb</i>
712 <i>Pancrátium W.</i>	732 <i>Galánthus W.</i>	738 <i>Nerine Herb.</i>	744 <i>Habránthus Herb.</i>
713 <i>Eucrósia B. Reg.</i>	733 <i>Leucójum W.</i>	739 <i>Amáryllis W.</i>	745 <i>Doryánthes R. Br</i>
714 <i>Eúrycles Salisb.</i>	734 <i>Strumária Jacq.</i>	740 <i>Vallóta Herb.</i>	746 <i>Gethýllis H. K.</i>

716 <i>Chlidánthus Herb.</i>	736 <i>Cyrtánthus H. K.</i>	742 <i>Sternbérgia W.</i>	749 <i>Conánthéra Fl. per.</i>
717 <i>Chrysiópalia Ker</i>			

ORDER CLVII. HYPOXIDÆÆ.

America, New Holland, the Cape of Good Hope, Polynesia, and the Indian Archipelago give birth to these plants, which have sweet yellow flowers and linear leaves, protected by long weak hairs. Nothing is known of their medicinal qualities.

750 <i>Hypóxis W.</i>	751 <i>Curcúligo H. K.</i>
-----------------------	----------------------------

ORDER CLVIII. DIOSCOREÆ.

A climbing stem, and broad, cordate, or angular leaves, inconspicuous yellowish flowers, and a large fleshy root, are the obvious characteristics of this order, of which the yam is the representative; the roots of this plant yield one of the most important articles of food in the tropical countries.

2083 <i>Testudinária Eurch.</i>	2084 <i>Rajánia W.</i>	2085 <i>Dioscórea W.</i>
---------------------------------	------------------------	--------------------------

SECTION II. STAMENS PERIGYNOUS.

ORDER CLIX. HEMEROCALLIDÆÆ.

These are fine showy plants, bearing their flowers in umbels or raceme, either white, yellow, red, or blue; they are mostly inhabitants of temperate zones, and are of little utility, with the exception of the Aloe, the purgative powers of which need not be insisted on. This genus is, besides, remarkable among *Monocotyledones* for its fleshy leaves, in which, and its woody stem, it offers a striking deviation from the usual structure of these plants.

747 <i>Poliánthes L.</i>	769 <i>Hemerocállis W.</i>	777 <i>Tritoma B. M.</i>	780 <i>Tulbághia W.</i>
767 <i>Agapánthus W.</i>	770 <i>Aloe W.</i>	778 <i>Veltheimia H. K.</i>	792 <i>Brodiaea Sm.</i>
768 <i>Blanfórdia R. Br.</i>	776 <i>Alétris W.</i>	779 <i>Sanseviéra W.</i>	

ORDER CLX. ASPHODELEÆ.

Different from *Hemerocallidæ* in their expanded flowers and dark crustaceous seed-coat; the only characters which have yet been discovered to distinguish them. The species are all pretty, many very handsome, some bulbous, some with fasciculated roots, a few with arborescent stems. They are uncommon in tropical countries, very abundant in temperate latitudes, and not infrequent in the cooler regions of the world. Among the prettiest are *Gágea*, *Scilla*, and *Hyacínthus*; the least interesting are *Chlorophytum* and *Zuccágnia*. *Aspáragus* and *Dracæna* have berried fruits; the former is diuretic, and when young is employed as a favorite food; the same properties are possessed by *Scilla* and *Allium*. The stamens of *Arthropódium* are remarkable for their tuft of yellow hairs, of *Dianélla* for the thickening of the filaments. Many of the *Alliums* are very pretty, and admired notwithstanding their unpleasant odor; their roots are all eatable, and those of some among the most useful articles of food. *Thysanótus*, the fringed violet of New Holland, has rich purple blossoms, with long delicate fringes which sparkle in the sun, as if continually bedewed with minute particles of water. From *Phórmium ténax* the strong fibrous substance called New Zealand flax is prepared. *Xanthorrhæa* has an arborescent stem which abounds in resin.

808 <i>Asphódelus W.</i>	815 <i>Eustréphus R. Br.</i>	795 <i>Sowerbæa L. T.</i>	818 <i>Uropátalon Ker</i>

813 <i>Narthécium B. M.</i>	796 <i>Allium W.</i>	816 <i>Aspáragus L.</i>	793 <i>Peliosánthes B. R.</i>
814 <i>Dianélla Lam.</i>	797 <i>Albúca W.</i>	817 <i>Drimia Jacq.</i>	2111 <i>Róscus W.</i>

ORDER CLXI. SMILACÆÆ.

These scarcely differ from the bacate *Asphodelæ*, except in their usually trifid style, and the membranous integuments of the seed. Many are interesting plants, especially the lily of the valley, a species of *Convallária*, the odor of which is perhaps the most grateful in the vegetable kingdom. Several others, as *Uvulária*, *Smilacina*, *Polygonátum*, and *Tríllium* are objects of ornament. *Smilax* is remarkable for its twining stems, and its leaves, which resemble those of *Dicotyledones*; the roots of several species form the sarsaparilla of the shops, a drug, the nature of which is mucilaginous and rather bitter, and which is employed as diaphoretic and diuretic. *Medéola* is also an active diuretic. The roots of *Támus* are purgative and dangerous.

785 <i>Uvulária W.</i>	788 <i>Smilacina Desf.</i>	843 <i>Myrsiphýllum</i>	2082 <i>Támus W.</i>
786 <i>Streptópus M.</i>	789 <i>Polygonátum Desf.</i>	846 <i>Medéola W. en.</i>	850 <i>Tríllium W.</i>
787 <i>Convallária Desf.</i>	790 <i>Ophiopógon Ker</i>	2081 <i>Smilax W.</i>	729 <i>Páris W.</i>

ORDER CLXII. BROMELIACÆÆ.

Of these the eatable pine-apple is the representative, from which the other genera differ more in the want of a fleshy fruit than in general appearance. Their habit is acid, their leaves rigid and toothed with spines, and covered with minute scales, their bractæe often colored with scarlet, and their flowers either white or blue.

They are all natives of tropical countries, with the exception of Tillandsia, which, in the humid woods of Carolina, forms dense festoons among the branches of the trees; this, like many others of the order, is an epiphyte, vegetating among the black mould that collects upon the bark of trees in hot damp countries; others are inhabitants of deep and gloomy forests; and others form, with their spiny leaves, an impenetrable herbage in the extensive pampas of Buenos Ayres and Brazil. From the Agave mexicana a fermented beverage is prepared, from which a strong colorless spirit, resembling the best Scotch whiskey, is distilled.

726 Broméla <i>W.</i>	727 Guzmánia <i>Fl. per.</i>	723 Bonapártea <i>F. P.</i>	725 Furcra'a <i>F.</i>
728 Pitcairnia <i>W.</i>	729 Tillandsia <i>W.</i>	724 Agave <i>H. K.</i>	

ORDER CLXIII. LILIACEÆ.

It is doubted whether several of the preceding orders are not rather sections of this; until, however, the combination of these shall be effected by some hand yet more masterly than those by which they have been divided, it is best to let them remain as they are. The beauty of the plants composing the Liliaceæ, strictly so called, is universally acknowledged; the rich colors of the branching lilies, the vivid hues of the painted tulip, the modest graces of the humble Erythrónium, and the portly forms of the Yúcea are all attractions of which no good garden should be destitute. The species are all inhabitants of either cold or temperate latitudes.

771 Liliium <i>W.</i>	773 Fritillária <i>W.</i>	782 Erythrónium <i>W.</i>
772 Túlipa <i>W.</i>	781 Yúcea <i>W.</i>	

ORDER CLXIV. MELANTHACEÆ.

These, too, are pretty herbs, although destitute of the grandeur of the preceding, which, however, they far surpass in the potency of their virtues. The flowers of many are inconspicuous, and of a dull-green or yellow color, sometimes assuming a livid hue, which will bespeak the nature of their powers. A dangerous or poisonous acrid juice is their characteristic, which is particularly active in some of them, such as the Colchicum and Verátrum. The roots of the former are the basis of the eau médicinale, and are now used in cases of gout with much success. The root of Verátrum is believed to have been the hellebore of the ancients, an active drug, which, administered in small doses, is a drastic purgative, in more abundance a violent emetic. The root of Helónias dioica, infused in water, is anthelmintic, but, steeped in spirits, yields a bitter and tonic tincture. The leaves of Colchicum and Verátrum often produce vomiting and severe pain in the animals that eat them; the flowers of the first are also said to be poisonous, and its seeds to possess the same properties as the roots, but in a milder degree. Groves and pastures in Europe and Siberia and North America are the most frequented by Melanthaceæ, several are found at the Cape, and Gloriósa is a native of the woods or middle Africa.

851 Colchicum <i>W.</i>	847 Xerophýllum <i>Mich.</i>	849 Androcymbium <i>W.</i>	858 Nolina <i>Mich.</i>
784 Bulbocóidium <i>W.</i>	842 Lichtensteinia <i>W.</i>	844 Totiéliáa <i>Hud.</i>	2128 Verátrum <i>W.</i>
845 Melánthium <i>L.</i>	848 Wörmbca <i>L.</i>	852 Helónias <i>L.</i>	783 Gloriósa <i>W.</i>

ORDER CLXV. BUTOMEÆ.

Fine water plants, of which Bítomus, by general consent the most beautiful of British plants, has purple flowers; and Linnócháris, a native of the marshes of Brazil, has yellow ones.

939 Bítomus <i>W.</i>	1175 Linnócháris <i>Rich.</i>
-----------------------	-------------------------------

ORDER CLXVI. ALISMACEÆ.

Handsome water plants, with white flowers, and many ovaria. Some are common in our English ditches others are found in similar situations in the tropics.

860 Actinocárpus <i>R. Br.</i>	1988 Sagittária <i>W.</i>	861 Alisma <i>W.</i>
--------------------------------	---------------------------	----------------------

ORDER CLXVII. COMMELINEÆ.

Mostly inhabitants of marshy ground, in either hemisphere, but not known in Europe except in cultivation. America is their grand station. Many are insignificant creeping plants, especially the Commelinas; others, as the Pontedérias are very handsome; and the Dichorizándras are exceedingly noble caulescent plants, with large thyrses of blue flowers: this color is the prevailing one of the order.

84 Callisia <i>W.</i>	89 Anciléna <i>B. P.</i>	730 Pontedéria <i>W.</i>	766 Dichorizándra <i>Vand.</i>
88 Commelina <i>B. P.</i>	90 Cartonéna <i>R. Br.</i>	765 Tradescántia <i>W.</i>	

ORDER CLXVIII. JUNCEÆ.

Inconspicuous, rigid, worthless weeds, for the most part; Xýris and Philydrum, which have pretty yellow flowers, if belonging to the order, being exceptions. They clothe barren ground in most parts of the world, and are the first approach to the formation of a regular perianthium, as we ascend in the scale of vegetation. Xerótes has the habit of a low palm.

86 Xýris <i>L.</i>	761 Lúzula <i>Dec.</i>	2076 Xerótes <i>R. Br.</i>
760 Júnceus <i>L.</i>	839 Flagellária <i>W.</i>	17? Philydrum <i>R. Br.</i>

ORDER CLXIX. ERIOCAULEÆ.

Pretty interesting little bog plants, found in all parts of the world. The order consists of Eriocaulon only, many of whose species are easily cultivated, though seldom seen in gardens. The Eriocaulon septangulare, found in a lake in the Isle of Skye, is, perhaps, the rarest of European plants. They are not known to possess any medical virtues.

223 Eriocaulon <i>W.</i>

ORDER CLXX. PANDANEÆ.

With the habit of palms, and the inflorescence of Aroideæ, this fine order stands very distinctly separated from all others. The stem is an arborescent caudex, either growing to a considerable height, or weak, and lying on the ground. The leaves of some are formed into a coarse cordage; the flowers of *P. odoratissimus*, and the fruit of some others, are eaten. All are tropical.

2004 Carludóvia <i>Fl. per.</i>	2041 Pandánus <i>W.</i>
---------------------------------	-------------------------

ORDER CLXXI. NAIADES.

Floating uninteresting plants, scarcely susceptible of cultivation: they form a close approach to Cellulares.

1938 Zannichéllia <i>W.</i>

ORDER CLXXII. RESTIACEÆ.

Rigid, inelegant, often leafless plants, with split vaginæ, and the habit of some Cyperaceæ, or true Junceæ. They are all inhabitants of the southern hemisphere, especially of the Cape of Good Hope and New Holland.

2046 Willdenóvia <i>Th.</i>	2047 Réstio <i>W.</i>	2048 Elégia <i>W.</i>	2110 Leptocárpus <i>R. Br.</i>
-----------------------------	-----------------------	-----------------------	--------------------------------

ORDER CLXXIII. PALMÆ.

These were well named by Linnæus, the princes of the vegetable world; for they far surpass all other plants in the grandeur and majesty of their port. Their lofty stem, supported by a mass of fibrous roots, which frequently creep along the surface of the ground, consists of wood with longitudinal fibres, soft in the centre, but hard as horn itself at the circumference; it is almost always unbranched, bearing a tuft of leaves at the summit; in a very few cases it is dichotomous, always round, and it terminates by a single bud; by the fall of the petioles of the leaves, which sheath it in a greater or less degree at the base, it is covered with large scars. The leaves, technically called fronds, are pinnate or flabelliform, never simple; and, in a young state, before they expand, they are folded up in plaits from the base to the apex. The flowers are small, with bractæe at their base, either sessile or seated in some cavity, of a pallid color, and contained in a large bag called a spathe; when they open, the mass of inflorescence, called a spadix, bursts suddenly through the under side of the spathe, generally evolving the most fragrant odors. Impregnation takes place rapidly, through the injection of the pollen upon the humid surface of the stigmas, which gape open to receive it. The fruit is perfected in a period varying from six months to a year; when ripe it is a drupe or berry, with either a tenuous or fleshy coat; the mass of its kernel consists of oily albumen, which, in the case of the cocoa nut, is soft enough to be eaten, but which in most species is as hard as horn. Dr. von Martius, the celebrated traveller in Brazil, to whom the world is indebted for nearly all that is known of these plants, concludes his remarks upon the characters of the order in the following words:—"Palms, the noble offspring of Terra and Phœbus, are natives of those happy countries within the tropics, where the rays of the latter are ever beaming. In all such climates they are to be found, with this limitation, however, that in the southern hemisphere they do not overstep the 35th degree of latitude, nor in the northern the 40th. Most species are confined within fixed and narrow bounds, for it comes to pass that wherever a district is characterized by striking peculiarities of soil or climate, those species exist which are not found elsewhere; but few, on the contrary, extend over a large extent of surface, as the *Cocos nucifera*, *Acroëmia sclerocarpa*, *Borassus flabelliformis*, &c. It is probable that the number of palms existing on the face of the earth, will be found by future travellers to amount to as many as a thousand species. Most of them love the margins of springs and streams, but few establish themselves on the shores of the ocean, and yet a smaller number ascend into the alpine regions of their country; some collect in large forests; some are scattered singly or in clusters, among woods and plains. In the most ancient periods of the world, when the genera of plants were beginning to be formed, palms scarcely existed; they were preceded in the creation by the more ancient Ferns, Cycadææ, Grasses, and Equisetacææ. Some of their remains have, however, been found in variegated sandstone, and in limestone of the third order (Stetzkalk), part of which belong to unknown species, and part to species still in existence. But in the times succeeding the deluge, they appear, from the written evidence of historians and poets, to have followed the footsteps of man, to whom their fruit yielded food, drink, and oil; their stems houses, arms, utensils, flour, and wine; and their leaves cordage and roofs for habitations. In cultivation their soil should be slightly saline; they are propagated by seeds more readily than by truncheons of the stem; when cultivated they undergo no alteration, except in producing more fleshy or stemless fruit: it is extremely difficult to transplant them beyond their own country; naturally their migration is absolutely opposed by the barriers of the ocean."

SECTION III. STAMENS HYPOGYNOUS.

ORDER CLXXIV. GRAMINEÆ.

The order of grasses is beyond doubt the most natural of all that the ingenuity of systematic botanists has contrived; it is also the most numerous in species. The inflorescence is very much alike throughout the order, and the floral envelopes, which are bractæe in a progressive state to the form of calyx and petals, offer few striking characters by which the genera can be characterized. Hence it is that the classification of the order, and its division into genera, has not only been found extremely difficult, but has given rise to much difference of opinion among botanists; some of whom, adhering to the synthetical arrangement of Linnæus, admit but a small number of genera, while others, admitting the analytical principles of modern science, divide it into a vast number. The middle course in this, as in most other cases, is probably the just one. A subdivision of the order into tribes, has been attempted by Palisot, Trinius, Dumortier, Raspail, Kunth, Link, and others; that of M. Kunth is here adopted. The general habit of grasses is so familiar to every one, that it may be passed over in silence. They are remarkable for exhibiting, in no case, properties that are actually poisonous; possessing on the contrary, in almost all cases, wholesome and nutritive qualities. These latter are especially obvious in their seeds, which always contain a farinaceous substance, mixed with a certain proportion of glutinous matter. No one is ignorant of the various and important uses of the seeds of wheat, rye, barley, oats, maize, rice, and others, and in general of all the larger kinds of grass. It must however be remarked, that if the smaller sorts are not employed in like manner, it is merely on account of their minuteness, and not on account of any difference in their nature; in fact, in times of scarcity, and in half cultivated countries, use has advantageously been made of *Festuca fluitans*, *Zizânia aquatica*, *Avëna fátua*, *Panicum sanguinale*, *Avëna elatior*, *Bromus secalinus*, and *Elymus arenarius*. It is also to be noted, that the particular uses for which the seeds of certain grasses are employed, are not peculiar to them, but may be obtained from all the others, with slight modifications. Thus beer is made, not only from barley but also from wheat; spirituous liquors not only from our European cerealia, but also from rice. But it must be remarked, that a singular exception to the generally wholesome properties of grasses, appears to exist in *Lolium temulentum*, the seed of which is reported to be narcotic and enebriating, and even poisonous; there is no doubt, however, that these qualities have been greatly exaggerated; for in the first place they disappear in bread or beer manufactured from *Lolium temulentum*; and secondly, in times of scarcity, people have frequently lived upon it. But even supposing all that has been stated upon the subject to be true, this plant will still be found to be little different from wheat, when long exposed to wet; so well, indeed, is this known by country people, that a belief exists, that in wet summers wheat is actually transmuted into rye grass. The exciting properties of the oat, which are very unusual in this order, have been found to reside in the husk and not in the seed, and to depend upon the presence of a minute quantity of an aromatic principle, analogous to Vanilla, lying imbedded in the envelope of the seed, and capable of being extracted by aid of alcohol. As to the deleterious effects of the ergot of rye, these do not depend certainly upon any such property in the rye itself, but is caused either by the ergot disease, or, as is believed, by the parasitic fungus, from the attack of which it arises. Now let us pass from the seeds of Gramineæ to their stems, and we shall find a no less remarkable uniformity of nature in them. They all contain, especially before flowering, a sweet sugary mucilage, which varies in quantity in different species. The sugar cane, in which this is found in greatest abundance, not only constantly exists in the most favorable condition for producing it, as it rarely flowers, but is also one of the largest grasses known. The maize also abounds in sugar; and the same substance is secreted in such abundance by the *Sorghum saccharatum*, that attempts have actually been made in Italy to cultivate it as the sugar cane. The creeping roots of grasses, which are generally mucilaginous and demulcent, are sometimes used in medicinæ; but they are of more importance for retaining in banks the sand of the sea shore, so as to form artificial cliffs on flat coasts, to restrain the inroads of the sea. The stems of *Andropogon schænanthus*, the leaves of *Andropogon citratus*, the roots of *Andropogon nardus*, and the whole plant of all the species of *Anthoxanthum*, exhale an aromatic odor, and possess slightly tonic properties. To conclude, the epidermis of grasses has been found to contain a considerable quantity of silex.

ORDER CLXXV. CYPERACEÆ.

The sedges, as these may be called in English, differ from grasses not only in their comparative worthlessness, and the different development of the parts of fructification, but also in the sheath, at the base of the leaves, being closed up, not slit. As objects of ornament they are of no value, and as subjects of agricultural interest of but little; they are, moreover, of little utility to man. They are chiefly valuable for covering, with the appearance of herbage, waste, and barren, marshy, or sandy tracts, in which little else will thrive. The roots of Carex arenaria, disticha, and hirta, possess diaphoretic and demulcent properties, whence they are sometimes called German sarsaparilla. Some of the Scirpus and Cyperus have eatable nutty roots; the stems of Scirpus lacustris, Eleocharis palustris, Cyperus textilis, and others, are manufactured into mats and the bottoms of chairs; the roots of Cyperus esculentus abound in oil, a very unusual circumstance; the papyrus of the ancients was manufactured from the stem of Cyperus papyrus; finally, the roots of Cyperus longus, odoratus, and others, are fragrant.

ORDER CLXXVI. AROIDEÆ.

Herbaceous, stemless, or caulescent plants, with broad fleshy leaves, approaching very nearly to those of Dicotyledons. Their flowers are enclosed within a spathe, and are imbedded on a simple cylindrical spadix. Some are natives of Europe and of similar latitudes, but the greater number inhabit the tropics, where they often climb by their rooting stems to the tops of lofty trees. They have thick fleshy roots, which, when fresh, contain an acrid stimulating principle, which is so volatile that it passes off freely upon the application of heat; whence the roasted roots of many species are among the most common articles of negro food. The leaves of Arum seguinum are so paralyzing, that if chewed they deprive one of the power of utterance; whence in the West Indies it is called the *dumb cane*; the leaves of Dracontium pertusum are acrid; fresh gathered, and applied all over the surface of the body, they produce a slight inflammation and blistering, and are used in Demerara, by the natives, in dropsical cases. The root of Arum triphyllum, boiled in milk, has been found efficacious in consumption. The flowers of many species are highly fetid. Typhineæ, or bull-rushes are very like Cyperaceæ in habit. Pistiaçæ are floating plants, in which the organs of fructification are reduced to the very simplest state. Juncaginæ are obscure marsh or river plants.

ORDER CLXXVII. FLUVIALES.

With these the Vasculares and Monocotyledones terminate: it has long been apparent that we have been descending in the scale of vegetation; and hence, the last order exhibited a structure the most simple of all vascular plants. In the present order, *Zostéra* and *Rúppia* are so closely allied to Algæ, that they may be mistaken for them.

24 <i>Zostéra L.</i>	318 <i>Rúppia W.</i>
----------------------	----------------------

II. CELLULARES.

The characteristics of this division have already been explained in the preliminary observations upon the natural orders; and the remarks which were required for each natural order of Cellulares have already been given in Cryptogamia in the body of the work. It has, therefore, been thought advisable to adopt from Professor Agardh such observations as he has made upon the orders, as a sort of contrast to those already given.

CLASS I. FOLIACEÆ.

ORDER I. FILICES.

Of these the stem is perennial, often subterraneous and creeping, and occasionally becoming arborescent and leafy above the ground. The fronds or leaves are usually pinnatifid, and more or less compound; sometimes nearly simple and entire, with reticulated veins. The capsules are minute, one-celled, seldom many-celled, brown, membranous, and surrounded by a thick articulated elastic ring, irregularly bursting, and either clustered on the lower surface of the frond, or compound in spikes. Their veneration is circinate, and some are propagated by bulbs. The old botanists denied any fruit whatever to Ferns; believing the seeds of these plants to be so rare as to invest any body with invisibility who could collect them. Afterwards, their capsules were believed to be their seeds. Linnæus, and some others, doubted whether their fructification were seeds or pollen. Finally, the experiments of Ehrhart and Lindsay proved, beyond all cavil, that they were really seeds. As to the male organs nothing is known; some suppose them to be glands of the frond, others the elastic ring, some the indusium, and others the pores of the epidermis; lastly, Martius has supposed them to be the membrane including the spiral vessels. Ferns are chiefly inhabitants of the torrid zone, becoming rarer as we approach the poles. They delight in a humid soil, and they often grow parasitically upon trees. The medicinal virtues of some are highly astringent, of others anthelmintic, of others purgative; some have acquired celebrity for their pectoral, others for their corroborant qualities. The young leaves and roots of some constitute an article of food; beer is obtained from the roots of others, and, finally, *Aspidium frágrans* has been used as tea.

Tribe 1. POLYPODIACEÆ.

Tribe 2. OSMUNDACEÆ.

2204 <i>Tódea W.</i>	2205 <i>Osmúnda L.</i>	2206 <i>Lygódium Swz.</i>	2207 <i>Anémia Swz.</i>
----------------------	------------------------	---------------------------	-------------------------

Tribe 3. OPHIOGLOSSÆÆ.

2208 <i>Botry'chium Swz.</i>	2209 <i>Ophioglóssum L.</i>	2210 <i>Maráttia Swz.</i>
------------------------------	-----------------------------	---------------------------

ORDER II. EQUISETACEÆ.

Marsh plants, with a verticillate arrangement of their branches, and a highly indurated epidermis. Their seeds are remarkable for a hygrometrical movement. The quality of some is said to be hurtful to cattle which is denied by others. Formerly they were used in medicine as astringents and diuretics. *Equisétum hyemále* has been employed for tea, and as a polishing material for furniture, under the name of Dutch rushes.

2211 *Equisétum L.*

ORDER III. LYCOPODINEÆ.

With the habits of mosses they have the seeds of ferns. They are herbaceous prostrate plants, with imbricated simple leaves. *Lycopódium complanátum*, *Selágo*, and *clavátum* as used as dyes; the spores of *Lycopódium clavátum* are said to be employed for ameliorating wine, and are also used in making fire-works, on account of their inflammable nature. The herb of *Lycopódium clavátum* and *Selágo* is emetic, and produces abortion. *Lycopódium phlegmáta* is reputed an aphrodisiac.

2212 <i>Lycopódium L.</i>	2213 <i>Psilótum Swz.</i>
---------------------------	---------------------------

ORDER IV. MARSILEACEÆ

Floating or erect simple-leaved plants of no known use. The Marsileas, which are to some countries what *Lémna* is to this, are not known in cultivation.

2214 <i>Isoctes L.</i>	2215 <i>Pilulária L.</i>
------------------------	--------------------------

CLASS II. APHYLLÆ

ORDER V. MUSCI.

Winter plants, reviving in humid air, abundant about the poles, rare at the equator. They cover the mountains of the earth as high as the limits of perpetual snow; growing in patches, they clothe the most barren spots with verdure, preserve trees from heat and cold, prepare the earth for nourishing more perfect plants, and fill up bogs and morasses with vegetable matter. To the economy of nature they are, therefore, more subservient than to the purposes of man. Medicinal astringent properties were formerly ascribed to some few, but they are now neglected or forgotten.

ORDER VII. ALGÆ.

Plants ascending from the simplest form known in vegetation to a very compound state. The lowest are filiform, leafless, with their fructification immersed; the highest are leafy, with the fructification included in an indehiscent wart-like pericarpium. Some copulate like animals, others have a spontaneous motion like worms. Their color is pericarpium. Some copulate like animals, others have a spontaneous motion like worms. Their color is green, in the lowest grades green, in the highest red or purple. Some are ephemeral and microscopical, annual or perennial, and others extend to the length of many fathoms. They grow at the bottom of the sea, or in fresh water, the depths of which they clothe with vegetation, as the higher orders of plants cover the earth with forests. They grow on stems in the water only, or on each other. Some exhale oxygen, others are scented like violets. Their taste is mild; their substance gelatinous, membranous, or coriaceous, usually covered externally with mucus. The structure of the lowest is articulated; of the highest fibrous.

ORDER VIII. LICHENS.

Lichens are not only most useful in the Economy of Nature, as preparing the surface of the earth for the reception of larger vegetables, but they are, moreover, of great utility to man. Many, as Cetrária islandica, are edible, having a bitter principle, and giving out a styptic tincture, if immersed in alcohol. Others, steeped in urine or salts, are used for dyeing; crustaceous species of this kind are Variolária oreina, Lecanora tartarea, Lecpária chlorina, &c.; foliaceous species, Parmelia saxatilis, Stieta pulmonácea, Solitaria er-cæa, Gyrophora deusta and pustulata, &c.; and branched kinds, Roccella tinctoria (the common Orchel), U'snea plicata, Alectoria jubata, and others. In medicine, Cetrária islandica and nivális, Stieta pulmonácea, Alectoria usneoides are tonic and nutritive; Parmelia parietina, Borreria purpurácea, Evernia prunástri, &c., are astringent and febrifugal; Peltidæa apthósa, anthelmintic; Evernia vulpina, poisonous. Some yield a gum, as Evernia prunástri; Stieta pulmonácea may be employed for bittering beer instead of hops, and Ramalina

scopulorum instead of scap. The various species give the grey hue to old walls and stones, cover desert heaths, and mottle the bark of ancient trees.

ORDER IX. FUNGI.

We have now reached the lowest station of vegetable existence, in arriving where the vesicles which compose the vegetable fabric are combined in various forms, according to the contingent circumstances under which they are developed. The mould on the cheese, the ergot of corn, the rust of the rose, and the huge Bolétus, which, in Java, spreads out its many-handed body from the trunks of ancient trees like a vegetating demon, differ only in the number of the vesicles of which they are composed. Many species are eatable, as Agáricus campéstris; others are deadly, as Bolétus scáber; some are used medicinally, as Dædálea suavólens in coughs; Agáricus túba reginæ in diarrhæa; Agáricus piperátus in calculous disorders; Phállus Mokúsín against cancer; Polypórus annósus against the bites of serpents. Some Copríni are used for healing ulcers; Polypórus officinális as a purgative; Polypórus igniárius as a styptic; Polypórus destrúctor, and a number of others, constitute dry rot. For the poison of fungi, the roots of garlic, the leaves of parsley, and tincture of lacmus, are said to be remedies: so also is common spirit. Fungi swarm in all the coldest countries of the world, but as we approach the equator they are extremely rare; the place where they most flourish is Sweden, and the adjacent regions.

- Calyceine**, of or belonging to a calyx. *Cartónema*, g. 90. p. 30.
- Calyculated**, (46) having bracteolæ resembling an external or additional calyx. *Myosíris*, g. 1640. p. 661.
- Calyptra**, (47) literally an extinguisher; applied to the body which tips the theca of a moss, and the like. p. 895.
- Calyptrate**, having a covering resembling an extinguisher. *Erica coarctáta*, s. 5330.
- Calyptrate**, having a calyptra. *Actinophýllum*, g. 697. p. 117.
- Calyptriiformis**, shaped like a calyptra. *Marcgraávia*, g. 1163. p. 456.
- Campanulate**, (48) bell-shaped. *Cóstus*, g. 11. p. 1.
- Canaliculate**, channelled or furrowed. *Weissia acúta*, s. 14714.
- Cancellate**, latticed; resembling lattice-work. *Trigonélla cancelláta*, s. 10882.
- Canescent**, hoary, approaching to white. *Selágo canescens*, s. 86662.
- Capillary**, (49) very slender; resembling a hair. *Trichophorum*, g. 126. p. 31.
- Capitate**, (50) growing in a head. *Chloránthus*, g. 25. p. 1.
- Capitular**, growing in small heads. *Brýum*, g. 2240. (note.)
- Capituli**, small heads. *Réseda*, g. 1102. (note.)
- Capituliform**, formed like a small head. *Cenomýce*, g. 2349. p. 949.
- Carbonised**, burned to a coal. *Quércus sóber*, g. 2000. (note.)
- Carina**, (51) a keel like that of a boat; also the two lower petals of papilionaceous flowers. *Pongámia*, g. 1514. p. 598.
- Carinate**, keel-shaped. *Utricularía minor*, s. 329.
- Cariopsis**, (52) a one-celled, small, indehiscent pericarpium adhering to the seed which it contains, as the grain of grasses. *Hydrástis*, g. 1241. p. 459.
- Carios**, decayed. *Juniperus*, g. 2113. (note.)
- Carminative**, medicines which promote perspiration. *Pimpinélla ánisum*, s. 3562.
- Carnose**, fleshy. *Gymnóstomum Griffithsiánum*, s. 14671.
- Carpella**, (53) the small parts out of which compound fruit are formed. *Actinocárpum*, g. 860. (note.)
- Carpology**, the science which treats of the structure of fruits and seeds. p. 1056.
- Cartilage**, gristle. *Róchea odoratíssima*, s. 3368.
- Cartilaginous**, gristly. *Aspicárpum*, g. 29. p. 1.
- Cataplasma**, a plaster, or more properly a poultice. *Zingiber*, g. 10. (note.)
- Catarhal**, of or belonging to a cold. *Acácia*, g. 2427. (note.)
- Cathartic**, purgative. *Griatiola*, g. 43. (note.)
- Catkins**, (12) inflorescence of the natural order *Amentáceæ*. *Artocárpum*, g. 1935. p. 768.
- Caudate**, tailed, being like a tail. *Strophánthus*, g. 416. p. 111.
- Caudex**, the trunk or stem. *Cócos aculeáta*, s. 15321.
- Cauliclea**, (54) a small membranous process on which the pollen of orchideous plants is fixed. *Rodriguezia*, g. 1883. p. 743.
- Cauliscent**, acquiring a stem. *Trichónema cauliscens*, s. 642.
- Cauline**, produced on the stem. *Centránthus calcitrapæ*, s. 112.
- Cavescity**, having a burning quality. *Plumbágo*, g. 324. (note.)
- Cautery**, that which burns. *Artemisia*, g. 1721. (note.)
- Cellular**, composed of cells. *Eriocáulton septanguláre*, s. 1295.
- Centimetre** (55) is a French measure equal to $\frac{1}{1000}$ of near $\frac{1}{2}$ lines. *Palmílla*, g. 2265. (note.)
- Centuriae**, hundreds. *Buxbaómia*, g. 2236. (note.)
- Cephalic**, medicinal to the head. *Kämpferia*, g. 12. (note.)
- Ceraceous**, wax-like. *Peziza erúmpens*, s. 16273.
- Cernuous**, (56) nodding, drooping, or pendulous. *Cánna iridiflóra*, s. 17.
- Chaffy**, (57) bearing processes resembling chaff. *Eriophorum*, g. 125. p. 31.
- Chalaza**, (58) a spot on the seed, indicating where the vessels of the raphe terminate. *Eriobótrya*, g. 1137. p. 409.
- Channel-leaved**, (59) folded together so as to resemble a channel for conducting water. *Trichónema tubocóodium*, s. 640.
- Charlatanry**, quackery. *Mandragóra*, g. 447. (note.)
- Charring**, blackening by fire. *Quércus*, g. 2000. (note.)
- Chlorosis**, the green sickness, a disease so called. *Anthemis*, g. 1778. (note.)
- Cilice**, (60) hairs like those of the eyelash. *Plantágo subuláta*, s. 1707.
- Ciliary processes**, like eyelash hairs. p. 907.
- Ciliated**, eyelash-haired. *Lopézia cordáta*, s. 104.
- Ciliato-dentate**, toothed and fringed with hairs like eyelashes. *Cnicus heterophýllus*, s. 11445.
- Cinereous**, ash-colored, grey. *Grevillea cinérea*, s. 1417.
- Cingalese**, inhabitants of, or belonging to, Ceylon. *Plumbágo zeyláncia*, s. 1861.
- Circinately**, (61) curled round like a sharp crook. p. 539.
- Cirrhiferous**, bearing tendrils. *Gloriosa superba*, s. 4574.
- Cirrhose**, or *Cirrhous*, (62) tendrilled. *Bignónia únguis*, s. 8531.
- Clammy**, viscid, sticky. *Boerhaávia viscosa*, s. 109.
- Clathrate**, latticed, divided like lattice-work. *Solénia compressa*, s. 15270.
- Clavate**, club-shaped. *Curcúma comósa*, s. 85.
- Claviflose**, clubbed, or having club-like processes. *Chóndria clavellósa*, s. 15230.
- Clavus**, a name for the ergot, a disease in corn. *Festúca durisúcula*, g. 182. (note.)
- Claws**, (63) the taper base of a petal. *Cánna límbáta*, s. 8.
- Clinandrium**, (63) that part of the column of orchideous plants in which the anther lies. *Listéria*, g. 1876. p. 749.
- Clypeate**, (64) shaped like a Roman buckler. *Tupistra*, g. 757. p. 238.
- Cobwebbed**, covered with loose hairs, as if with a cobweb. *Anacámpseros arachnoides*, s. 6630.
- Cochleate**, (65) resembling the shell of a snail. *Rhéxia*, g. 900. p. 300.
- Cohering**, connected. *Prótea*, g. 231. p. 77.
- Collapsion**, the act of closing or falling together. *Sphæria hydrophóra*, s. 16466.
- Columella**, (66) the axis of the fruit of mosses. p. 874.
- Columnar**, formed like columns. *P'xia tucáta*, s. 623.
- Comminuted**, pulverised or pounded. *Línium*, g. 701. (note.)
- Comose**, this term is used to express a kind of inflorescence, which is terminated by sterile bractæ. *Maránta comósa*, s. 24.
- Compact**, close, solid. *Cypérus vegetus*, s. 895.
- Complicate**, folded together. *Rhopáta dentata*, s. 1447.
- Complicato-carinate**, folded together so as to form a sort of keel. *Fontinális antipyrética*, s. 14848.
- Compound**, used in botany to express the union of several things in one: thus, a compound umbel is formed by several simple umbels, a compound flower by several simple flowers, &c. *Alpina nántans*, s. 43.
- Compressed**, pressed together. *Salicórmia*, g. 22. p. 1.
- Concave**, hollow. *Zingiber mióga*, s. 54.
- Concentric**, points or lines at equal distances from a common centre. *Eúrycles ambóinésis*, s. 4077.
- Concrete**, hardened or formed into one mass. *O rurs*, g. 69. (note.)
- Cone**, (67) a particular kind of compound fruit. *Pentrophila*, g. 226. p. 76.
- Conferruminate**, united together, so as to be undistinguishable. *Olyñthia*, g. 1124. p. 449.

Confervoid, like *confervæ*. *Sporóchnus*, g. 2321. p. 956.
Confluent, running into one another. *Jasminum grandiflorum*, s. 181.
Conglobated, collected into a spherical form. *Dacrymyces moriformis*, s. 16300.
Conical, (68) resembling a cone. *Hedýchium heteromallum*, s. 16300.
Conico-hemispherical, (69) between conical and round. *Bryum cuspidatum*, s. 14830.
Conico-ovate, (70) between conical and ovate. *Pinus sylvestris*, s. 13502.
Conjugate, (71) joined in pairs: a term chiefly applied to leaves. *Piper cuneifolium*, s. 524.
Connate, (72) joined together at the base. *Calceolária parália*, s. 330.
